The expansion factor *Y* accounts for the change in density of a fluid as it passes from the valve inlet to the vena contracta and for the change in area of the vena contracta as the pressure drop is varied (contraction coefficient). Theoretically, *Y* is affected by all of the following:

1) Ratio of port area to body inlet area
2) Internal geometry of the valve
3) Pressure drop ratio, *x*
4) Reynolds number
5) Ratio of specific heats, *k*

The influence of items 1, 2, and 3 are defined by the factor x_T. Test data (see Driskell reference, *New Approach to Control Valve Sizing*) indicate that *Y* may be taken as a linear function of *x*, as shown in the following equation for a valve without attached fittings:

$$Y = 1 - \frac{x}{3F_k x_T} \qquad (\text{Limits } 1.0 \geq Y \geq 0.67) \qquad \text{(Eq. 21)}$$

For a valve with attached fittings, x_{TP} shall be substituted for x_T.

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:48 2005

For all practical purposes, Reynolds number effects may be disregarded in the case of compressible fluids. The effect of the ratio of specific heats is considered in Section 6.7.

6.4 Choked flow

If all inlet conditions are held constant and the differential pressure ratio (x) is increased by lowering the downstream pressure (p_2), the mass flow rate will increase to a maximum limit. Flow conditions where the value of x exceeds this limit are known as *choked flow*. Choking occurs when the jet stream at the vena contracta attains its maximum cross-sectional area at sonic velocity. This occurs at pressure ratios (p_1/p_{vc}) greater than about 2.0.

The value of x at the inception of choked flow conditions varies from valve to valve. It also varies with the piping geometry and with the thermodynamic properties of the flowing fluid. The factors involved are x_T (Section 6.5), x_{TP} (Section 6.6), and F_k (Section 6.7).

Choking affects the use of Equations 17 through 21 in the following manner: The value of x used in the equations must not exceed $F_k x_T$ or $F_k x_{TP}$, regardless of the actual value of x. The expansion factor Y at choked flow ($x \geq F_k x_{TP}$) is then at its minimum value of 2/3.

6.5 Pressure drop ratio factor x_T

For maximum accuracy, the pressure drop ratio factor x_T must be established by using the test procedures specified in ANSI/ISA S75.02 (see Annex J—References). Representative x_T values for valves are tabulated in Annex D. These representative values are not to be taken as actual. Actual values must be obtained from the valve manufacturer.

6.6 Pressure drop ratio factor with reducers or other fittings x_{TP}

When a valve is installed with reducers or other fittings, the pressure drop ratio factor of the assembly (x_{TP}) is different from that of the valve alone (x_T). For maximum accuracy, x_{TP} must be determined by test (see reference ANSI/ISA S75.02). When estimated values are permissible, the following equation may be used to determine x_{TP}:

$$x_{TP} = \frac{x_T}{F_p^2}\left(\frac{x_T K_i C_v^2}{N_5 d^4} + 1\right)^{-1} \qquad \text{(Eq. 22)}$$

In this equation, x_T is the pressure drop ratio factor for a given valve installed without reducers or other fittings, and K_i is the sum of the inlet velocity head coefficients ($K_1 + K_{B1}$) of the reducer or other fitting attached to the valve inlet. This correction to x_T is usually negligible if d/D is greater than 0.5 and C_v/d^2 is less than 20, where d is in inches.

See Annex H for the mathematical derivation of x_T.

6.7 Ratio of specific heats factor F_k

The ratio of specific heats of a compressible fluid affects the flow rate through a valve. The factor F_k accounts for this effect. F_k has a value of 1.0 for air at moderate temperatures and pressures, where its specific heat ratio is about 1.40. Both theoretical and experimental evidence indicate that for valve sizing purposes, F_k may be taken as having a linear relationship to k. Therefore:

$$F_k = \frac{k}{1.40} \qquad \text{(Eq. 23)}$$

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:48 2005

6.8 Compressibility factor *Z*

Equations 18, 19, and 20 do not contain a term for the actual specific weight of the fluid at upstream conditions. Instead, this term is inferred from the inlet pressure and temperature based on the laws of ideal gases. Under some conditions, real gas behavior can deviate markedly from the ideal. In these cases, the compressibility factor Z shall be introduced to compensate for the discrepancy. Z is a function of both reduced pressure and reduced temperature. For use in this section, reduced pressure p_r is defined as the ratio of the actual inlet absolute pressure to the absolute thermodynamic critical pressure for the fluid in question. The reduced temperature is defined similarly. That is:

$$p_r = \frac{p_1}{p_c} \qquad \text{(Eq. 24)}$$

$$T_r = \frac{T_1}{T_c} \qquad \text{(Eq. 25)}$$

Absolute thermodynamic critical pressures and temperatures for most fluids, and curves from which Z may be determined, can be found in many reference handbooks of physical data.

Annex A — Use of flow rate equations for sizing valves

Laboratory tests are conducted on actual valves in a prescribed test setup (see reference ANSI/ISA S75.02). The test fluid is usually water or air. The flow coefficient C_v and the factors F_L, x_T, etc. are determined at the rated valve travel. These data, along with factors to account for the actual fluid and the pipe configuration (F_k, F_F, F_p, etc.), are used in the equations of this standard to predict the flow rate with the valve fully open.

The principal use of the flow equations is to aid in the selection of an appropriate valve size for a specific application. In this procedure, the numbers in the equations consist of known values for the fluid and flow conditions and known values for the selected valve type at its rated opening. With these factors in the equation, the unknown (or product of unknowns, e.g., F_pC_v) can be computed. Although these computed numbers are often suitable for selecting a valve from a series of discrete sizes, they do not represent a true operating condition, because the factors are mutually incompatible. Some of the factors used in the equation are for the wide-open valve while others relating to the operating conditions are for the partially open valve.

Once a valve size has been selected, the remaining unknowns, such as F_p, can be computed and a judgment can be made as to whether the valve size is adequate. It is not usually necessary to carry the calculations further to predict the exact valve opening. To do this, all the pertinent sizing factors must be known at fractional valve openings.

Additional information on the use of the flow equations, along with example problems, is available in *ISA Handbook of Control Valves* and Driskell reference, *Control Valve Selection and Sizing*.

Annex B — Derivation of factors F_p and F_{LP}

If a valve is installed between reducers, the C_v of the entire assembly is different from that of the valve alone. If the inlet and outlet reducers are the same size, the only effect is the added resistance of the fittings, which creates an additional pressure drop. If there is only one reducer or if there are reducers of different sizes, there will be an additional effect on the pressure due to the difference in velocity between the inlet and outlet streams.

The velocity head expressed in feet of fluid equals $U_2/2g$, where U is the velocity of the stream and g is the acceleration of gravity. Expressed in U.S. customary units, psi, gpm, and inches, the velocity pressure becomes:

$$p = \frac{q^2 G_f}{890 d^4} \qquad \text{(Eq. B-1)}$$

For a resistance coefficient K, the pressure difference then becomes:

$$\Delta p = K\left(\frac{q^2 G_f}{890 d^4}\right) \qquad \text{(Eq. B-2)}$$

From Equations 1 and B-2, the resistance coefficient for a valve is:

$$K_{valve} = \frac{890 d^4}{C_v^2} \qquad \text{(Eq. B-3)}$$

The change in velocity pressure across a reducer with diameters d and D is

$$\frac{q^2 G_f}{890 d^4} - \frac{q^2 G_f}{890 D^4} = \frac{q^2 G_f}{890 d^4}\left(1 - \frac{d^4}{D^4}\right) \qquad \text{(Eq. B-4)}$$

From Equations B-2 and B-4, we have the factor K_B, which has been called the Bernoulli coefficient.

Here,

$$K_B = \left(1 - \frac{d^4}{D^4}\right) \qquad \text{(Eq. B-5)}$$

By definition:

$$(F_P C_v)^2 = \frac{q^2 G_f}{\Delta p} \qquad \text{(Eq. B-6)}$$

From Equations B-2 and B-6, adding all K factors:

$$(F_P C_v)^2 = \frac{890 d^4}{K_{\text{valve}} + K_1 + K_2 + K_{B1} - K_{B2}} \qquad \text{(Eq. B-7)}$$

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:49 2005

Substitute K_{valve} from Equation B-3:

$$(F_P C_v)^2 = \frac{890 d^4}{\frac{890 d^4}{C_v^2} + \Sigma K} \qquad \text{(Eq. B-8)}$$

where

$$\Sigma K = K_1 + K_2 + K_{B1} - K_{B2} \qquad \text{(Eq. B-9)}$$

Then, rearranging Equation B-8, we have:

$$F_p = \left(\frac{\Sigma K C_v^2}{890 d^4} + 1 \right)^{-1 \S 2} \qquad \text{(Eq. B-10)}$$

It should be noted in Equation B-9 that ΣK is the sum of all the effective velocity head coefficients. If the inlet and outlet reducers are the same size, $K_{B1} = K_{B2}$, and in Equation B-9 both drop out because of the difference in their sign. For K_1 and K_2, see Equations 6 and 7.

By definition, from Equation 15:

$$F_L^2 = \frac{p_1 - p_2}{p_1 - p_{vc}} = \frac{\Delta p_a}{\Delta p_{vc}} \qquad \text{(Eq. B-11)}$$

where Δp_a is the pressure drop across the valve, and Δp_{vc} is the drop to the vena contracta.

Also, from Equation 1:

$$q^2 = (F_P C_v)^2 \frac{\Delta p_b}{G_f} = C_v^2 \frac{\Delta p_a}{G_f} \qquad \text{(Eq. B-12)}$$

where Δp_b is the drop across the valve with reducers.

From Equation B-12:

$$\Delta p_a = F_P^2 \Delta p_b \qquad \text{(Eq. B-13)}$$

Substituting this expression into Equation B-11, we have:

$$F_L^2 = F_P^2 \frac{\Delta p_b}{\Delta p_{vc}} \qquad \text{(Eq. B-14)}$$

By definition:

$$(F_L)_p^2 = \frac{\Delta p_b}{\Delta p_{vc} + \Delta p_i} \qquad \text{(Eq. B-15)}$$

where $(F_L)_P$ is the pressure recovery factor for the valve with reducers, and Δp_i is the drop across the inlet reducer.

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:49 2005

From Equation B-2:

$$\Delta p_i = \frac{K_i q^2 G_f}{890 d^4} \qquad \text{(Eq. B-16)}$$

where $K_i = K_1 + K_{B1}$.

Substituting the expression for q^2 from Equation B-12 into Equation B-16, we have:

$$\Delta p_i = \frac{K_i F_p^2 C_v^2 \Delta p_b}{890 d^4} \qquad \text{(Eq. B-17)}$$

Substituting Equations B-14 and B-17 into B-15, we have the following development:

$$(F_L)_p^2 = \frac{\Delta p_b}{\frac{F_P^2 \Delta p_b}{F_L^2} + \frac{K_i F_p^2 C_v^2 \Delta p_b}{890 d^4}}$$

$$(F_L)_p = \frac{1}{F_p}\left(\frac{1}{F_L^2} + \frac{K_i C_v^2}{890 d^4}\right)^{-1/2}$$

$$F_{LP} = (F_L)_p F_P = \left[\frac{1}{F_L^2} + \frac{K_i}{890}\left(\frac{C_v}{d^2}\right)^2\right]^{-1/2}$$

$$F_{LP} = F_L\left[\frac{F_L^2 K_i}{N_2}\left(\frac{C_v}{d^2}\right)^2 + 1\right]^{1/2} \qquad \text{(Eq. B-18)}$$

Annex C — Control valve-piping system head changes

An understanding of the various loss mechanisms involved in a control valve-piping system can be obtained by looking at the energy grade lines and the hydraulic grade lines for a liquid flow system containing abrupt contractions and expansions in the form of concentric reducers. These are shown schematically in Figure C-1. For ease of comprehension, the curves are displayed as straight line segments. The energy grade line includes only the available energy and excludes internal energy. Each point of pressure change associated with this figure is defined below. Some of the pressure drops are nonrecoverable and some are recoverable, as shown in the hydraulic grade line. The terms below also define the various coefficients associated with the system. The Bernoulli coefficients, K_{B1} and K_{B2}, account for the change in the velocity pressure of the stream and relate the total kinetic energy to that calculated with the valve inlet velocity U_1.

Table C-1 — Definitions of head terms (Refer to Figure C-1)

Reference Letter (See Fig. C-1)	Head Terms*	U.S. Units	SI Units
A	Inlet pressure head	p_1 / γ	$p_1 / \rho g$
B	Inlet velocity head	$(d/D_1)^4(U_1^2/2g)$	$(d/D_1)^4(U_1^2/2g)$
C	Reducer drop	$(K_1+K_{B1})(U_1^2/2g)$	$(K_1+K_{B1})(U_1^2/2g)$
D	Differential to vena contracta	$(E) / (1-F_L^2)$	$(E) / (1-F_L^2)$
E	Pressure recovery at valve	$(D) - (H)$	$(D) - (H)$
F	Increaser recovery	$(K_{B2} - K_2)(U_1^2 / 2g)$	$(K_{B2} - K_2)(U_1^2 / 2g)$
G	Reducer loss	$K_1(U_1^2/2g)$	$K_1(U_1^2/2g)$
H	Valve loss	$N_2(d^4/C_v^2)(U_1^2/2g)$	$N_2(d^4/C_v^2)(U_1^2/2g)$
I	Increaser loss	$K_2(U_1^2/2g)$	$K_2(U_1^2/2g)$
J	Outlet pressure head	p_2 / γ	$p_2 / \rho g$
K	Outlet velocity head	$(d/D_2)^4(U_1^2/2g)$	$(d/D_2)^4(U_1^2/2g)$
L	Total head loss	$(p_1 - p_2) / \gamma$	$(p_1 - p_2) / \rho g$

* All units are absolute and consistent: pound, foot, and second in U.S. customary units; SI for metric units.

Annex D — Representative values of valve capacity factors

The values in Table D-1 are typical only for the types of valves shown at their rated travel for full-size trim. Significant variations in value may occur because of any of the following reasons: reduced travel, trim type, reduced port size, and valve manufacturer.

Table D-1 — Representative values of valve capacity factors

Valve Type	Trim Type	Flow Direction*	x_T	F_L	F_s	F_d**	$C_v/d^{2\dagger}$
GLOBE							
Single port	Ported plug	Either	0.75	0.9	1.0	1.0	9.5
	Contoured plug	Open	0.72	0.9	1.1	1.0	11
		Close	0.55	0.8	1.1	1.0	11
	Characterized cage	Open	0.75	0.9	1.1	1.0	14
		Close	0.70	0.85	1.1	1.0	16
	Wing guided	Either	0.75	0.9	1.1	1.0	11
Double port	Ported plug	Either	0.75	0.9	0.84	0.7	12.5
	Contoured plug	Either	0.70	0.85	0.85	0.7	13
	Wing guided	Either	0.75	0.9	0.84	0.7	14
Rotary	Eccentric spherical plug	Open	0.61	0.85	1.1	1.0	12
		Close	0.40	0.68	1.2	1.0	13.5
ANGLE	Contoured plug	Open	0.72	0.9	1.1	1.0	17
		Close	0.65	0.8	1.1	1.0	20
	Characterized cage	Open	0.65	0.85	1.1	1.0	12
		Close	0.60	0.8	1.1	1.0	12
	Venturi	Close	0.20	0.5	1.3	1.0	22
BALL	Segmented	Open	0.25	0.6	1.2	1.0	25
	Standard port (diameter ≅ 0.8d)	Either	0.15	0.55	1.3	1.0	30
BUTTERFLY	60-Degree aligned	Either	0.38	0.68	0.95	0.7	17.5
	Fluted vane	Either	0.41	0.7	0.93	0.7	25
	90-Degree offset seat	Either	0.35	0.60	0.98	0.7	29

* Flow direction tends to *open* or *close* the valve, i.e., push the closure member away from or towards the seat.

** In general, an F_d value of 1.0 can be used for valves with a single flow passage. An F_d value of 0.7 can be used for valves with two flow passages, such as double-ported globe valves and butterfly valves.

† In this table, d may be taken as the nominal valve size, in inches.

Annex E — Reynolds number factor F_R

The information contained in this annex is an elaboration of the discussion presented in Section 4.4. It presents a method used for resolving laminar and transitional flow problems.

Figure E-1 shows the relationships between F_R and the valve Reynolds number Re_v for the three types of problems that may be encountered with viscous flow. These are:

a) Determining the required flow coefficient when selecting a control valve size

b) Predicting the flow rate that a selected valve will pass

c) Predicting the pressure differential that a selected valve will exhibit

In Figure E-1, the straight diagonal lines extending downward at an F_R value of approximately 0.3 indicate conditions under which laminar flow exists. At a valve Reynolds number of 40 000, all three curves in Figure E-1 reach an F_R value of 1.0. At this number and at all higher Re_v values, fully turbulent flow conditions exist. Between the laminar region, indicated by the straight diagonal lines of Figure E-1, and the turbulent region, where F_R = 1.0, the flow regime is transitional (i.e., neither laminar nor turbulent).

Equation 11 for determining the valve Reynolds number Re_v is:

$$Re_v = \frac{N_4 F_d q}{\nu F_L^{1/2} C_v^{1/2}} \left(\frac{F_L^2 C_v^2}{N_2 d^4} + 1 \right)^{1/4} \qquad \text{(Eq. 11)}$$

F_R values and the solutions to the three classes of problems may be obtained by using the following procedures.

Wed Feb 02 02:19:51 2005

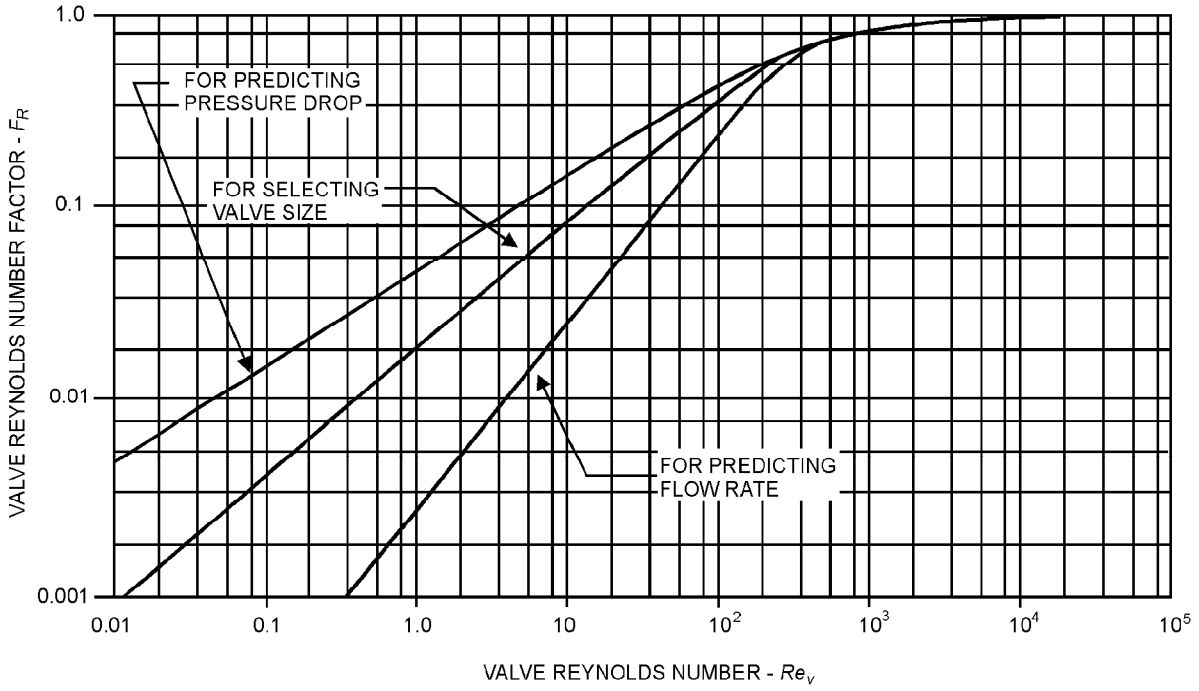

Figure E-1 — Reynolds number factor for valve sizing
(See Figure 1 for the range of uncertainty.)

Determining required flow coefficient (selecting valve size)

The following treatment is based on valves without attached fittings; therefore, F_p = 1.0.

a) Calculate a pseudo valve flow coefficient C_{vt}, assuming turbulent flow, using:

$$C_{vt} = \frac{q}{N_1 \sqrt{\frac{p_1 - p_2}{G_f}}} \qquad \text{(Eq. E-1)}$$

b) Calculate Re_v by using Equation 11, substituting C_{vt} from Step 1 for C_v. For F_L, select a representative value for the valve style desired.

c) Find F_R as follows:

1) If Re_v is less than 56, the flow is laminar, and F_R may be found by using either the curve in Figure E-1 labeled "For Selecting Valve Size" or by using the equation

$$F_R = 0.019\,(Re_v)^{0.67} \qquad \text{(Eq. E-2)}$$

2) If Re_v is greater than 40 000, the flow may be taken as turbulent, and F_R = 1.0.

3) If Re_v lies between 56 and 40 000, the flow is transitional, and F_R may be found by using either the curve in Figure E-1 or Table E-1 in the column headed "Valve Size Selection."

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:52 2005

d) Obtain the required C_v from:

$$C_v = \frac{C_{vt}}{F_R} \qquad \text{(Eq. E-3)}$$

e) After determining C_v, check the F_L value for the selected valve size and style. If this value is significantly different from the value selected in Step 2, use the new value and repeat Steps 1 through 4.

Predicting flow rate

a) Calculate q_t, assuming turbulent flow, using:

$$q_t = N_1 C_v \sqrt{\frac{p_1 - p_2}{G_f}} \qquad \text{(Eq. E-4)}$$

b) Calculate Re_v by using Equation 11, substituting q_t for q from Step 1.

c) Find F_R as follows:

1) If Re_v is less than 106, the flow is laminar, and F_R may be found by using the curve in Figure E-1 labeled "For Predicting Flow Rate" or by using the equation

$$F_R = 0.0027\ Re_v \qquad \text{(Eq. E-5)}$$

2) If Re_v is greater than 40 000, the flow may be taken as turbulent, and $F_R = 1.0$.

3) If Re_v lies between 106 and 40 000, the flow is transitional, and F_R may be found by using the curve in Figure E-1 or Table E-1 in the column headed "Flow Rate Prediction."

d) Obtain the predicted flow rate from:

$$q = F_R\, q_t \qquad \text{(Eq. E-6)}$$

Predicting pressure drop

a) Calculate Re_v according to Equation 11.

b) Find F_R as follows:

1) If Re_v is less than 30, the flow is laminar, and F_R may be found by using the curve in Figure E-1 labeled "For Predicting Pressure Drop" or by using the equation

$$F_R = 0.052\ (Re_v)^{0.5} \qquad \text{(Eq. E-7)}$$

2) If Re_v is greater than 40 000, the flow may be taken as turbulent, and $F_R = 1.0$.

3) If Re_v lies between 30 and 40 000, the flow is transitional, and F_R may be found by using the curve in Figure E-1 or Table E-1 in the column headed "Pressure Drop Prediction."

c) Obtain the predicted pressure drop from:

$$\Delta p = G_f \left(\frac{q}{N_1 F_R C_v} \right)^2 \qquad \text{(Eq. E-8)}$$

Annex F — Equations for nonturbulent liquid flow

The following method for handling liquid nonturbulent flow permits a direct solution for the unknown — flow rate, C_v, or Δp — without using tables or curves and without first computing a Reynolds number. It is especially useful with programmable calculators or computers. The results are in conformance with Section 4.4.

Figure 1 in Section 4.4 has the following features:

a) A straight horizontal line at $F_R = 1.0$, representing the turbulent flow region. Here, the flow rate varies as the square root of differential pressure (Equation 1).

b) A straight diagonal line, representing the laminar flow region. Here, the flow rate varies directly with the differential pressure.

c) A curved portion, representing the transitional flow region.

d) A shaded envelope to indicate the scatter of the test data (see Stiles reference, *Liquid Viscosity Effects on Control Valve Sizing*, and McCutcheon reference, *A Reynolds Number for Control Valves*) and the uncertainty to be expected in the nonturbulent flow region.

From Equation 9:

$$q = N_1 F_R C_v \sqrt{\frac{p_1 - p_2}{G_f}} \qquad \text{(Eq. 9)}$$

and Equation 11:

$$\mathrm{Re}_v = \frac{N_4 F_d q}{v F_L^{1/2} C_v^{1/2}} \left(\frac{F_L^2 C_v^2}{N_2 d^4} + 1 \right)^{1/4} \qquad \text{(Eq. 11)}$$

For the laminar flow region, an equation can be written for the straight line found in Figure 1, such that:

$$F_R = \left(\frac{\mathrm{Re}_v}{370} \right)^{1/2} \qquad \text{(Eq. F-1)}$$

Combining these three equations, we obtain:

$$q = N_s (F_s C_v)^{3/2} \frac{\Delta p}{\mu}$$

or

$$C_v = \frac{1}{F_s} \left(\frac{q\mu}{N_s \Delta p} \right)^{2/3} \qquad \text{(Eq. F-2)}$$

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:53 2005

where,

$$F_s = \frac{F_d^{2/3}}{F_L^{1/3}}\left(\frac{F_L^2 C_v^2}{N_2 d^4} + 1\right)^{1/6} \qquad \text{(Eq. F-3)}$$

and

μ = absolute viscosity, centipoises

N_s = a constant that depends on the units used, i.e.,

N_s	q	Δp
47	gpm	psi
1.5	m^3/hr	kPa
15	m^3/hr	bar

F_s is generally a function of a specific manufacturer's valve style and varies little from size to size. This variation is usually no greater than the uncertainty in the value of the factor F_d that accounts for the hydraulic radius. Representative values of F_s are listed in Annex D. Once a particular valve has been selected, the actual values of F_d, F_L, and C_v/d^2 may be used to compute F_s.

Equation F-2 may be solved directly for the unknown if the flow is fully laminar. In the transitional region, to avoid using a curve or table, the following equations have been established for determining F_R:

$$F_R = 1.044 - 0.358\left(\frac{C_{vs}}{C_{vt}}\right)^{0.655} \qquad \text{(Eq. F-4)}$$

$$F_R = 1.084 - 0.375\left(\frac{\Delta p_s}{\Delta p_t}\right)^{0.336} \qquad \text{(Eq. F-5)}$$

$$F_R = 1.004 - 0.358\left(\frac{q_t}{q_s}\right)^{0.588} \qquad \text{(Eq. F-6)}$$

In these equations, the subscript s denotes a value computed from Equation F-2 assuming laminar flow conditions, and the subscript t denotes a value computed from Equation 9 assuming turbulent flow conditions (F_R = 1.0).

When the value F_R calculated by the above equations is less than 0.48, the flow may be taken as laminar, and Equation F-2 governs. When F_R is greater than 0.98, the flow may be taken as turbulent, and Equation 9 governs (F_R is $\cong$ 1.0). The piping geometry factor F_p should not be used in either Equation 9 or Equation F-2, because the effect that close-coupled fittings have on nonturbulent flow through control valves has not been established. Also, the equation used in this standard for F_p is based on turbulent flow only. For maximum accuracy, a valve must be installed with a straight inlet pipe the same size as the valve. The length of the straight pipe should be sufficient for the stream to attain its normal velocity profile, a condition upon which the research data are based.

The following examples demonstrate how problems may be solved.

PROBLEM 1. Find the valve size.

Given: q = 500 gpm, G_f = 0.9, Δp = 20 psi, μ = 20 000 cp

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:53 2005

Selected valve: Butterfly, $C_v / d^2 = 19$, $F_s = 0.93$ (from a manufacturer's catalog or Annex D)

Using Equation 9 for turbulent flow:

$$q = N_1 F_R C_{vt} \left(\frac{\Delta p}{G_f}\right)^{1/2}$$

$$500 = (1.0)(1.0) C_{vt} \left(\frac{20}{0.90}\right)^{1/2}$$

$C_{vt} = 106$

Using Equation F-2 for laminar flow:

$$C_{vs} = \frac{1}{F_s}\left(\frac{q\mu}{N_s \Delta p}\right)^{2/3}$$

$$C_{vs} = \frac{1}{0.93}\left(\frac{500(20\,000)}{47(20)}\right)^{2/3} = 520$$

Using Equation F-4 for transitional flow,

$$F_R = 1.044 - 0.358\left(\frac{520}{106}\right)^{0.655} = 0.03$$

This value for F_R is less than the 0.48 limit for transitional flow, so the flow is laminar. The C_v required is 520. To meet this requirement, a representative 6-inch valve has a $C_v = 19d^2 = 684$, or as listed in the manufacturer's catalog.

PROBLEM 2. Find the differential pressure.

Given: $q = 1070$ gpm, $G_f = 0.84$, $\mu = 5900$ cp, $C_v = 400$, $F_s = 1.25$

Using Equation 9 assuming turbulent flow:

$$q = N_1 (1.0) C_v \left(\frac{\Delta p_t}{G_f}\right)^{1/2}$$

$$1070 = (1.0)(1.0)400\left(\frac{\Delta p_t}{0.84}\right)^{1/2}$$

$\Delta p_t = 601$ psi

Using Equation F-2 assuming laminar flow:

$$q = N_s (F_s C_v)^{3/2} \frac{\Delta p_s}{\mu}$$

$$1070 = 47[1.25(400)]^{3/2} \frac{\Delta p_s}{5900}$$

$\Delta p_s = 12.0$ psi

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:53 2005

Using Equation F-5 for transitional flow:

$$F_R = 1.084 - 0.375\left(\frac{12.0}{6.01}\right)^{0.336} = 0.61$$

Because F_R is between 0.48 and 0.98, the flow is transitional.

Find the pressure drop using Equation 9:

$$q = N_1 F_R C_v \left(\frac{\Delta p}{G_f}\right)^{1/2}$$

$$1070 = 1.0(0.61)(400)\left(\frac{\Delta p}{0.84}\right)^{1/2}$$

Δp = 16 psi

Note that the pseudo values of Δp, assuming turbulent (6 psi) or laminar flow (12 psi), are not applicable, because the flow is actually transitional.

PROBLEM 3. Find the valve size.

Given: q = 17 m³/h, ρ = 1100 kg/m³, Δp = 69 kPa, μ = 1000 N·s/m² (or 10^6 cp)

Selected valve: Ball, C_v / d^2 = 30, F_s = 1.3

Using Equation 9 for turbulent flow:

$$q = N_1 F_R C_{vt} \left(\frac{\Delta p}{G_f}\right)^{1/2}$$

$$17 = 0.0865(1.0) C_{vt}\left(\frac{69}{1.1}\right)^{1/2}$$

C_{vt} = 24.8

Using Equation F-2 for laminar flow:

$$C_{vs} = \frac{1}{F_s}\left(\frac{q\mu}{N_s \Delta p}\right)^{2/3}$$

$$C_{vs} = \frac{1}{1.3}\left[\frac{17(10^6)}{1.5(69)}\right]^{2/3}$$

C_{vs} = 2310

For transitional flow:

$$F_R = 1.044 - 0.358\left(\frac{2310}{24.8}\right)^{0.655} = -5.9$$

A value less than 0.48 indicates laminar flow. Therefore, the required C_v is 2310. To meet this requirement, a 250-mm (10-in) valve has a $C_v = 30(10)^2 = 3000$.

Annex G — Liquid critical pressure ratio factor F_F

Flow rate is a function of the pressure drop from the valve inlet to the vena contracta. Under nonvaporizing liquid flow conditions, the apparent vena contracta pressure (p_{vc}) can be predicted from the downstream pressure (p_2), because the pressure recovery is a consistent fraction of the pressure drop to the vena contracta. The effect of this pressure recovery is recognized in the valve flow coefficient (C_v).

Under choked flow conditions, there is no relationship between p_2 and p_{vc} because vaporization affects pressure recovery. The liquid critical pressure ratio factor is used to predict p_{vc}. It is the ratio of the apparent vena contracta pressure under choked flow conditions to the vapor pressure of the liquid at its inlet temperature.

An equation for predicting F_F has been published in previous standards. A theoretical equation based on the assumption (see Allen reference, *Flow of a Flashing Mixture of Water and Steam through Pipes and Valves*) that the fluid is always in thermodynamic equilibrium states that:

$$F_F = 0.96 - 0.28\left(\frac{p_v}{p_c}\right)^{1/2} \qquad \text{(Eq. G-1)}$$

Because a liquid does not remain in thermodynamic equilibrium as it flashes across a valve (see Bailey reference, *Metastable Flow of Saturated Water*), the actual flow rate will be greater than that predicted by the use of Equation G-1.

In experiments with nonvalve restrictions (see Burnell reference, *Flow of Boiling Water through Nozzles, Orifices and Pipes*), the following equation for F_F was derived:

$$F_F = 1 - \frac{\sigma}{F_o} \qquad \text{(Eq. G-2)}$$

where σ is the surface tension of the liquid in N/m and F_O is an experimentally determined orifice factor for the restriction or valve in the same units. This equation allows for the fact that liquids vaporizing across a restriction are not in thermodynamic equilibrium, but become metastable and choke at a critical vena contracta pressure. The equation has been tested only for deaerated water. Limited data indicate that values of F_O for values at rated travel range from around 0.2 N/m for a streamlined angle valve to nearly 1.0 for a more tortuous double-ported globe valve. The surface tension of water in N/m can be approximated based on the Othmer equation:

$$\sigma = \left[\frac{(374 - °C)}{4080}\right]^{1.05} \qquad \text{(Eq. G-3)}$$

or

$$\sigma = \left[\frac{(705 - °F)}{7340}\right]^{1.05} \qquad \text{(Eq. G-4)}$$

Annex H — Derivation of factor x_{TP}

The slope of the Y versus x curve for any specific valve is determined using air or gas as the test fluid, and is designated by the value of x at $Y = 2/3$. This value, known as x_T, is the pressure drop ratio factor. For most valves, it is less than 1.0, but it may be greater for some valve styles.

If a valve is installed with a fitting at the inlet and/or outlet, the pressure drop ratio factor for the combination of the valve plus the fitting (x_{TP}) usually differs from that of the valve alone.

Let us consider a valve with reducers operating at choked flow

[$x = x_{TP}$, $Y = Y_T$ for an ideal gas ($Z = 1$)]

From Equation 18, the volumetric valve flow equation (in U.S. customary units) is:

$$q_T = 1360\ F_P C_v p_1 Y_T \sqrt{\frac{x_{TP}}{G_g T_1}} \qquad \text{(Eq. H-1)}$$

where the subscript T indicates the terminal or choked condition. For the valve alone at choked flow, the equation is:

$$q_T = 1360\ C_v p_i Y_T \sqrt{\frac{x_T}{G_g T_1}} \qquad \text{(Eq. H-2)}$$

where p_i is the valve inlet pressure. From Equations H-1 and H-2, we have:

$$p_i = F_p p_1 \sqrt{\frac{x_{TP}}{x_T}} \qquad \text{(Eq. H-3)}$$

From the gas laws, the mean specific weight across the inlet reducer is:

$$\gamma_1 = \left(\frac{p_1 - p_i}{2}\right)\frac{M}{RT_1} = \frac{144(p_1 + p_i)}{2}\left(\frac{28.97 G_g}{1545\ T_1}\right)$$

$$\gamma_1 = 1.350(p_1 + p_i)\frac{G_g}{T_1} \qquad \text{(Eq. H-4)}$$

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:55 2005

Since the pressure drop, expressed in feet of head, is $K(U^2/2g)$,

$$\frac{144(p_1 - p_i)}{\gamma} = \frac{K}{2g} U^2 \qquad \text{or} \qquad \frac{144(p_1 - p_i)}{1.350(p_1 + p_i)\frac{G_g}{T_1}}$$

$$= \frac{K}{2g}\left[\frac{q}{3600}\frac{14.73}{0.5(p_1 + p_i)}\frac{T_1}{519.69}\frac{4(144)}{\pi d^2}\right]^2$$

Simplifying:

$$p_1^2 - p_i^2 = 1.214(10^{-9})KG_gT_1q^2d^{-4} \qquad \text{(Eq. H-5)}$$

Substituting the expression for p_i from Equation H-3, we have:

$$p_1^2 - F_p^2 p_1^2\left(\frac{x_{TP}}{x_T}\right) = 1.214(10^{-9})KG_gT_1q^2d^{-4} \qquad \text{(Eq. H-6)}$$

From Equation H-1:

$$q_T^2 G_g \frac{T_1}{p_1^2} = (1360\ F_pC_vY_T)^2 x_{TP} \qquad \text{(Eq. H-7)}$$

Substituting this into Equation H-6, with $q = q_T$ and $K = K_i$, we have:

$$1.214(10^9)(1360\ F_pC_vY_T)^2 K_i \frac{x_{TP}}{d^4} = 1 - F_p^2 \frac{x_{TP}}{x_T} \qquad \text{(Eq. H-8)}$$

Solving for x_{TP}, with $Y_T = 2/3$, we have:

$$x_{TP} = \frac{x_T}{F_p^2}\left(\frac{K_i x_T}{1000}\frac{C_v^2}{d^4} + 1\right)^{-1} \qquad \text{(Eq. H-9)}$$

Annex I — Control valve flow equations — SI Notation (International System of Units)

The valve flow coefficient that is compatible with SI units is A_v (see IEC reference, *Industrial Process Control Valves*). At the present time, A_v does not have wide acceptance by the technical community. This annex has been included for the benefit of those who wish to use pure, coherent SI units.

In the following equations, certain symbols commonly associated with SI practice differ from those listed in Section 3. These are:

A_v Valve flow coefficient, $m^2 [A_v = C_v \times 24(10^{-6})]$

ζ (Zeta) Head loss coefficient ($\zeta = K$), dimensionless

ρ (Rho) Density, kg/m^3

Liquid Equations

Turbulent flow:

$$q = F_p A_v \left(\frac{\Delta p}{\rho}\right)^{1/2} \quad \text{(Eq. I-1)}$$

$$w = F_p A_v (\Delta p \rho)^{1/2} \quad \text{(Eq. I-2)}$$

$$F_p = \left[\left(\frac{\Sigma \zeta A_v^2}{1.23 d^4}\right) + 1\right]^{-1/2} \quad \text{(Eq. I-3)}$$

Choked flow:

$$q = F_{LP} A_v \left[\frac{p_1 - p_{vc}}{\rho}\right]^{1/2} \quad \text{(Eq. I-4)}$$

$$w = F_{LP} A_v [\rho (p_1 - p_{vc})]^{1/2} \quad \text{(Eq. I-5)}$$

$$F_{LP} = F_L \left[\left(\frac{\zeta_1 F_L^2 A_v^2}{1.23 d^4}\right) + 1\right]^{-1/2} \quad \text{(Eq. I-6)}$$

where $\zeta_i = \zeta_1 + \zeta_{B1}$

$$p_{vc} = F_F p_v \text{ (See Annex G for } F_F) \quad \text{(Eq. I-7)}$$

Laminar flow (see Annex F):

$$q_s = (F_s A_v)^{3/2} \frac{\Delta p}{280 \mu} \quad \text{(Eq. I-8)}$$

Copyright by the The Instrumentation, Systems, and Automation Society
Wed Feb 02 02:19:56 2005

$$w_s = (F_s A_v)^{3/2} \frac{\Delta p \rho}{280 \mu} \quad \text{(Eq. I-9)}$$

$$F_s = \frac{F_d^{2/3}}{F_L^{1/3}} \left(\frac{F_L^2 A_v^2}{1.23 d^4} + 1 \right)^{1/6} \quad \text{(Eq. I-10)}$$

Transitional flow:

$$q = F_R A_v \left(\frac{\Delta p}{\rho} \right)^{1/2} \quad \text{(Eq. I-11)}$$

$$w = F_R A_v (\Delta p \rho)^{1/2} \quad \text{(Eq. I-12)}$$

$$F_R = 1.044 - 0.358 \left(\frac{A_{vs}}{A_{vt}} \right)^{0.655} \quad \text{(Eq. I-13)}$$

$$F_R = 1.084 - 0.375 \left(\frac{\Delta p_s}{\Delta p_t} \right)^{0.336} \quad \text{(Eq. I-14)}$$

$$F_R = 1.004 - 0.358 \left(\frac{q_t}{q_s} \right)^{0.588} \quad \text{(Eq. I-15)}$$

Limits for F_R = 0.48 to 1.0.

Gas and Vapor Equations

Turbulent flow:

$$w = F_p A_v Y (x p_1 \rho_1)^{1/2} \quad \text{(Eq. I-16)}$$

$$q = 0.246 F_p A_v p_1 Y \left(\frac{x}{M T_1 Z} \right)^{1/2} \quad \text{(Normal m}^3\text{ at 0°C and 101.3 kPa)} \quad \text{(Eq. I-17)}$$

Limit: $x \leq F_k x_{TP}$ (in equation only)

$$x_{TP} = \frac{x_T}{F_p^2} \left[\left(0.72 x_T \zeta_i \frac{A_v^2}{d^4} \right) + 1 \right]^{-1} \quad \text{(Eq. I-18)}$$

where

$$\zeta_i = \zeta_1 + \zeta_{B1} \quad \text{(Eq. I-19)}$$

FOREWORD

ASME B16.9 is the American Standard for steel butt-welding fittings and although not so stated, it is implied that its scope deals primarily with the schedules of wall thicknesses which are common to carbon steel and the grades of alloy steel piping that are selected for pressure and temperature considerations.

The rapid expansion of the process industries in the field of chemicals, plastics, textiles, etc., has created a demand for a class of pipe referred to as stainless piping, using this word in its generic sense. This field employs the use of the austenitic stainless steels and also nickel and its related alloys. This stainless piping is used with resistance to corrosion, elimination of product contamination, or combination of the two as the principle reason for material selection. Pressure is seldom, if ever, a critical consideration.

When pressure is a consideration reference is made to ASME B16.9.

Mechanical strength, resistance to vacuum, and economy, are the most usual criteria in the selection of pipe thickness in this field, and for this reason the wall thicknesses employed in the field of corrosion resistant pipe are lighter than those in common usage with carbon steel piping.

In 1949 ANSI approved standard B36.19 Stainless Steel Pipe in which a schedule of wall thickness was established and designated as Schedule 10S. Numerous companies were also using a wall thickness lighter than Schedule 10S for services where contamination rather than corrosion was the prime consideration. These lighter wall thicknesses were designated Schedule 5S and the original 1950 edition of SP-43 established a series of Schedule 5S fittings. The 5S thicknesses were published in SP-43 and were developed in cooperation with representatives of the various principal chemical companies and processing industries. In 1952 the Stainless Steel Pipe Standard B36.19 was revised to recognize the Schedule 5S wall thickness pipe as American Standard.

The purpose of this standard is to provide industry with a set of dimensional standards for butt-welding fittings that can be used with these light wall pipes of corrosion resisting materials. The center-to-end dimensions of all fittings are identical with those in ASME B16.9 which give to industry the advantage of uniform design room practice and a maximum utilization of existing die equipment. The only departure from this is in the lap-joint stub end where for purposes of economy the face-to-end of the product has been reduced for use with thin wall piping.

The advantage of longer center-to-end dimensions of the size 3/4 elbows resulted in the change in the tables to permit a gradual changeover, providing the manufacturers ample time to deplete existing stocks, re-tool and replenish stocks.

The 1991 revision of the SP was required to delete the metric equivalents.

The 2001 Reaffirmation had no technical changes. There were minor editorial changes. The precedence of the longer dimensions for 3/4 elbows was made in accord with ASME B16.9. Referenced standards were brought up to date. The title of 180 degree returns was clarified.

WROUGHT STAINLESS STEEL, BUTT-WELDING FITTINGS

1. SCOPE

1.1 This Standard covers overall dimensions, tolerances, and markings for wrought stainless steel butt-welding fittings. In this standard "wrought" is used to denote fittings made of pipe, tubing, plate, bar, sheet, strip or forgings.

1.2 This Standard covers only fittings made for use with Schedule 5S or 10S pipe as given in ASME B36.19M, except that short pattern stub ends suitable for use with Schedule 40S are also shown.

1.3 Annex A. Table A1 lists the dimensions of stainless steel pipe with which these fittings are intended to be used.

2. REFERENCES

2.1 Standards and specifications adopted by reference in this standard are shown in Annex B for convenience of identifying edition number, date, and source of supply.

3. PRESSURE RATINGS

3.1 Fittings produced under this standard shall carry the following ratings: [Schedule 5S piping is not recommended for use at temperatures above 400° F].

Temp	PSI	
F	10S	5S
100	275	225
150	255	215
200	240	200
250	225	190
300	210	175

3.2 Fabricated Tees employing intersection welds shall be considered in this standard and shall be rated at 70% of these ratings.

3.3 For fittings of same pressure rating of matching pipe, refer to ASME B16.9.

4. SIZE

4.1 The size of the fittings in Tables 1 through 6 and Annex A is identified by the corresponding nominal pipe size.

5. MARKING

5.1 Each fitting shall be marked to show the following:

a) Manufacturer's name or trademark
b) "CR" followed by the material identification symbol established for the respective grade in the appropriate ASTM or AISI specifications.
c) Schedule number or nominal wall thickness designation.
d) Size

5.2 Where the size of fittings does not permit complete marking, the identification marks may be omitted in the sequence specified in MSS SP-25.

5.3 Method of Marking – The manufacturer's name or trademark, thickness, the grade identification symbol, and size shall be marked by any suitable method not injurious to the fitting.

Wed Feb 02 02:20:53 2005

6. MATERIALS

6.1 Fittings made from AISI Type 304, 304L, 347, 316, and 316L are considered standard under this specification. Fittings to other specifications are available and should be made from material complying with the requirements of one of the recognized AISI analyses of ASTM specifications.

7. METAL THICKNESS

7.1 As these fittings are to match pipe, the dimensions of the welding ends must conform with established pipe standards as to outside diameters and tolerances. The nominal wall thickness of the fittings shall be the same as the pipe to which it is welded, except that fittings with heavier walls may be butt welded to lighter wall pipe provided the heavier wall is tapered on the inside or outside to match the dimensions of the lighter pipe.

8. FITTINGS DIMENSIONS

8.1 Inch dimensions for the fittings covered by this standard are given in Tables 1 through 6.

8.2 One of the principals of this standard is the maintenance of a fixed position for welding ends with reference to center line of the fittings or the overall dimensions as the case may be.

9. TESTS

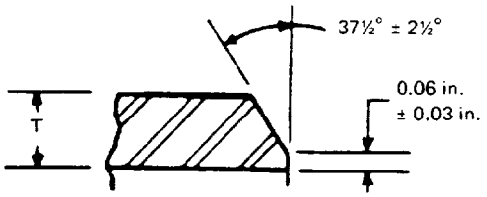
9.1 Hydrostatic testing of fittings is not required in this standard; however, fittings shall be capable of withstanding a hydrostatic test pressure one and one-half times the pressure ratings shown in Subsection 3.1 for 100°F.

10. TOLERANCES

10.1 Table 1 lists the tolerances for the fittings covered by this standard.

11. WELDING BEVEL

11.1 Fittings furnished to this standard may be finished with ends cut square for wall thickness 0.12 in. or less. For wall thicknesses in excess of 0.12 in., they shall be beveled at 37 1/2° plus or minus 2 1/2°; with root face (land) 0.06 in. plus or minus 0.03 in.



Welding Bevel for "T" in excess of 0.12 in.

12. FINISH AND HEAT TREATMENT

12.1 The fittings shall be satisfactorily heat treated by an accepted practice, and adequately cleaned to insure maximum corrosion resistance.

SP-86-1997	Guidelines for Metric Data in Standards for Valves, Flanges, Fittings and Actuators
SP-87-1991	(R 96) Factory-Made Butt-Welding Fittings for Class 1 Nuclear Piping Applications
SP-88-1993	Diaphragm Type Valves
SP-89-1998	Pipe Hangars and Supports - Fabrication and Installation Practices
SP-90-2000	Guidelines on Terminology for Pipe Hangers and Supports
SP-91-1992	(R 96) Guidelines for Manual Operations of Valves
SP-92-1999	MSS Valve User Guide
SP-93-1999	Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components-Liquid Penetrant Examination Method
SP-94-1999	Quality Std for Ferritic and Martensitic Steel Castings for Valves, Flanges, and Fittings and Other Piping Components-Ultrasonic Examination Method
SP-95-2000	Swage(d) Nipples and Bull Plugs
SP-96-1996	Guidelines on Terminology for Valves and Fittings
SP-97-1995	Integrally Reinforced Forged Branch Outlet Fittings-Socket Welding, Threaded and Buttwelding Ends
SP-98-1996	Protective Coatings for the Interior of Valves, Hydrants, and Fittings
SP-99-1994	Instrument Valves
SP-100-1997	Qualification Requirements for Elastomer Diaphragms for Nuclear Diaphragm Type Valves
SP-101-1989	Part-Turn Valve Actuator Attachment-Flange and Driving Component Dimensions and Performance Characteristics
SP-102-1989	Multi-Turn Valve Actuator Attachment - Flange and Driving Component Dimensions and Performance Characteristics
SP-103-1995	(R 00) Wrought Copper and Copper Alloy Insert Fittings for Polybutylene Systems
SP-104-1995	Wrought Copper Solder Joint Pressure Fittings
SP-105-1996	Instrument Valves for Code Applications
SP-106-1990	(R 96) Cast Copper Alloy Flanges and Flanged Fittings, Class 125, 150 and 300
SP-107-1991	(R 00) Transition Union Fittings for Joining Metal and Plastic Products
SP-108-1996	Resilient-Seated Cast Iron-Eccentric Plug Valves
SP-109-1997	Welded Fabricated Copper Solder Joint Pressure Fittings
SP-110-1996	Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
SP-111-1996	Gray-Iron and Ductile-Iron Tapping Sleeves
SP-112-1999	Quality Standard for Evaluation of Cast Surface Finishes - Visual and Tactile Method. This SP must be sold with a 10-surface, three dimensional Cast Surface Comparator, which is a necessary part of the Standard. Additional Comparators may be sold separately at $25.00 each. Same quantity discounts apply on total order.
SP-113-2001	Connecting Joint between Tapping Machines and Tapping Valves
SP-114-1995	Corrosion Resistant Pipe Fittings Threaded and Socket Welding, Class 150 and 1000
SP-115-1999	Excess Flow Valves for Natural Gas Service
SP-116-1996	Service Line Valves and Fittings for Drinking Water Systems
SP-117-1996	Bellows Seals for Globe and Gate Valves
SP-118-1996	Compact Steel Globe & Check Valves - Flanged, Flangeless, Threaded & Welding Ends (Chemical & Petroleum Refinery Service)
SP-119-1996	Belled End Socket Welding Fittings, Stainless Steel and Copper Nickel
SP-120-1997	Flexible Graphite Packing System for Rising Stem Steel Valves (Design Requirements)
SP-121-1997	Qualification Testing Methods for Stem Packing for Rising Stem Steel Valves
SP-122-1997	Plastic Industrial Ball Valves
SP-123-1998	Non-Ferrous Threaded and Solder-Joint Unions for Use With Copper Water Tube
SP-124-2001	Fabricated Tapping Sleeves
SP-125-2000	Gray Iron and Ductile Iron In-Line, Spring-Loaded, Center-Guided Check Valves
SP-126-2000	Steel In-Line Spring-Assisted Center Guided Check Valves

(R YEAR) Indicates year standard reaffirmed without substantive changes

A large number of former MSS Practices have been approved by the ANSI or ANSI Standards, published by others. In order to maintain a single source of authoritative information, the MSS withdraws its Standard Practice in such cases.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract or public law, as applicable.

Substantive changes in this 1996 edition are "flagged" by parallel bars as shown on the margins of this paragraph. The specific detail of the change may be determined by comparing the material flagged with that in the previous edition.

Non-toleranced dimensions in this Standard Practice are nominal, and unless otherwise specified, shall be considered "for reference only".

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-44, 1996, with permission of the publisher, the Manufacturers Standardization Society.' Reproduction prohibited under copyright convention unless written permission is granted by the Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.

FOREWORD

The Manufacturers Standardization Society originally developed the Standard Practice in response to the continued requests for steel pipe flanges for pipeline use, particularly in sizes larger than those covered by ANSI Standard B16.5 on Steel Pipe Flanges and Flanged Fittings. The line pipe is uniquely characterized by high-strength, cold worked, thin-wall of the carbon steel grade, which necessitates special considerations for the welding end of the flanges.

The size and pressure class range was originally NPS 26 through NPS 36 in pressure classes customarily designated in ANSI Standard B16.5 as 300, 400, 600, and 900 lb. The 1970 edition deleted the slip-on flanges for lack of demand, and added a 150 lb. class and coverage for sizes NPS 12 through NPS 24. Additional coverage was also necessitated by the advent of the use of line pipe of grades having minimum specified yield strength higher than the 52,000 psi maximum contemplated at the time of initial development, and therefore still thinner walls.

In some instances, this advent widened the differential between the tensile properties of the flange steel versus that of the mating pipe steel. This, in turn necessitated greater flexibility in the selection of hub dimensions, so that various combinations of material-strength and flange-dimensions could be utilized to supply the flanges. Section 5 on Flange Design was introduced at this point, and is one of the key features of this standard. The 1972 edition included the coverage of blind flanges in all pressure classes and clarification of text requirements for better understanding and usage under the more diverse conditions.

The 1975 edition expanded the size range above size NPS 36. The drilling templates for the Class 150 flanges of the NPS 38 and larger sizes continued the previous philosophy of adopting the drilling template of the Class 125 of ANSI Standard B16.1. However, the drilling templates of the Class 300 flanges of the NPS 38 and larger sizes did not continue the adoption of the Class 250 of ANSI Standard B16.1 drilling templates, nor did the NPS 38 and larger sizes of Classes 400, 600, and 900 continue the extrapolation of ANSI B16.5 drilling templates; instead, these drilling templates were necessarily designed more compactly because of the increased loads. While these flanges are designated by the customary ANSI Standard Class 150, 300, 400, 600, and 900, their use is almost entirely confined to cross country transmission pipelines at atmospheric temperatures. The flanges have been designed primarily for use at their cold ratings which conform to the ANSI Standard B16.5 ratings of 100F, and are intended primarily for attachment to relatively thin-wall, high-strength cold worked pipe, and high-strength butt-welding fittings in pipeline service at temperatures of 450F and lower. However, flanges forged of other materials are capable of pressure temperature ratings as specified in Paragraph 2.2.

The 1980 edition was created to bring the document into closer editorial alignment with ANSI B16.5. However, out of recognition of the successful experience of the pipeline industry, room temperature ratings were extended to 250F. De-rating above 250F was accelerated such that the 450F ratings are the same as B16.5. Users are cautioned that when these flanges are bolted to valves and used at temperatures between 100F and 450F, the rating of the valve will not be as high as the flange.

The 1990 revision of this SP was required to update the reference standards list and delete the metric equivalents.

The 1991 revision of this SP was required to add blind flange machining guidance, flat face requirements and precautionary notes as well as update of referenced standards.

The 1996 revision adds a table with permissible imperfections in flange facing finish and clarifies annex A design criteria. There were several errata, or corrections made to references to other standards. Dimensional tolerances have been changed where necessary to conform with ASME B16.5 and B16.47.

1. SCOPE

1.1 General — This standard covers pressure-temperature ratings, materials, dimensions, tolerances (by reference to ASME/ANSI B16.5), marking and testing. The welding neck type flanges shall be forged steel, and the blind flanges may be made of either forged steel or from steel plates.

1.1.1 Dimensional requirements for sizes NPS 10 and smaller are provided by reference to ASME/ANSI B16.5. When such flanges meet all other stipulations of this standard, they shall be considered as complying therewith.

1.2 References

1.2.1 Referenced Standards — Standards and specifications adopted by reference in this standard are shown in Annex C, for convenience of identifying edition number, date and source of supply.

A flange made in conformance with a prior edition of referenced standards and in all other respects conforming to this standard will be considered to be in conformance even though the edition reference may be changed in a subsequent revision of this Standard Practice.

1.2.2 Codes and Regulations — A flange used under the jurisdiction of the ASME Boiler and Pressure Vessel Code, the ANSI Code for Pressure Piping, or Governmental Regulations, is subject to any limitation of that code or regulation. This includes any maximum temperature limitation for a material, or rule governing the use of a material at a low temperature.

2. PRESSURE-TEMPERATURE RATINGS

2.1 General Flanges covered by this standard shall be designated as one of the following: Class 150, 300, 400, 600 and 900. Ratings in Table 3 are in U.S. customary units.

2.2 Rating for Other Materials and Temperatures above 450 F — NPS 26 and larger flanges forged of steels covered in ASME/ANSI B16.5 whose bores are no larger than those which may be calculated for pipe complying with parallel ASTM pipe specifications, and which comply with all requirements (except dimensions) of American National Standard B16.5 are capable of being utilized at the pressure-temperature ratings given in that standard.

3. MATERIALS

3.1 The steel used in the manufacture of these flanges shall be selected by the manufacturer to meet the following requirements.

3.1.1 All materials used for flanges shall be killed steel.

3.1.2 The steel used shall be suitable for field welding to other flanges, fittings, or pipe manufactured under ASTM specifications A 105, A 53, A 106, A 350, A 381, A 694, A 707, or API Standard 5L.

3.1.3 The steel used shall have a maximum carbon content of 0.35 and a carbon equivalent computed by the following equation:

$$\text{C.E.} = \text{C} + \frac{\text{Mn}}{6} + \frac{\text{Cr} + \text{Mo} + \text{V}}{5} + \frac{\text{Ni} + \text{Cu}}{15}$$

that should not exceed 0.48%, based on ladle analysis. If the carbon equivalent factor exceeds 0.48%, the acceptance of the flanges shall be based on agreement between purchaser and manufacturer.

3.1.3.1 The choice and use of alloying elements, combined with the elements within the limits prescribed in paragraph 3.1.3 to give the required tensile properties prescribed in paragraphs 3.1.4 shall be made by the flange manufacturer and included and reported in the ladle analysis to identify the type of steel.

3.1.4 The steel used shall have tensile properties conforming to the requirements prescribed in Table 1 and capable of meeting the requirements of section 4 and the flange manufacturer's design conditions as given in Annex A.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:21:26 2005

3.1.4.1 The test specimens may be taken from the forgings or, at the manufacturers' option, from the billets or forging bar entering into the finished product, provided such test blank has undergone relatively the same forming and the equivalent heat treatment as the finished flange. The dimensions of the test blank must be such as to adequately reflect the heat treatment properties of the hub of the flange. Specimens shall be obtained from the midwall of the thinnest section of the hub of the flange or ¾ in. from the surface of the test blank. The orientation of specimens taken from a flange shall be longitudinal.

3.2 Bolting — Bolting listed in Table 2 shall be used in flanged joints covered by this standard. Bolting of other material may be used if permitted by the applicable code or governmental regulation. All bolting materials are subject to the following limitations.

3.2.1 High Strength Bolting — Bolting materials having allowable stresses not less than those for ASTM A193 Gr B7 are listed as high strength in Table 2. These and other materials of comparable strength may be used in any flanged joint.

3.2.2 Intermediate Strength Bolting — Bolting materials listed as intermediate strength in Table 2, and other bolting of comparable strength, may be used in any flanged joint, provided the user verifies their ability to seat the selected gasket and maintain a sealed joint under expected operating conditions.

3.2.3 Low Strength Bolting — Bolting materials having not more than 30 ksi specified minimum yield strength are listed as low strength in Table 2. These materials and others of comparable strength shall be used only in Class 150 and Class 300 joints, and only with gaskets described in 3.3.2.

General Note:

Bolting materials shall not be used beyond temperature limits specified in the governing Code.

NOTES:

(a) These bolting materials may be used with all listed materials and gaskets.

(b) These bolting materials may be used with all listed materials and gaskets; provided it has been verified that a sealed joint can be maintained under rated pressure and temperature.

(c) These bolting materials may be used with all listed materials but are limited to Class 150 and Class 300 joints. See 3.3 for recommended gasket practices.

(d) This ferritic material is intended for low temperature service, use A194 Gr. 4 or Gr. 7 nuts.

(e) This special alloy is intended for high temperature service with austenitic stainless steel.

(f) This austenitic stainless steel has been carbide solution treated and strain hardened. Use A194 nuts of corresponding material.

(g) This austenitic stainless material has been carbide solution treated but not strain hardened. Use A194 nuts of corresponding material.

(h) This carbon steel fastener shall not be used above 400 F or below -20 F, see also Note (c). Bolts with drilled or undersized heads shall not be used.

(i) Acceptable nuts for use with quenched and tempered bolts are A194 Gr. 2 and Gr. 2H. Mechanical property requirements for studs shall be the same as those for bolts.

TABLE 3. PRESSURE-TEMPERATURE RATINGS
MAXIMUM ALLOWABLE NON-SHOCK WORKING PRESSURES
IN POUNDS PER SQUARE INCH (GAGE)

TEMP. F	CLASS 150	CLASS 300	CLASS 400	CLASS 600	CLASS 900
-20 to 250	285	740	990	1480	2220
300	275	715	955	1430	2145
350	265	690	925	1380	2070
400	255	665	890	1330	2000
450	245	640	860	1285	1925

3.3 Gasket Material

3.3.1 The user is responsible for selection of gasket materials which will withstand the expected bolt loading without injurious crushing, and which are suitable for the service conditions. Particular attention should be given to gasket selection if a system hydrostatic test will exceed the test pressure specified in 8.2. Such a test involves the risk of excessive flange distortion.

3.3.2 Gasket dimensions for 1/16 inch sheet asbestos in Table 4 are based on a contact area equal to approximately twice the bolt root area. Class 150 flanged joints should use these exclusively.

3.3.3 Ring joint gasket materials shall conform to ANSI B16.20 with dimensions as given in Table 5.

3.3.4 Sheet and ring joint gaskets for sizes NPS 10 and smaller shall conform to ASME/ANSI B16.5 dimensions and recommendations.

4. HEAT TREATMENT

4.1 The F42 and higher grades of flanges of all pressure classes and the class 400 and higher classes of Grade F36 flanges shall be normalized or quenched and tempered.

4.2 It is recognized that the cooling rate in a quenching operation may be slower in the thicker ring section of the flange than in the thinner hub section. Hence, the increase in yield strength due to the quenching operation may be less in the ring section than in the hub section. This factor is accounted for in the Section on Design in Paragraph 5.3. NPS 38 and larger sizes of the 300 and higher classes of welding neck flanges shall have 42 ksi minimum yield strength in the ring section.

5. FLANGE DESIGN

5.1 Drilling Templates — Drilling templates are derived as follows:

5.1.1 Class 150 flange drilling templates are the same as ASME/ANSI B16.5 and Class 125 of ANSI/ASME B16.1.

5.1.2 Sizes 24 and smaller class 300 flanges have drilling templates which are the same as ASME/ANSI B16.5 and Class 250 of ANSI/ASME B16.1. Sizes 24 through 36 inclusive have drilling templates which are interpolations of Class 250 of ANSI/ASME B16.1 except the diameter of the bolt holes are only one-eighth inch larger than bolt diameters. Larger sizes are designed in accordance with Appendix 2 of Division 1 of Section VIII of ASME Boiler and Pressure Vessel Code.

5.1.3 Size 36 and smaller of Classes 400, 600, and 900 flanges have drilling templates which are extrapolations from ASME/ANSI B16.5. Larger sizes are designed in accordance with Appendix 2 of Division I of Section VIII of ASME Boiler and Pressure Vessel Code.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:21:27 2005

5.2 Flange Ring Design — The outside diameter and flange thickness of sizes NPS 24 and smaller flanges are in accordance with ASME/ANSI B16.5. Larger sizes are designed in accordance with Appendix 2 of Division 1 of Section VIII of ASME Boiler and Pressure Vessel Code and the flange ring shall have sufficient pressure capacity for the service based on its strength in the normalized condition. This capacity shall be substantiated by the Rules for Bolted Flange Connections, Appendix 2 of Division 1 of the ASME Unfired Pressure Code Section VIII, with allowable design stresses as given in Annex A of this standard.

5.3 Hub Design

5.3.1 Sizes NPS 24 and smaller. When the mechanical (minimum yield strength) properties of all sections of the flanges are equal to or higher than those of the pipe to be matched, the hub dimensions may be the same as those of ASME/ANSI B16.5. Larger sizes are designed in accordance with Appendix 2 of Section VIII of ASME Boiler and Pressure Vessel Code.

5.3.2 In addition, when the minimum yield strength of the hub portion of any flange or its representative test specimen is less than that specified for the pipe to be matched, the minimum thickness of the hub at the welding end shall be such that the product of its thickness times its yield strength (at welding end) shall at least equal the product of the specified nominal wall thickness and minimum specified yield strength of the pipe to be matched. Under these conditions, Sizes NPS 24 and smaller flanges may also have a single taper hub and the outside diameter of the hub at the base may be modified in accordance with ASME Section VIII Division 1 Appendix 2 calculations.

5.3.3 When the manufacturer employs this option, the flange identification should be a combination of the class of material of the flange and of the pipe for which the flange has been designed. See 6.1.

5.3.4 When the hub thickness at the welding end must be greater than the adjoining pipe, the joint design shall be as shown in any of the three sketches in Figure 1.

5.4 Welding End — The welding end shall be in accordance with Figure 2 for wall thickness (of intended mating pipe) of 0.88 in. and less. For thicker walls, refer to Figure 3.

5.5 Blind Flange

5.5.1 a) The outside diameter and thickness of blind flanges shall be as listed in Tables 6, 7, 8, 9 and 10. Thicknesses listed are based on material having mechanical properties for Grade F36 of Table 1. Drilling templates are per Paragraph 5.1. Thinner flanges of higher strength material may be furnished in accordance with Annex B rules.

5.5.2 b) Blind flanges need not be faced in the center if, when this center is raised, its diameter is at least 5 in. smaller than the nominal pipe size. When the center part is depressed, its diameter shall not be greater than the gasket ID specified in Table 4 less 2 inches (I.D. - 2 = max. depression O.D.).

5.6 Dimensional requirements for NPS 10 and smaller shall be in accordance with ASME/ANSI B16.5.

5.7 Flat Face Flanges — This standard permits flat face flanges in all classes, by providing flanges having either the full thickness or the thickness with the raised face removed, without reduction of the pressure-temperature ratings subject to the following provisions.

5.7.1 The thickness of a Class 150 or 300 flange from which the raised face has been removed shall be no less than the applicable dimension C of Tables 6 & 7 minus 0.06 in.

5.7.2 The thickness of a flange of Class 400 or higher from which the raised face has been removed shall be no less than the applicable C dimension of Tables 8, 9 and 10.

5.7.3 The flange facing shall conform with section 7.2 for the full width of seating of the gasket.

5.8 Spot Facing — All flanges shall have bearing surfaces for bolting which shall be parallel to the flange face within 1 deg. Any back facing or spot

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:21:27 2005

facing required to accomplish parallelism shall not reduce the flange thickness C below the dimensions given in Tables 6, 7, 8, 9 and 10. Any spot facing or back facing shall be in accordance with MSS SP-9.

6. MARKING

6.1 Flanges shall be marked in accordance with the rules established in MSS Standard Practice SP-25, Standard Marking System for Valves, Fittings, Flanges, and Unions. In addition, the letters, "PL" shall precede the grade symbol marking. The grade symbol marked on the Welding Neck Flange shall designate the grade of material in the welding end of the hub. When flanges are produced under the option of Paragraph 5.3.1, the marking will also include the grade of the material of the pipe which the flange will match. For example, a flange having a grade F42 hub designed to be used with grade X60 pipe would contain the marking PL F42/X60 in addition to the marking specified in MSS SP-25.

6.2 Flanges in sizes NPS 10 and smaller produced to B16.5 dimensions and complying with all other requirements of this Standard Practice shall be marked in accordance with 6.1.

7. FACINGS

7.1 Flange Facing Finish — The finish of contact faces of pipe flanges shall be judged by visual comparison with Ra Standards (see ANSI B46.1) and not by instruments having stylus tracers and electronic amplification. The finishes required are given below. Other finishes may be furnished by agreement between user and manufacturer.

7.2 Raised Face — Either a serrated-concentric or serrated-spiral finish having from 125 μ in. to 250 μ in. average shall be furnished. The cutting tool employed should have an approximate 0.06 in. or larger radius, and there should be from 44 to 55 grooves per in.

7.3 Ring Joint — The side wall surface of gasket groove shall not exceed 63 microinch roughness.

7.4 Flange Facing Finish Imperfections in the flange facing finish shall not exceed the dimensions shown in Table 11. Adjacent imperfections shall be separated by a distance of at least four times the permissable radial projection. Protrusions above the separations are not allowed.

8. CODE LIMITATIONS

8.1 A product used under the jurisdiction of the ASME Boiler and Pressure Vessel Code or of the ANSI Code for Pressure Piping, is subject to any limitation of that code. This includes any maximum temperature limitation for a material, or a code rule governing the use of a material at a low temperature.

8.2 Flange Testing — Flanges are not required to be hydrostatically tested. Flanged joints may be subjected to system hydrostatic tests at pressures not exceeding 1.5 times the 100 F rating.

9. FLANGE BOLTING DIMENSIONS

9.1 Alloy-steel stud-bolts threaded at both ends or full length, or bolts with hexagonal heads conforming to American National Standard heavy dimensions (ANSI B18.2.1) may be used and shall have nuts conforming to American National Standard heavy dimensions (ANSI B18.2.2).

9.2 Carbon Steel bolts smaller than ¾ in. shall have square heads or heavy hex heads (ANSI B18.2.1), and shall have heavy hex nuts (ANSI B18.2.2). Bolts ¾ in. and larger shall have square heads or hex heads (ANSI B18.2.1), and shall have hex nuts or heavy hex nuts (ANSI B18.2.2).

9.3 Threads of carbon steel bolts and stud bolts shall be coarse series, Class 2A (ANSI B1.1), and nuts shall be coarse series, Class 2B.

9.4 All alloy steel bolting shall be threaded in accordance with ANSI B1.1. Nominal diameters 1 in. and smaller shall be of the coarse thread series; nominal diameters 1⅛ in. and larger shall be of the 8 thread series. Bolts, studs and stud-bolts shall have a Class 2A thread, and nuts shall have a class 2B thread.

Wed Feb 02 02:21:27 2005

9.5 Bolting to Cast Iron Flanges — Where Class 150 steel flanges are bolted to Class 125 cast iron flanges or Class 300 steel flanges are bolted to Class 250 cast iron flanges, it is recommended that low strength bolting be used. If intermediate or high-strength bolting is used, it is recommended that the mating flanges be flat faced and that full faced gaskets extending to the O.D. of the flange be used.

10. TOLERANCES

10.1 Facings

Outside Diameter, 0.06 in. raised face:
Sizes NPS 12 to NPS 24 inclusive: ±0.03 in.
Sizes NPS 26 and Larger: ±0.08 in.

Outside Diameter, 0.25 in. raised face:
Sizes NPS 12 to NPS 24 inclusive: ±0.02 in.
Sizes NPS 26 and Larger: ±0.04 in.

10.2 Flange Thickness

Sizes NPS 18 and Smaller	+0.12 in. −zero
Sizes NPS 20 and larger	+0.19 in. −zero

10.3 Hub Dimensions (including welding ends)

10.3.1 Nominal Outside Diameter of Welding End of welding neck flanges (Dimension H, in Tables 6, 7, 8, 9 and 10.

Sizes NPS 12 to NPS 24 in.	+0.16 in. −0.03 in.
Sizes NPS 26 and larger	+0.21 in. −0.06 in.

10.3.2 Nominal Inside Diameter of Welding Ends of welding neck flanges (Dimension B in the referenced Figures).

Sizes NPS 12 to 18 inclusive	±0.06 in.
Sizes NPS 20 and larger	+0.12 in. −0.06 in.

10.3.3 Thickness of Hub — Regardless of tolerances specified for dimensions A and B, the thickness of hub at the welding end shall never be less than 87½ percent of the nominal thickness of the pipe to which the flange is to be attached.

10.4 Overall Length through Hub on Welding Neck Flanges

Sizes NPS 12 to NPS 24 incl.	+0.12 in. - 0.18 in.
Sizes NPS 26 and larger	±0.19 in.

10.5 Drilling and Facing

10.5.1 Bolt Circle Diameter, ±0.06 in.

10.5.2 Center-to-Center of adjacent bolt holes, ±0.03 in.

10.5.3 Eccentricity between bolt circle diameter and machined facing diameters.

Sizes NPS 12 to NPS 24, incl.	0.06 in.
Sizes NPS 26 and larger	0.09 in.

10.6 Sizes NPS 10 and Smaller Tolerances for these sizes shall be as specified in ASME/ANSI B16.5.

The listing of decimal tolerances does not imply method of measurement.

NOTES:

GENERAL:

When the minimum specified yield strengths of the sections to be joined are unequal, the deposited weld metal shall have mechanical properties at least equal to those of the section having the higher strength, and the minimum thickness, t_D, shall at least equal t times the ratio of minimum specified yield strength of pipe and flange, but not to exceed 1.5t.

(a) Neither t_1, t_2, nor $t_1 + t_2$ shall exceed 0.5t.

58	71.00	5.06	9.25	59.38	48	1.88	67.25	64.00	0.50
60	73.00	5.19	9.44	61.38	52	1.88	69.25	66.00	0.50

General Notes:

For matching tolerances see Section 10.

For matching end detail see Figures 1, 2 and 3.

(a) Rating for raised face flanges is predicated on the use of sheet gaskets shown in Table 2.

(b) Dimensions to be specified by customer.

(c) See Section 5.

(d) Where calculated blind thickness is less than the mating welding neck, the thicknesses were made equal. See paragraph 5.5 for material requirements.

General Notes:

For matching tolerances see Section 10.

For welding end detail see Figures 1, 2 and 3.

Notes: (a) Rating for raised face flanges is predicated on the use of sheet gaskets shown in Table 2.

(b) Dimensions to be specified by customer.

(c) See Section 5.

(d) Where calculated blind thickness is less than the mating welding neck, the thicknesses were made equal. See paragraph 5.5 for material requirements.

(e) Hub dimension for Size 24 and smaller flanges may vary as explained in paragraph 5.3.2.

General Notes:

For matching tolerances see Section 10.

For welding end detail see Figures 1, 2 and 3.

Notes: (a) Rating for raised face flanges is predicated on the use of sheet gaskets shown in Table 2.

(b) Dimensions to be specified by customer.

(c) See Section 5.

(d) Where calculated blind thickness is less than the mating welding neck, the thicknesses were made equal. See paragraph 5.5 for material requirements.

(e) Hub dimension for Size 24 and smaller flanges may vary as explained in paragraph 5.3.2.

General Notes:

For matching tolerances see Section 10.

For welding end detail see Figures 1, 2 and 3.

Notes: [a] Rating for raised face flanges is predicated on the use of sheet gaskets shown in Table 2.

[b] Dimensions to be specified by customer.

[c] See Section 5.

[d] Where calculated blind thickness is less than the mating welding neck, the thicknesses were made equal. See paragraph 5.5 for material requirements.

[e] Hub dimension for Size 24 and smaller flanges may vary as explained in paragraph 5.3.2.

TABLE 11 — PERMISSABLE IMPERFECTIONS IN FLANGE FACING FINISH[a]

NPS	MAXIMUM RADIAL[b] PROJECTION OF IMPERFECTIONS WHICH ARE NO DEEPER THAN THE BOTTOM OF THE SERRATIONS, IN.	MAXIMUM DEPTH AND RADIAL PROJECTION OF IMPERFECTIONS WHICH ARE DEEPER THAN THE BOTTOM OF THE SERRATIONS, IN.
12 - 14	0.31	0.18
16	0.38	0.18
18 - 24	0.50	0.25
26 - 36	0.50	0.25
38 - 48	0.56	0.28
50 - 60	0.62	0.31

NOTES: [a] Imperfections less than half the depth of the serrations shall not be cause for rejection. See paragraph 7.4.

[b] A radial projection shall be measured by the difference between an inner radius and an outer radius encompassing the imperfection where the radius is struck from the center line of the bore.

ANNEX A

DESIGN CRITERIA

This Annex is an integral part of this Standard Practice which is placed after the main text for convenience.

These flanges were designed in accordance with the formula of paragraphs UA 45 - UA 59 (inclusive) of Section VIII Unfired Pressure Vessel, Division 1. (1950ed.) Currently, the equivalent paragraphs are found in Appendix 2 of ASME Section VIII Division 1. This Annex is presented as a description of the basis for this Standard. Any deviations from the dimensions, material, or provisions of this standard are the responsibility of the User/ Designer. The maximum allowable stresses were established as follows.

	SIZES 12-36 incl. ksi	SIZES 38-60 incl. ksi
Longitudinal Hub Stress	30	30
Radial Flange Stress	20	25
Tangential Flange Stress	20	25
Average Stress	20	25
Bolt Stress (2½" and Smaller)	20	25
Bolt Stress (Larger than 2½")		23

1. The suggested ASME Section VIII, Division 1 values of 3700 and 2.75 for Y and M factors of 0.06 in. thick, flat, asbestos ring gaskets were assumed.

2. The widths of the gaskets were established as those whose surface areas would be at least twice the new bolt area.

3. For the Class 300, 400, 600 and 900 flanges, the slope and the O.D. of the hub at the base are designed for welding ends having equivalent yield strength and thickness as those of the mating pipe. The wall thickness of the intended mating pipe was based upon API 5LX-52 with a 0.68 design factor for the NPS 26-36 sizes, and API 5LX-65 with 0.72 design factor for the NPS 38 and larger sizes. When the manufacturer of the NPS 26-36 sizes elects to utilize the alternative permitted in paragraph 5.3.1, or when the mating pipe has a minimum specified yield strength exceeding 65,000 psi, it will be necessary for him to recalculate the design in accordance with the requirements of paragraph 5.3.1.

4. The design of the 38 NPS and larger sizes of the 300 and higher classes of welding neck flanges is predicated upon the flange material having a minimum specified yield strength of at least 42,000 psi in the ring section of the flange and a minimum yield at the welding end at least equal to that specified for the mating pipe. When the yield strength of the welding end of the flange is less than specified, compensation in accordance with paragraph 5.3.1.b may be made, but the hub slope and diameter at larger end must be preserved.

5. The design of all sizes is predicated on the use of heat treated carbon steel bolt studs for Class 150 flanges and alloy steel bolt studs for Class 300, 400, 600, and 900 flanges. Bolt diameters shall be ⅛ in. less than the bolt hole sizes shown in the tables.

ANNEX B
BLIND FLANGE DESIGN CRITERIA

This Annex is an integral part of this Standard Practice which is placed after the main text for convenience.

Blind flanges were designed in accordance with the formula of Paragraph UG34 of Section VIII (Pressure Vessels, Division 1) of the ASME Boiler and Pressure Vessel Code. The thicknesses listed in Tables 6, 7, 8, 9 and 10 were based on material having mechanical properties for Grade F36 of Table 1 with allowable stresses as listed below:

	SIZES 26-60
	KSI
Blind Flange Stress	26
	(1.5x17.5)

Where the calculated blind flange thickness is less than the mating welding neck, the thicknesses were made equal to the welding neck thicknesses.

Blind flanges may be produced using any of the higher strength grades of materials listed in Table 1. The thicknesses may then be reduced in accordance with the following formula, but in no case shall they be thinner than the corresponding welding neck flange:

$$E' = E \sqrt{\frac{60000}{UTS_F}}$$

where E' = Reduced blind flange thicknesses based on higher grade material.

$E^{(a)}$ = Present blind thickness based on F36 grade material (See Tables 6-10).

UTS_F = Tensile strength of higher grade material from Table 1.

Blinds produced to a thinner thickness from higher strength material should be identified in the marking with the higher grade material designation. All other marking required by Section 6 shall be included.

NOTE: [a] E' shall not be less than the corresponding welding neck flange thickness "C".

SP-89-1998	Pipe Hangars and Supports - Fabrication and Installation Practices
SP-90-2000	Guidelines on Terminology for Pipe Hangers and Supports
SP-91-1992	(R 96) Guidelines for Manual Operations of Valves
SP-92-1999	MSS Valve User Guide
SP-93-1999	Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components-Liquid Penetrant Examination Method
SP-94-1999	Quality Std for Ferritic and Martensitic Steel Castings for Valves, Flanges, and Fittings and Other Piping Components-Ultrasonic Examination Method
SP-95-2000	Swage(d) Nipples and Bull Plugs
SP-96-1996	Guidelines on Terminology for Valves and Fittings
SP-97-1995	Integrally Reinforced Forged Branch Outlet Fittings-Socket Welding, Threaded and Buttwelding Ends
SP-98-2001	Protective Coatings for the Interior of Valves, Hydrants, and Fittings
SP-99-1994	(R 01) Instrument Valves
SP-100-1997	Qualification Requirements for Elastomer Diaphragms for Nuclear Diaphragm Type Valves
SP-101-1989	Part-Turn Valve Actuator Attachment-Flange and Driving Component Dimensions and Performance Characteristics
SP-102-1989	Multi-Turn Valve Actuator Attachment - Flange and Driving Component Dimensions and Performance Characteristics
SP-103-1995	(R 00) Wrought Copper and Copper Alloy Insert Fittings for Polybutylene Systems
SP-104-1995	Wrought Copper Solder Joint Pressure Fittings
SP-105-1996	(R 01) Instrument Valves for Code Applications
SP-106-1990	(R 96) Cast Copper Alloy Flanges and Flanged Fittings, Class 125, 150 and 300
SP-107-1991	(R 00) Transition Union Fittings for Joining Metal and Plastic Products
SP-108-1996	Resilient-Seated Cast Iron-Eccentric Plug Valves
SP-109-1997	Welded Fabricated Copper Solder Joint Pressure Fittings
SP-110-1996	Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
SP-111-2001	Gray-Iron and Ductile-Iron Tapping Sleeves
SP-112-1999	Quality Standard for Evaluation of Cast Surface Finishes - Visual and Tactile Method. This SP must be sold with a 10-surface, three dimensional Cast Surface Comparator, which is a necessary part of the Standard. Additional Comparators may be sold separately at $25.00 each. Same quantity discounts apply on total order.
SP-113-2001	Connecting Joint between Tapping Machines and Tapping Valves
SP-114-2001	Corrosion Resistant Pipe Fittings Threaded and Socket Welding, Class 150 and 1000
SP-115-1999	Excess Flow Valves for Natural Gas Service
SP-116-1996	Service Line Valves and Fittings for Drinking Water Systems
SP-117-1996	Bellows Seals for Globe and Gate Valves
SP-118-1996	Compact Steel Globe & Check Valves - Flanged, Flangeless, Threaded & Welding Ends (Chemical & Petroleum Refinery Service)
SP-119-1996	Belled End Socket Welding Fittings, Stainless Steel and Copper Nickel
SP-120-1997	Flexible Graphite Packing System for Rising Stem Steel Valves (Design Requirements)
SP-121-1997	Qualification Testing Methods for Stem Packing for Rising Stem Steel Valves
SP-122-1997	Plastic Industrial Ball Valves
SP-123-1998	Non-Ferrous Threaded and Solder-Joint Unions for Use With Copper Water Tube
SP-124-2001	Fabricated Tapping Sleeves
SP-125-2000	Gray Iron and Ductile Iron In-Line, Spring-Loaded, Center-Guided Check Valves
SP-126-2000	Steel In-Line Spring-Assisted Center Guided Check Valves
SP-127-2001	Bracing for Piping Systems Seismic-Wind-Dynamic Design, Selection, Application

(R YEAR) Indicates year standard reaffirmed without substantive changes

A large number of former MSS Practices have been approved by the ANSI or ANSI Standards, published by others. In order to maintain a single source of authoritative information, the MSS withdraws its Standard Practice in such cases.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

This document has been substantively revised from the previous edition. It is suggested that if the user is interested in knowing what changes have been made, that direct page by page comparision should be made of this document with the 1995 edition.

Metric and U.S. Customary units are to be regarded separately as standard in this SP.

Any part of this standard may be quoted. Credit lines should read 'extracted from MSS SP-51, 2000, with permission of the publisher, the Manufacturers Standardization Society.' Reproduction prohibited under copyright convention unless written permission is granted by the Manufactures Standardization Society of the Valve and Fittings Industry, Inc.

FOREWORD

The subject matter of this Standard Practice was formerly a part of MSS SP-42, Corrosion Resistant Cast Flanged Valves, Flanges and Flanged Fittings. MSS SP-42 now covers valves only.

The 1978 revision of this Standard Practice was delayed beyond the normal review interval in consideration of extensive revisions being developed for SP-42. Following publication of the rewritten SP-42 1978, in which the flange thickness for most sizes were made the same as those in ANSI B16.5 Class 150, it was determined that a commercial need remained for flanges and flanged fittings of reduced weight, and that this standard should continue to serve that need. The committee decided, however, that pressure-temperature ratings should be reduced to limit pressure stresses to levels consistent with those applied in ANSI B16.5 Class 150 flanges. While pressure stresses are generally less significant than bolting and piping stresses in these flanges, the new ratings, in combination with the gasket selection recommended herein, serve to limit the assembly bolting loads required. It is intended that the reduction in ratings should substantially reduce the likelihood of misapplication of these flanges and fittings.

The 1982 and 1986 revisions of this SP were required to update the referenced standards list in Section 2.

The 1991 revision of this SP was required to update the reference standards list and delete the metric equivalents.

The 1995 reaffirmed edition of this Standard Practic was required to update the reference standards list and reaffirm the document.

The 2000 revision of this SP was required to incorporate standard metric dimensions, include forged and plate materials for flanges, and update reference standards.

CLASS 150LW, CORROSION RESISTANT CAST FLANGES AND FLANGED FITTINGS

1. SCOPE

This Standard Practice covers a series of cast austenitic type stainless steel flanged fittings and cast and forged type austenitic stainless steel flanges of reduced weight with mating dimensions for assembly with ISO 7005-1, PN20 or ASME B16.5, Class 150 flanges, but identified as Class 150LW (Light Weight) and limited to use at reduced pressure-temperature ratings.

2. STANDARD UNITS

The values stated in either metric units or customary units are to be regarded separately as standard. Within the text, the inch units are shown in parentheses. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the standard. Class 150 and NPS are the standard descriptors for Pressure Class and Nominal Size for both metric and customary products covered under this standard practice. PN an DN are shown only for reference purposes.

Table 2 and 3 show fittings dimensional requirements in millimeters. Tables 4 and 5 show the dimensional requirements for inch dimensioned fittings.

3. PRESSURE TEMPERATURE RATINGS

Ratings for flanges and flanged fittings conforming to this standard are shown in Table 1.

TABLE 1
PRESSURE TEMPERATURE RATINGS

Temperature °C	Pressure Rating (Bar)
-29 to 38	6.9
50	6.8
100	6.1
150	5.5
200	4.9
260	4.1
Temperature °F	**Pressure Rating (psig)**
-20 to 100	100
200	90
300	80
400	70
500	60

4. MATERIALS

4.1 Cast Flanges and fittings may be made using materials conforming to the following specifications.

a) ASTM A351/A351M	Gr. CF8
b) ASTM A351/A351M	Gr. CF8M
c) ASTM A351/A351M	Gr. CF8C
d) ASTM A351/A351M	Gr. CF3
e) ASTM A351/A351M	Gr. CF3M
f) ASTM A351/A351M	Gr. CN7M

4.2 Flanges may also be made from forgings or plates (blind flanges only) conforming to the following specifications:

a) ASTM A182/A182M	Gr. F304
b) ASTM A182/A182M	Gr. F316
c) ASTM A182/A182M	Gr. F347
d) ASTM A240/A240M	Gr. F304
e) ASTM A240/A240M	Gr. F316
f) ASTM A240/A240M	Gr. F347
g) ASTM B 462	Gr. N08020
h) ASTM B 463	Gr. N08020

5. DESIGN

5.1 Flanges shall be flat faced with serrated finish in accordance with MSS SP-6.

5.2 Flange assembly with flange having raised face is not recommended. Raised face of mating flange should be removed.

5.3 Flanges should be spot faced in conformance with MSS SP-9 or back faced if necessary to meet maximum tolerance on thickness through bolt holes.

5.3.1 Spot facing or back facing shall not reduce the thickness of flange below minimum specified in Table 2 or Table 4.

5.4 Threads of threaded flanges shall conform to ANSI/ASME B1.20.1 Pipe Threads. Threads shall be concentric with the axis of the flange and variations in alignment shall not exceed 1 mm in 200 mm (1/16" per ft.)

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:22:04 2005

5.4.1 Threads shall be countersunk a distance not less than one-half the pitch of the thread at an angle approximately 45 deg. with the axis of the thread, to provide easy entrance in assembly and for protection of the thread. The chamfer shall be concentric with the thread, and shall be included in measurements of thread length.

5.4.2 Variations in threading shall be limited to one turn large or one turn small from the gaging notch when using working gages. The reference point for gaging is the starting end of the fitting or flange, providing the chamfer does not exceed the major diameter of the internal thread. When a chamfer on the internal thread exceeds this limit, the reference point becomes the last thread scratch on the chamfer cone.

5.5 Flanged fitting dimensions shall be in conformance with Table 3 or Table 5.

5.5 .1 Reducing fittings shall be designated as shown in Figure 1.

6. FITTING TOLERANCES

6.1 Inspection tolerances shall be as follows:

NPS	DN	Center to Face		Face to Face	
		mm	Inches	mm	Inches
1/4 to 10	8≤DN≤250	±1	±1/32	±2	±1/16
12	DN300	±2	±1/16	±3	±1/8

7. GASKETS

Full face gaskets are recommended.

Caution: Since flanges conforming to this Standard Practice are reduced in thickness as compared with standard ISO 7005-1, PN 20 and B16.5 Class 150 flanges, proper flange joint assembly is critically important for satisfactory performance. Gaskets should be selected from Group Number IA in Figure E1 of ASME B16.5.

8. MARKING

8.1 Products conforming with this Standard Practice shall be marked as shown:

a) Manufacturer's name or trademark	A B Co
b) Class designation	150LW
c) Material designation	CF8
d) Melt identification	12345
e) Size (NPS)	6

8.2 At the option of the manufacturer, products may be marked PN20LW or 150LW/PN20LW.

8.3 At the option of the manufacturer, products may be marked with size in DN or NPS/DN.

9. TESTS

Flanged fittings shall be hydrostatic shell tested at 10.3 Bar (150psi).

Flanges are not tested.

12	300	304	485	27	432	12	M24	26	365	56

GENERAL NOTE: Dimensions in mm.

(a) The "Flange Thickness (Min)" as shown in the table is the dimension from the back of flange to gasket contact face. Tolerance on thickness is + 2 for flanges NPS 1/4 through 1-1/4, + 3 for flanges NPS 1-1/2 through 12.

(b) Blind flanges are recessed 2 mm with a diameter equal to the inside diameter of the flanged fitting.

(c) When flanges are integral with fittings, holes for bolts shall be drilled to straddle the center line.

(d) Flange diameters and drilling templates, NPS 1/2 and larger, correspond to those specified in ISO7005-1, PN20 and ASME B16.5, Class 150.

(e) Inch bolts shown in Table 4 fit into the bolt holes shown for these flanges.

GENERAL NOTES

(a) Dimensions in mm.
(b) Side outlet elbows have all openings on intersecting center lines.
(c) Reducing fittings have same center-to-face and face-to-face dimensions as straight size fittings corresponding to the size of the largest opening.
(d) Reducers and eccentric reducers for all reductions have same face-to-face dimensions as listed in the table for the larger opening.
(e) Class 150LW corrosion resistant fittings in NPS 1 and larger have center-to-face dimesnsions and flange diameters corresponding to those specified in ASME B16.5, Class 150. Flange diameters and drilling templates, NPS 1/2 and larger, correspond to those specified in ISO7005-1, PN 20 and ASME B16.5, Class 150.
(f) See Table 2 for bolt hole requirements.
(g) Flange dimensions to be in accordance with Table 2.

GENERAL NOTES

(a) Dimensions in inches.
(b) Side outlet elbows have all openings on intersecting center lines.
(c) Reducing fittings have same center-to-face and face-to-face dimensions as straight size fittings corresponding to the size of the largest opening.
(d) Reducers and eccentric reducers for all reductions have same face-to-face dimensions as listed in the table for the larger opening.
(e) Class 150LW corrosion resistant fittings in NPS 1 and larger have center-to-face dimesnsions, flange diameters and drilling templates corresponding to those specified in ASME B16.5, Class 150.
(f) See Table 4 for bolt hole requirements.
(g) Flange dimensions to be in accordance with Table 4.

Method of Designating Outlets of Reducing Fittings
FIGURE 1

In designating the outlets of reducing fittings the openings should be read in the order indicated by the sequence of the letters, a, b, c, and d. In designating the outlets of side outlet reducing fittings, the side outlet is named last, and in the case of the side outlet cross (which is not shown), the side outlet is designated by the letter "o."

SP-72-1999	Ball Valves with Flanged or Butt-Welding Ends for General Service
SP-73-1991	(R 96) Brazing Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings
SP-75-1998	Specification for High Test Wrought Butt Welding Fittings
SP-77-1995	Guidelines for Pipe Support Contractual Relationships
SP-78-1998	(R 92) Cast Iron Plug Valves, Flanged and Threaded Ends
SP-79-1999a	Socket-Welding Reducer Inserts
SP-80-1997	Bronze Gate, Globe, Angle and Check Valves
SP-81-1995	Stainless Steel, Bonnetless, Flanged, Knife Gate Valves
SP-82-1992	Valve Pressure Testing Methods
SP-83-1995	Class 3000 Steel Pipe Unions, Socket-Welding and Threaded
SP-85-1994	Cast Iron Globe & Angle Valves, Flanged and Threaded Ends
SP-86-1997	Guidelines for Metric Data in Standards for Valves, Flanges, Fittings and Actuators
SP-87-1991	(R 96) Factory-Made Butt-Welding Fittings for Class 1 Nuclear Piping Applications
SP-88-1993	Diaphragm Type Valves
SP-89-1998	Pipe Hangers and Supports - Fabrication and Installation Practices
SP-90-1986	(R 91) Guidelines on Terminology for Pipe Hangers and Supports
SP-91-1999	(R 96) Guidelines for Manual Operation of Valves
SP-92-1999	(R 92) MSS Valve User Guide
SP-93-1999	(R 92) Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components - Liquid Penetrant Examination Method
SP-94-1999	Quality Std for Ferritic and Martensitic Steel Castings for Valves, Flanges, and Fittings and Other Piping Components - Ultrasonic Examination Method
SP-95-1999	(R 91) Swage (d) Nipples and Bull Plugs
SP-96-1996	Guidelines on Terminology for Valves and Fittings
SP-97-1995	Integrally Reinforced Forged Branch Outlet Fittings - Socket Welding, Threaded and Buttwelding Ends
SP-98-1996	Protective Coatings for the Interior of Valves, Hydrants, and Fittings
SP-99-1994	Instrument Valves
SP-100-1997	Qualification Requirements for Elastomer Diaphragms for Nuclear Service Diaphragm Type Valves
SP-101-1989	Part-Turn Valve Actuator Attachment - Flange and Driving Component Dimensions and Performance Characteristics
SP-102-1989	Multi-Turn Valve Actuator Attachment - Flange and Driving Component Dimensions and Performance Characteristics
SP-103-1995	Wrought Copper and Copper Alloy Insert Fittings for Polybutylene Systems
SP-104-1995	Wrought Copper Solder Joint Pressure Fittings
SP-105-1996	Instrument Valves for Code Applications
SP-106-1990	(R 96) Cast Copper Alloy Flanges and Flanged Fittings, Class 125, 150 and 300
SP-107-1999	Transition Union Fittings for Joining Metal and Plastic Products
SP-108-1996	Resilient-Seated Cast Iron-Eccentric Plug Valves
SP-109-1996	Welded Fabricated Copper Solder Joint Pressure Fittings
SP-110-1996	Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
SP-111-1996	Gray-Iron and Ductile-Iron Tapping Sleeves
SP-112-1999	Quality Standard for Evaluation of Cast Surface Finishes - Visual and Tactile Method. This SP must be sold with a 10-surface, three-dimensional Cast Surface Comparator, which is a necessary part of the Standard. Additional Comparators may be sold separately at $19.00 each. Same quantity discounts apply on total order.
SP-113-1999	Connecting Joint between Tapping Machines and Tapping Valves
SP-114-1995	Corrosion Resistant Pipe Fittings Threaded and Socket Welding, Class 150 and 1000
SP-115-1999	Excess Flow Valves for Natural Gas Service
SP-116-1996	Service Line Valves and Fittings for Drinking Water Systems
SP-117-1996	Bellows Seals for Globe and Gate Valves
SP-118-1996	Compact Steel Globe & Check Valves - Flanged, Flangeless, Threaded & Welding Ends (Chemical & Petroleum Refinery Service)
SP-119-1996	Belled End Socket Welding Fittings, Stainless Steel and Copper Nickel
SP-120-1997	Flexible Graphite Packing System for Rising Stem Steel Valves (Design Requirements)
SP-121-1997	Qualification Testing Methods for Stem Packing for Rising Stem Steel Valves
SP-122-1997	Plastic Industrial Ball Valves
SP-123-1998	Non-Ferrous Threaded and Solder-Joint Unions for Use With Copper Water Tube

(R-YEAR) Indicates year standard reaffirmed without substantive changes

A large number of former MSS Practices have been approved by the ANSI or ANSI Standards, published by others. In order to maintain a single source of authoritative information, the MSS withdraws its Standard Practices in such cases.

ADOPTION NOTICE

MSS SP-58, "Pipe Hangers and Supports - Materials, Design and Manufacture," was adopted on 11 April 1994, and is approved for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Naval Construction Battalion Center, 1000 23rd Avenue, Code 156, Port Hueneme, CA 93043-4301. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from Manufacturers Standardization Society of the Valve and Fittings Industry, Inc., 127 Park Street, N.E, Vienna, VA 22180.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

FOREWORD

This standard was developed by a cooperative effort of representatives of the pipe hanger manufacturers. It is based on the best practice current at this time and on the collective experience of the industry. There are two companion standards, SP-69 and SP-89 relating to hanger selection, application, fabrication and installation as stated in subsections 2.4 and 2.5. In addition, the MSS Hanger Committee has developed guidelines for pipe supports contractural relationships and on hanger terminology as covered in SP-77 and SP-90 respectively.

U.S. customary units in this SP are the standard; the metric units are for reference only.

This document has been substantively revised from the previous edition. It is suggested that if the user is interested in knowing what changes have been made, that direct page by page comparison should be made of this document.

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-58, 1993, with permission of the publisher, the Manufacturers Standardization Society.' Reproduction prohibited under copyright convention unless written permission is granted by the Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.

PIPE HANGERS AND SUPPORTS—MATERIALS, DESIGN AND MANUFACTURE

1. SCOPE

1.1 This standard establishes the material, design, fabrication and inspection criteria to be used in the manufacture of standard types of pipe hanger components.

1.2 This standard also establishes minimum design load ratings for rigid pipe hanger assemblies (see Table 1).

1.3 This standard includes design criteria for springs and design characteristics for spring hangers.

1.4 Where applicable, design and manufacture of these products must also conform to Codes and Standards, such as:

ANSI/ASME B31 Codes for Pressure Piping,
ASME Boiler and Pressure Vessel Codes,
UL203 Standard for Pipe Hanger Equipment for Fire Protection Service,
Factory Mutual FM 1951 Approval Standard for Pipe Hanger Components for Automatic Sprinkler Systems,
Local Building Codes.

2. OBJECTIVES

2.1 To serve as a guide for pipe hanger material selection, design and manufacturing.

2.2 To enable the user to specify a minimum level of acceptance for pipe hanger design and performance.

2.3 To define types of hangers and supports which are illustrated in the Type Chart, Figure 1. Hangers and supports shown on the Type Chart indicate general types only and manufacturers' other standard products shall be accepteable under this standard if they meet dimensional and load rating limitations set forth in this standard.

2.4 To serve as a companion document to MSS SP-69 which provides recommendations for the selection and application of the types illustrated in the Type Chart, Figure 1.

2.5 To serve as a companion document to MSS SP-89 which provides recommendations for fabrication and installation of pipe hangers and supports.

3. MATERIAL STANDARDS

3.1 Materials commonly used in manufacturing pipe hangers and supports are listed in Tables 2 and A1.

3.2 Other materials may be used provided they comply with the allowable stress requirements of Subsection 4.4 or 4.6.

4. ALLOWABLE STRESSES, LOAD RATINGS, AND TEMPERATURES

4.1 The allowable Tensile Stress for materials commonly used in the design of pipe hangers and supports are listed in Tables 2 and A1. Allowable values for the types of stress stated in 4.1.1 thru 4.1.5, shall be computed by multiplying the allowable tensile stress by the applicable factor. Materials may not be used above the highest temperature for which a stress value appears.

		Factor
4.1.1	Tension:	
a)	On the Gross Area	1.0
b)	On the net section at pin holes	0.9
4.1.2	Bending	1.0
4.1.3	Shear	0.8
4.1.4	Bearing	1.5
4.1.5	Compression	1.0 (max)

Allowable Compressive stress must be reduced on the basis of structural stability and buckling (column action).

4.1.6 Combined Stress Check.

$$\frac{\text{Stress in Tension or Compression}}{\text{Allowable Tension or Compression}} + \frac{\text{Stress in Bending}}{\text{Allowable Bending}} \leq 1.0$$

4.2 Welds

4.2.1 Weld allowable shear stress shall be limited to 80% of the allowable tensile stress of the weaker of the base metals being joined. Weld tension and bending stress allowables shall be limited to the allowable tensile stress of the weaker of the base metals being joined.

4.3 Higher allowable stresses under well defined short-term loading conditions shall be as designated by the applicable codes.

4.4 Allowable tensile stresses for materials not listed in Tables 2 and A1, produced in accordance with a recognized specification and with known physical properties shall be determined as the lower of the following values:

a) 1/4 of minimum tensile strength at service temperature.
b) 5/8 of minimum yield strength at service temperature.

TABLE 1. MINIMUM DESIGN LOAD RATINGS FOR RIGID PIPE HANGER ASSEMBLIES

Applicable to all components of complete assembly; including pipe attachment, rod, fixtures and building attachment.			
Nominal Pipe or Tube Size		Ratings at Normal Temperature Range[2]	
Inch	mm	Pounds	Kilograms
3/8	10	150	65
1/2	15	150	65
3/4	20	150	65
1	25	150	65
1 1/4	32	150	65
1 1/2	40	150	65
2	50	150	65
2 1/2	65	170	75
3	80	210	95
3 1/2	90	250	110
4	100	300	135
5	125	400	180
6	150	530	240
8	200	760	345
10	250	1120	505
12	300	1480	670
14	350	1710	775
16	400	2030	920
18	450	2580	1170
20	500	2920	1325
24	600	4180	1895

Notes:

1. See Section 4 for allowable stresses and temperatures.
2. Normal temperature range is −20°F to 650°F (−29°C to 343°C) for carbon steel and −20°F to 450°F (−29°C to 231°C) for cast and malleable iron.
3. See Subsection 7.3 for minimum rod diameter restrictions.
4. For loads greater than those tabluated, hanger component load ratings shall be established by the manufacturer. Design shall be in accordance with all criteria as outlined in this document.
5. Pipe attachment ratings for temperature ranges between 650°F to 750°F (343°C to 398°C) shall be reduced by the ratio of allowable stress at service temperature to the allowable stresses at 650°F (343°C).
6. For services over 750°F (398°C), attachments in direct contact with the pipe shall be designed to allowable stresses listed in Tables 2 and A1.

Such materials shall not be used where temperatures exceed 650° F (345° C) and shall not be welded to the piping or piping component.

4.5 Allowable stresses for cast materials calculated in accordance with subsection 4.4 shall be reduced by a casting quality factor of 20%.

4.6 For steel materials not listed in Tables 2 and A1 of unknown specification, a stress value of 30% of yield strength (0.2% offset) at room temperature may be used. The yield strength shall be established by tensile testing a sample of material in accordance with ASTM A370. The value corresponding to a 0.2% permanent strain (offset) is the material yield strength. The stress value so established shall not exceed 9500 psi (65.5 MPA).

4.7 Load ratings for threaded hanger rods made from A36, A575 GR 1020 or A576 GR 1020 are shown in Table 3. Hanger rods made from all other materials shall also have a 25% reduction of the allowable stress. Load ratings shall be based on the thread root area. (The 25% reduction is to allow for normal installation and service conditions.)

4.8 Forged eye rods, and formed and welded eye rods shall have load capacities equal to those determined in accordance with Subsection 4.7 for the same nominal diameter. Formed but not welded eye rods shall have load capacities not greater than 35% of those determined in accordance with Subsection 4.7 for the same nominal diameter.

4.9 Capacities for U-bolts, loaded in tension, shall be limited to twice the capacity of hanger rods of the same material and diameter.

4.10 All threaded items, both external and internal, not covered by Subsections 4.7, 4.8 or 4.9 need not be subjected to the 25% stress reduction.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:22:32 2005

4.11 Design temperature of hanger components in direct contact with the pipe shall be the temperature of the contained fluid. For conventional high temperature piping installations, a reduction in temperature of 100°F/in. as measured from the outer pipe surfaces may be applied for strength calculations and material requirements. Alloy bolting within insulation may be furnished with ASTM A194 Grade 2H nuts for line temperatures to 1050°F (566°C).

GENERAL NOTES

1) Allowable stresses for these materials are based upon those of comparable materials of similar chemical properties.
2) "M" grade steels are acceptable for A575 listings in lieu of non "M" grade steels.
3) For temperatures above 1000° F, these stress values may be used only if the material is heat treated by heating it to a minimum temperature of 1900° F and quenching in water or rapidly cooling by other means.
4) At temperatures above 1000° F, these stress values apply only when the carbon is 0.04% or higher on heat analysis.
5) Class 1 only.
6) Age hardened at 1075° F.
7) For temperatures above 800° F, these stress values apply only when the carbon is 0.04% or higher.
8) For bolt diameters less than or equal to 1 inch.
9) For bolt diameters greater than 1 inch and less than or equal to 1-1/2 inch.
10) For diameters less than or equal to 2-1/2 inch.
11) For diameters greater than 2-1/2 inch and less than or equal to 4 inch.
12) For diameters greater than 4 inch.
13) For bolt diameters greater than 1-1/2 inch and less than or equal to 3 inch.
14) For material thickness less than 2 inch.
15) For material thickness 2 to 3 inch.

TABLE 3. LOAD RATINGS OF THREADED HANGER RODS MATERIALS—ASTM 36, A575 Gr 1020 or A576 Gr 1020

Nominal Rod Diameter		Root Area of Thread		Max. Safe Load At Rod Temp Of 650°F (343°C)	
Inch	mm	Sq. Inch	Sq. mm	Pounds	Kg
3/8	9.6	0.068	43.8	610	275
1/2	12.7	0.126	81.3	1130	515
5/8	15.8	0.202	130.3	1810	820
3/4	19.0	0.302	194.8	2710	1230
7/8	22.2	0.419	270.3	3770	1710
1	25.4	0.552	356.1	4960	2250
1 1/4	31.8	0.889	573.5	8000	3630
1 1/2	38.1	1.293	834.2	11630	5280
1 3/4	44.4	1.744	1125	15690	7120
2	50.8	2.292	1479	20690	9390
2 1/4	57.2	3.021	1949	27200	12350
2 1/2	63.5	3.716	2397	33500	15200
2 3/4	69.8	4.619	2980	41600	18890
3	76.2	5.621	3626	50600	22970
3 1/4	82.6	6.720	4435	60500	27460
3 1/2	88.9	7.918	5108	71260	32350
3 3/4	95.2	9.214	5945	82900	37640
4	101.6	10.608	6844	95500	43360
4 1/4	108.0	12.100	7806	108900	49440
4 1/2	114.3	13.690	8832	123200	55930
4 3/4	120.6	15.379	9922	138400	62830
5	127.0	17.165	11074	154500	70140

Notes:

1. Rods 3 inch (76.2mm) and larger shall be ASTM A36 or A576 gr 1020.
2. For load rating of threaded materials, other than ASTM A36, A575 Gr 1020, or A576 Gr 1020, see requirements of Subsection 4.5 and Tables 2 and A1.
3. Tabulated loads are based on an allowable tensile stress of 12,000 psi (82.7 MPa) reduced by 25% resulting in 9,000 psi (62 MPa). (12,000 psi allows for the interchangeability of the referenced rod materials.) (The 25% reduction is to allow for normal installation and service conditions.)

5. FABRICATION REQUIREMENTS FOR STEEL HANGERS

5.1 Cold Forming

5.1.1 Cold forming of plate and flat bars may be performed on materials 0.5 inch (12.7mm) thick or less to a minimum inside radius of one times the stock thickness. Cold forming may be performed on material over 0.5 inch (12.7mm) thick to a minimum inside radius of 2.5 times the stock thickness. Material over 0.5 inch (12.7mm) thick may be cold formed to an inside radius less than 2.5 times but not less than one times the stock thickness provided heat treatment is performed as prescribed in Subsection 5.3 and a case history is established showing that forming or a subsequent process does not have a damaging effect detrimental to the strength or function of the product.

5.1.2 Round bars 0.75 inch (19mm) diameter and smaller may be cold formed to a minimum inside radius of 1/2 times the bar diameter. Round bars greater than 0.75 inch (19mm) diameter may be cold formed to a minimum inside radius of 2-1/2 times bar diameter. Forming is not permitted on threaded areas.

5.1.3 Heating material to less than minimum temperature shown in 5.2.1, to facilitate the forming operation, shall be considered cold forming.

5.2 Hot Forming

5.2.1 Hot forming of plate and flat bars may be performed on materials of any thickness to an inside radius not less than one times the stock thickness within the following surface temperature ranges (no holding time required):

Carbon Steel	1400°F Min. (760°C)	2000°F Max. (1093°C)

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:22:33 2005

Chrome-Moly Alloy Steel	1550°F Min. (843°C)	2000°F Max. (1093°C)
Austenitic Stainless Steel	1400°F Min. (760°C)	2100°F Max. (1148°C)

Material shall not be heated in bundles or closed stacks in other than induction type furnaces but shall be separated to allow good circulation within the furnaces. Materials should not be heated above the maximum temperature shown. No hot forming operation shall be performed below the minimum temperature shown. Carbon steel and chrome-moly alloy steel shall be cooled in still air. Water quenching is not permitted. Cooling of stainless steel other than still air cooling, may be accomplished as per ASTM A403, Paragraph 6.

5.2.2 Round bars of any diameter may be hot formed to a minimum inside radius of 1/2 times the bar diameter within the temperature ranges given in Subsection 5.2.1. Forming is not permitted on threaded areas.

5.3 Heat Treatment After Forming

5.3.1 Stress relieving, when required of carbon steel and chrome-moly steel, shall be done within the temperature ranges shown below. The material is to be held at temperature for one hour per inch of thickness, but not less than one hour, followed by slow cooling in furnace. Carbon steel may be cooled in still air.

Carbon Steel	1100°F Min. (593°C)	1250°F Max. (676°C)
Chrome-Moly Alloy Steel	1300°F Min. (704°C)	1400°F Max. (760°C)

5.3.2 A carbide solution heat treatment of austenitic stainless steel, when required by design specification, shall be performed as prescribed by ASTM A403, Paragraph 6.

5.4 Incremental bending by braking is an acceptable method of forming.

5.5 Formed components may be furnished in "as formed" condition without any further mechanical work.

5.6 Welding

5.6.1 Unless otherwise specified by the job specification, welders and welding procedures shall be qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX. When qualifying a welding procedure for materials listed in Table 2, which do not have a P-number, use of the S-number and Group Number from ASME Section III, Code Case N-71-11 qualifies that material to corresponding P-Number and Group Number in Section IX. Welder's performance test results and Welding Procedure Qualification Records shall be available, upon request, to authorized inspection personnel.

5.6.2 When tack welds are to become a part of the finished weld, they shall be visually examined and ground or feathered, if necessary. Defective tack welds and tack welds made by unqualified welders shall be removed.

5.6.3 Attachments welded directly to the pipe shall be of appropriate chemical composition, compatible for welding and able to withstand the anticipated loads at the piping temperature. The method of attachment to the pipe shall meet all the preheating, welding and post weld heat treating requirements of the applicable piping code.

5.6.4 Prehating and post weld heat treating (PWHT) requirements for pipe hangers shall be as outlined in Tables 4 and A4.

5.6.5 Unacceptable welds shall be removed by flame or arc gouging, grinding, chipping, or machining. Welds requiring repair shall be welded in accordance with the requirements of the original weld. Base metal irregularities requiring repair by welding shall be repaired in accordance with the material specification or ASTM A6, as applicable. Welders and welding procedures used in making repair welds shall be qualified in accordance with Subsection 5.6.1.

5.7 Surface Discontinuities

5.7.1 Only those surface discontinuities that are detrimental to the strength or function of a product shall be cause for rejection.

5.7.2 Surface discontinuities of welds shall be evaluated in accordance with the applicable code or job specification requirements.

6. PROTECTIVE COATINGS FOR CORROSION, ABRASION AND ELECTROLYTIC RESISTANCE

6.1 Metallic Coatings

6.1.1 Metallic coatings for corrosion resistance may be applied by electroplating, pre-galvanizing, hot dip galvanizing, or mechanical plating.

TABLE 4. PREHEAT AND POST WELD HEAT TREATMENT (PWHT) REQUIREMENTS FOR PIPE HANGERS AND SUPPORTS

Material Designation	Base Material Size	Thickness of Weld (Equal Leg Fillet Weld)*	Other Requirements	Minimum Preheat Temperature	Post Weld Heat Treatment (See Note 4)
P-1 Carbon Steel	3/4″ & Less	All Weld Sizes	None	50°F	Not Required
	Over 3/4″ to 1″	1/16″ to 3/4″ (1/8″ to 1″ Fillet)	None	50°F	Not Required
		Over 3/4″ (Over 1″ Fillet)			1100°F - 1200°F (See Note 6)
	Over 1″	3/4″ & Less (1″ & Less Fillet)	.30% Carbon or Less	50°F	1100°F to 1200°F (See Note 6)
			Greater than .30% Carbon	175°F	
			Or as an Option None	200°F	Not Required
		Over 3/4″ (Over 1″ Fillet)	.30% Carbon or Less	50°F	1100°F to 1200°F (See Note 6)
			Greater than .30% Carbon	175°F	
P-4 Chrome/Moly Alloy Steel	1/2″ & Less	All Weld Sizes	60 KSI & Less	50°F	1300°F to 1375°F (See Note 6)
			Greater than 60 KSI	250°F	
	Over 1/2″	All Weld Sizes	None	250°F	
P-5 Chrome/Moly Alloy Steel	1/2″ & Less	All Weld Sizes	60 KSI & Less	300°F	1300°F - 1400°F (See Note 6)
			Greater than 60 KSI	400°F	
	Over 1/2″	All Weld Sizes	6% Cr. & Less and 60 KSI & Less	300°F	
	All	All Weld Sizes	Greater than 6% Cr.	400°F	
			Greater than 60 KSI All Percentages of Cr.	400°F	
P-8 Stainless Steel	All	All Weld Sizes	None	50°F	(See Note 7)

*Size of equivalent equal leg fillet weld shown for convenience. The weld thickness of all other types of welds need to be determined by an acceptable conventional method.

TABLE A4. PREHEAT AND POST WELD HEAT TREATMENT (PWHT) REQUIREMENTS FOR PIPE HANGERS AND SUPPORTS — METRIC UNITS

Material Designation	Base Material Size	Thickness of Weld (Equal Leg Fillet Weld)*	Other Requirements	Minimum Preheat Temperature	Post Weld Heat Treatment (See Note 4)
P-1 Carbon Steel	20mm & Less	All Weld Sizes	None	10°C	Not Required
	Over 20mm to 25mm	2mm to 20mm (3mm to 25mm Fillet)	None	10°C	Not Required
		Over 20mm (25mm Fillet)			593°C - 649°C (See Note 6)
	Over 25mm	20mm & Less (25mm & Less Fillet)	.30% Carbon or Less	10°C	593°C - 649°C (See Note 6)
			Greater than .30% Carbon	79°C	
			Or as an Option None	93°C	Not Required
		Over 20mm (Over 25mm Fillet)	.30% Carbon or Less	10°C	593°C - 649°C (See Note 6)
			Greater than .30% Carbon	79°C	
P-4 Chrome/Moly Alloy Steel	13mm & Less	All Weld Sizes	414 MPA & Less	10°C	704°C - 746°C (See Note 6)
			Greater than 414 MPA	121°C	
	Over 13mm	All Weld Sizes	None	121°C	
P-5 Chrome/Moly Alloy Steel	13mm & Less	All Weld Sizes	414 MPA & Less	149°C	704°C - 760°C (See Note 6)
			Greater than 414 MPA	204°C	
	Over 13mm	All Weld Sizes	6% Cr. & Less and 414 MPA & Less	149°C	
	All	All Weld Sizes	Greater than 6% Cr.	204°C	
			Greater than 414 MPA All Percentages of Cr.	204°C	
P-8 Stainless Steel	All	All Weld Sizes	None	10°C	(See Note 7)

*Size of equivalent equal leg fillet weld shown for convenience. The weld thickness of all other types of welds need to be determined by an acceptable conventional method.

TABLE 4 and TABLE A4 (Continued)

NOTES:

1. When joining carbon steel and alloy steel by welding, the higher preheat and PWHT temperatures of the two materials shall apply.

2. When joining stainless steel to either carbon steel or alloy steel, caution shall be exercised as the stainless steel material may not be suited for the preheat or PWHT temperatures required by the other materials.

3. When carbide solution heat treatment of stainless steel is required by the design specification, heat treatment shall be in accordance with ASTM A403, Paragraph 6.

4. PWHT Requirements:

   a) PWHT may be by full furnace heat treatment or by local heating. When local heating is used, the width of the heated band shall be at least three (3) times the thickness of the thickest section at the joint.

   b) For Table 4 — Above 600° F the rate of heating and cooling shall not exceed 600° F per hour divided by one-half (1/2) the maximum thickness of material in inches at the weld, but in no case shall the rate exceed 600° F per hour.

   c) For Table A4 — Above 315° C the approximate rate of heating and cooling shall not exceed 315° C per hour divided by .021 times the maximum thickness of material in mm at the weld, but in no case shall the rate exceed 315° C per hour.

5. Base material size refers to the thickness at the weld of the thicker part being joined.

6. Hold Time Requirements:

   a) For Table 4 — Hold time shall be one (1) hr./in. up to 2″ thick with fifteen (15) minutes maximum. For 2″ and over; two (2) hours plus fifteen (15) minutes for each inch over 2″.

   b) For Table A4 — Hold time shall be one (1) hour/25.4mm up to 50.8mm thick with fifteen (15) minutes minimum. For 50.8mm and over; two (2) hours plus fifteen (15) minutes for each 25.4mm over 50.8mm.

7. Post weld heat treatment of stainless steel is neither required nor prohibited (Notes 2 and 3).

8. Information contained in this table, which covers materials commonly used in the manufacture of pipe hangers and supports, has been consolidated from ANSI/ASME B31.1-1986 edition.

6.1.2 Electroplating shall be in accordance with ASTM B633 or B766 for the specific coating used. To avoid difficulty in assembling threaded parts that are plated, female machine threads may be tapped oversize. It is not permissible to rethread male parts after plating. It is acceptable for female threads to be uncoated.

6.1.3 Pre-galvanized sheet shall meet the requirements of ASTM A525.

6.1.4 Hot dip galvanizing shall be done in accordance with ASTM A153 or A123. To avoid difficulty in assembling threaded parts, it is recommended that male parts be shaken, spun, or hand brushed to remove spelter lumps from the threads. It is recommended that female machine threads be tapped oversize to accommodate the male thread. It is acceptable for female threads to be uncoated.

6.1.5 Mechanical plating shall be done in accordance with ASTM B695 and B696.

6.1.6 Repair of metallic protective coatings may be performed in accordance with coating manufacturer's recommendations.

6.2 Non-Metallic Coatings

6.2.1 Non-metallic coatings shall be the types selected for specific purposes. Application of coatings shall be in accordance with the coating manufacturer's recommendations. In general, only such coatings with good adhesive quality that will withstand reasonably rough handling should be used.

6.2.2 Non-metallic coatings that are suitable for threaded products may be applied before assembly.

6.2.3 Non-metallic coatings, jackets and liners to prevent abrasion of glass or plastic pipe, etc., shall be applied in accordance with manufacturer's recommendations.

6.2.4 Non-metallic coatings, jackets and liners for electrolytic resistance shall have dielectric strength suitable for the intended use.

6.3 Superficial copper plating or other superficial coatings are not intended to provide corrosion protection and are applied for identification purposes only.

7. DIMENSIONS

7.1 Unprotected flat steel bands shall have a minimum thickness of 0.12 inch (3.2mm) and a minimum width of 1 inch (25.4mm). As an exception for pipe NPS 1 (DN25) and smaller, the minimum cross section shall be 0.06 inch (1.6mm) x 0.75 inch (19.1mm). Equivalent cross sections may be substituted provided the minimum thickness is not decreased.

7.2 Hanger Types 5, 7, 9 and 10 that meet with tabulated load requirements of Table 1 and that have protective coatings in accordance with Section 6 need not conform to minimum dimensional requirements of Subsection 7.1.

7.3 Hanger rods shall be a minimum of 0.37 inch (9.6mm) diameter and shall be limited to pipe or tubing NPS 2 (DN50) and less. For pipe and tubing NPS 2.5 (DN65) and greater, the rod diameter shall be not less than 0.5 inch (12.7mm). In addition, the minimum rod diameter for rigid hangers must be sized for the loads shown in Table 1.

7.4 Hanger rods utilizing rolled threads must be threaded full length.

7.5 Eye rods shall have a minimum inside diameter of eye 0.12 inch (3.2mm) larger than the rod size.

7.5.1 Forged eye rods shall have a metal area across the eye equal to or greater than 1.25 times the area of the rod.

7.5.2 Formed and welded eye rods shall have a circumferential length of weld not less than twice the rod diameter.

8. THREADS

8.1 Screw threads shall be in conformance with ANSI B1.1 or National Institute of Standards Technology Handbook H-28, UNC 2A/2B for the coarse thread series and 8UN 2A/2B for the eight thread series.

8.2 Pipe threaded for adjustment means, shall be in accordance with ANSI/ASME B1.20-1 NPSM and NPSL for Standard Straight Pipe Threads.

8.3 Special thread forms and fits other than specified by Subsection 8.1 and 8.2 shall be used only when both male and female members are furnished as part of a permanent assembly or in cases listed in Section 6.

9. PROTECTION SADDLES AND SHIELDS

9.1 Pipe covering protection saddles (Type 39) shall be made of material as follows: For pipe NPS 5

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:22:35 2005

(DN125) and smaller, the minimum metal thickness shall be 0.12 inch (3.2mm); for pipe NPS 6 (DN150) and larger, the minimum metal thickness shall be 0.19 inch (4.8mm). Saddles shall have sufficient depth for the insulation thickness required and the ribs shall be notched so that rib contact with pipe is between 25% and 50% of each rib length. All standard saddles shall be 12 inch (305mm) in axial length and shall span an arc of approximately 60°. Saddles for pipe NPS 12 (DN300) and larger shall have a center rib. Standard saddles shall accommodate nominal insulation thicknesses 1″, 1-1/2″, 2″, 2-1/2″, 3″, 4″ and 5-1/2″ (25mm, 38mm, 51mm, 64mm, 76mm, 102mm and 140mm).

9.2 Pipe coverings protection shields (Type 40) can be used with or without high compressive strength inserts.

9.2.1 When used without high compressive strength inserts, pipe covering protection shields shall be in accordance with Table 5, and shall span an arc of 180°.

9.2.2 When pipe covering protection shields are used with high compressive strength inserts, the shield length and thickness shall be appropriate for the compressive strength of the insert material. The insert shall be at least as long as the shield and where a vapor barrier is required, the vapor barrier shall extend 2 inches (51mm) beyond the shield and overlap the outside circumference by 2 inches (51mm).

9.2.3 It is recommended that provision be made to hold shields in place.

TABLE 5. DIMENSIONS FOR PIPE COVERING PROTECTION SHIELDS—TYPE 40

Nom. Pipe or Tub. Size		Length		Thickness	
Inches	mm	Inches	Millimeters	Gage	Inches
¼-3½	7-90	12	305	18	.048
4	100	12	305	16	.060
5 & 6	125 & 150	18	457	16	.060
8-14	200-350	24	610	14	.075
16-24	400-600	24	610	12	.105

Table 5 is based on 15 psi (103 kPa) compressive strength insulation. For compressive strengths other than 15 psi (103 kPa) dimensions may be adjusted accordingly.

10. SPRING SUPPORTS AND SWAY BRACES

10.1 Spring supports are divided into three classes; Spring Cushion, Variable Support, and Constant Support.

10.1.1 Spring Cushion Supports (Types 48 and 49). This class is limited to those using springs having a 2 inch (51mm) or less total deflection and which are not provided with load or travel indicators. Springs shall be confined so that accidental release of load is impossible. Travel limit stops need not be provided.

10.1.2 Variable Supports (Types 51, 52 and 53). This class applies to all variable effort type spring supports. Supports in this class shall have load and travel scales with provisions for marking "hot" and "cold" settings. Limit stops shall be provided to prevent excessive travel from overstressing the spring or release of load. A properly designed confined compression spring will serve as such a stop. Where stops for hydrostatic test purposes are provided, the unit shall be capable of supporting up to 2 times the normal operating load. Spring supports for this class shall have characteristics so that use at the maximum recommended pipe travel results in a variability factor of not more than 25%. (See Equation 1.)

Equation 1:

$$\text{Variability Factor} = \frac{\text{Pipe travel in (mm) x spring rate lbs/in (Kg/mm)}}{\text{Operating load lbs (Kg)}}$$

10.1.3 Constant Supports (Types 54, 55 and 56). This class applies to all constant effort type spring supports where the variable spring force is compensated either mechanically or by auxiliary springs to result in a mean variability (deviation from specified load)[1], including friction, of not more than 6% throughout total travel range. These supports shall be provided with a travel scale, a load adjustment scale, provisions for field load adjustment of at least ± 10%, provisions for "hot" and "cold" settings, limit stops to prevent over travel or release of load, and

(1) Deviation from specified load is the sum of kinematic friction and manufacturing tolerance factor. Determination of deviation is by load test machine and is calculated as in Equation 2.

Equation 2:

$$\text{Deviation from Specified Load} = \frac{\text{Max. reading moving down - Min. reading moving up}}{\text{Max. reading moving down + Min. reading moving up}}$$

Maximum reading moving down and minimum reading moving up shall be within 6% of specified load.

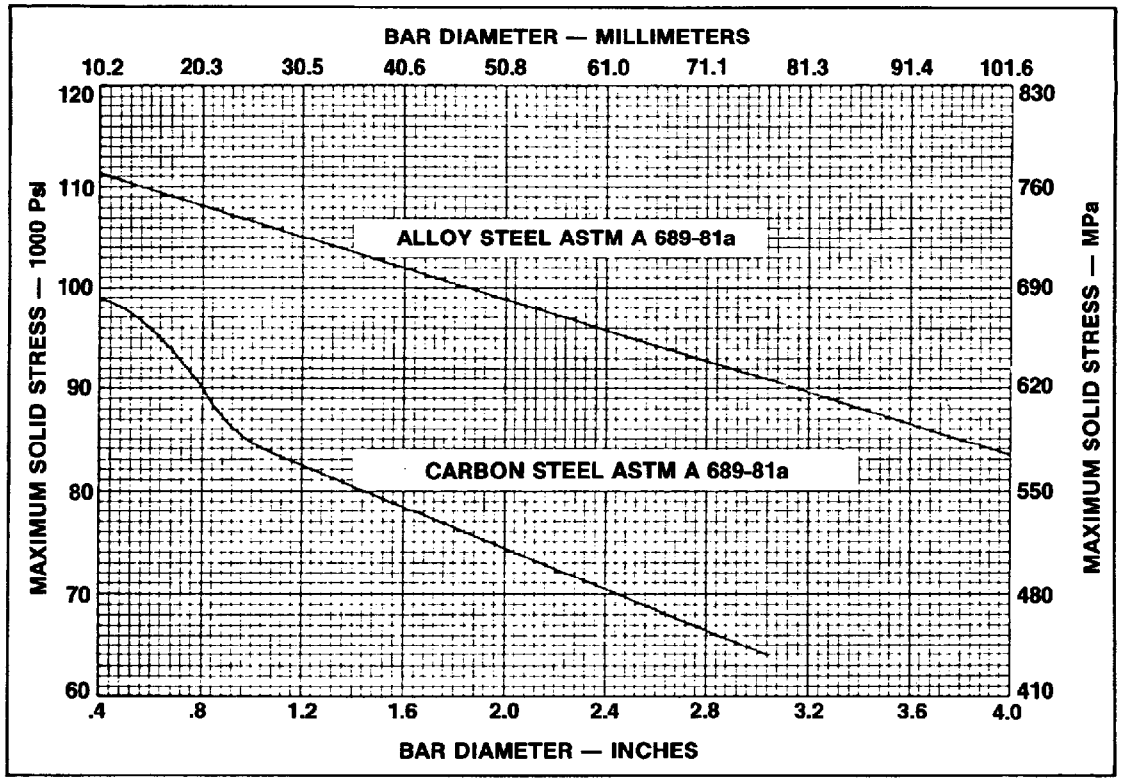

FIGURE 2. SOLID DESIGN STRESS (UNCORRECTED) FOR HOT WOUND COMPRESSION SPRINGS

auxiliary stops (where required) for erection and hydrostatic test purposes. The unit shall be capable of supporting up to 2 times the normal operating load. All constant supports shall be calibrated by the manufacturer. Special consideration shall be given to the possible effects of calibrating the unit in other than the intended installed position. The user is advised to specify a unit with sufficient total travel to provide adequate travel reserve.

10.2 Spring Sway Brace (Type 50). This class includes spring devices designed to control undesirable pipe movement and also provide forces to restore pipe to normal operating position. They shall consist of one or more springs, suitably confined, and may be either single or double acting.

11. SPRING DESIGN

11.1 Structural components of all classes of spring supports and sway braces noted in Section 10 shall be designed as specified elsewhere in this standard except that springs shall be designed as stated in 11.2 through 11.5.

11.2 Springs for pipe supports are generally of the helical coil type. Compression springs, unless suitably guided, shall have a free length to coil diameter (O.D.) ratio not greater than 4:1. Special forms of springs such as leaf, disc, volute, involute, torsion, and the like may be used. Such forms, when used, are to be designed and manufactured in accordance with acceptable commercial practices.

11.3 Helical Hot Wound Springs

11.3.1 Springs shall be designed so that maximum uncorrected solid stress[1] for compression springs shall not exceed those shown on the chart, Figure 2, by more than 10%. Working stresses (uncorrected) for compression springs shall be limited to 80% of the chart values. For extension springs the solid stress (uncorrected) shall be limited to 90% of chart values and working stress (uncorrected) shall be limited to 70% of the chart values.

11.3.2 Springs shall be manufactured in accordance with ASTM A125.

11.3.3 Alloy Springs of 1.5 inch (38.1mm) and larger bar diameter shall be inspected after heat

[1] Maximum uncorrected solid stress is a calculated stress without correction for curvature.

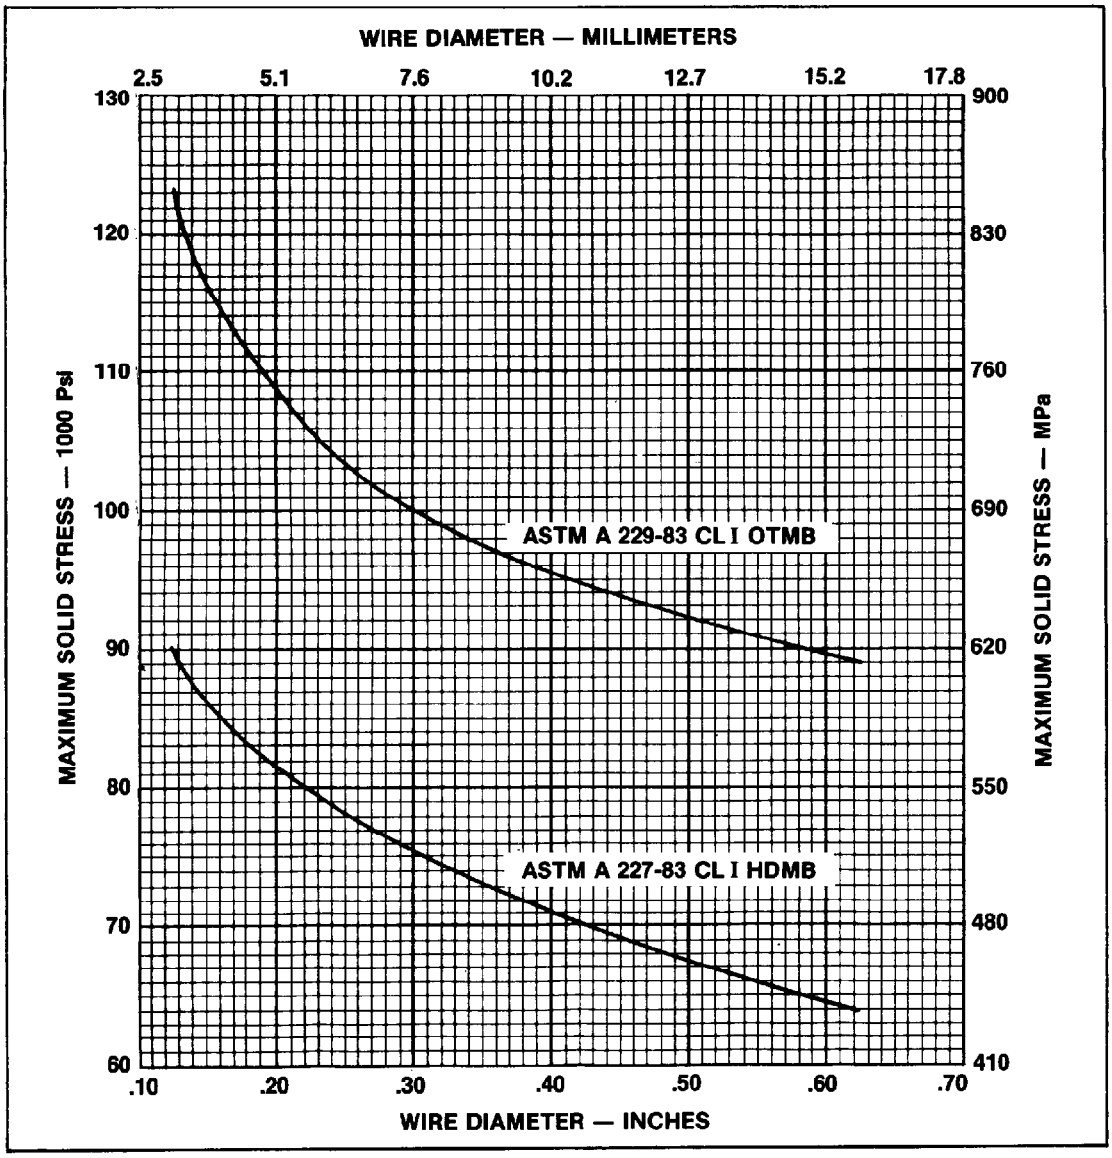

FIGURE 3. SOLID DESIGN STRESS (UNCORRECTED) FOR COLD WOUND COMPRESSION SPRINGS

treatment by the magnetic particle or equivalent method. Springs with seams, slits, or quench cracks deeper than 3% of bar diameter shall be rejected. The depth of discontinuity may be determined by grinding and blending, and measuring the minimum diameter of the remaining bar.

11.4 Helical Cold Wound Springs

11.4.1 Compression springs shall be designed so that the maximum uncorrected solid stress shall not exceed those shown on the chart, Figure 3. Working stresses (uncorrected) for compression springs shall be limited to 80% of chart values. For extension springs both solid stress and working stress shall be reduced 10% from that allowed for compression springs.

11.4.2 Springs shall be manufactured in accordance with Spring Manufacturers Institute, Inc., Standard for Compression, Extension, Torsion and Flat Springs.

11.5 Springs may be electroplated for corrosion protection provided proper procedures to avoid embrittlement are observed in accordance with ASTM B242. Maximum allowable working stress shall be reduced 15% for electroplated springs. Non-

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc

metallic coatings shall be applied for corrosion protection wherever possible to avoid inherent electroplating difficulties.

12. RESTRAINT CONTROL DEVICES (TYPE 47)

12.1 Hydraulic devices for the control of vibration or shock may be piston or rotating vane type and shall be designed in accordance with proven commercial practice. It is recommended that a non-flammable fluid be used. These devices can accommodate thermal movement.

12.2 Mechanical devices for the control of vibration and shock shall be designed in accordance with the requirements of Section 4. Materials shall be suitable for the intended service and ambient conditions. These devices can accommodate thermal movement.

12.3 Rigid struts or sway braces used for the control of vibration and shock shall be designed in accordance with the requirements of Section 4. Materials shall be suitable for the intended service and ambient conditions. These devices cannot accommodate thermal movement in the primary direction (Tension or compression).

13. MARKING

13.1 On cast hangers or supports, the name, initial or other identifying mark may be legibly cast on each piece. On fabricated hangers and supports, the name or mark may be die stamped on a main member. This marking may be omitted if it cannot be incorporated into the regular production process without additional operational steps, and should be omitted where it may impair the strength.

13.2 Hanger components specifically sized for use on copper tubing or copper pipe are normally identified by the manufacturer by a color system; this may not be intended to provide corrosion protection. The user should consult with the manufacturer when corrosion protection is required. (See Subsection 6.3)

14. INSPECTION

Units shall be inspected in accordance with the established quality control procedures of the manufacturer.

15. TESTING

Any physical or non-destructive testing of units or parts thereof, beyond that required for normal production control, shall be the responsibility of the purchaser.

GENERAL NOTES

1) Allowable stresses for these materials are based upon those of comparable materials of similar chemical properties.
2) "M" grade steels are acceptable for A575 listings in lieu of non "M" grade steels.
3) For temperatures above 538°C, these stress values may be used only if the material is heat treated by heating it to a minimum temperature of 1038°C and quenching in water or rapidly cooling by other means.
4) At temperatures above 538°C, these stress values apply only when the carbon is 0.04% or higher on heat analysis.
5) Class 1 only.
6) Age hardened at 579°C.
7) For temperatures above 427°C, these stress values apply only when the carbon is 0.04% or higher.
8) For bolt diameters less than or equal to 25.4mm.
9) For bolt diameters greater than 25.4mm and less than or equal to 38.1mm.
10) For diameters less than or equal to 63.5mm.
11) For diameters greater than 63.5mm and less than or equal to 101.6mm.
12) For diameters greater than 101.6mm.
13) For bolt diameters greater than 38.1mm and less than or equal to 76.2mm.
14) For material thicknesses less than 50.8mm.
15) For material thicknesses 50.8 to 76.2mm.

LIST OF MSS STANDARD PRACTICES

NUMBER	
SP- 6-1990	Standard Finishes for Contact Faces of Pipe Flanges and Connecting-End Flanges of Valves and Fittings
SP- 9-1992	Spot Facing for Bronze, Iron and Steel Flanges
SP-25-1993	Standard Marking System for Valves, Fittings, Flanges and Unions
SP-42-1990	Class 150 Corrosion Resistant Gate, Globe, Angle and Check Valves with Flanged and Butt Weld Ends
SP-43-1991	Wrought Stainless Steel Butt-Welding Fittings
SP-44-1991	Steel Pipe Line Flanges
SP-45-1992	Bypass and Drain Connections
SP-51-1991	Class 150 LW Corrosion Resistant Cast Flanges and Flanged Fittings
SP-53-1985 (R 1990)	Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components — Magnetic Particle Examination Method
SP-54-1985 (R 1990)	Quality Standard for Steel Castings for Valves, Flanges and Fittings and Other Piping Components — Radiographic Examination Method
SP-55-1985 (R 1990)	Quality Standard for Steel Castings for Valves, Flanges and Fittings and Other Piping Components — Visual Method
SP-58-1993	Pipe Hangers and Supports — Materials, Design and Manufacture
SP-60-1991	Connecting Flange Joint Between Tapping Sleeves and Tapping Valves
SP-61-1992	Pressure Testing of Steel Valves
SP-65-1990	High Pressure Chemical Industry Flanges and Threaded Stubs for Use with Lens Gaskets
SP-67-1990	Butterfly Valves
SP-68-1988	High Pressure-Offset Seat Butterfly Valves
SP-69-1991	Pipe Hangers and Supports — Selection and Application
SP-70-1990	Cast Iron Gate Valves, Flanged and Threaded Ends
SP-71-1990	Cast Iron Swing Check Valves, Flanged and Threaded Ends
SP-72-1992	Ball Valves with Flanged or Butt-Welding Ends for General Service
SP-73-1991	Brazing Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings
SP-75-1993	Specifications for High Test Wrought Butt Welding Fittings
SP-77-1984 (R 1990)	Guidelines for Pipe Support Contractual Relationships
SP-78-1987 (R 1992)	Cast Iron Plug Valves, Flanged and Threaded Ends
SP-79-1992	Socket-Welding Reducer Inserts
SP-80-1987	Bronze Gate, Globe, Angle and Check Valves
SP-81-1981 (R 1986, 91)	Stainless Steel, Bonnetless, Flanged Knife Gate Valves
SP-82-1992	Valve Pressure Testing Methods
SP-83-1987	Steel Pipe Unions, Socket-Welding and Threaded
SP-84-1990	Valves — Socket-Welding and Threaded Ends
SP-85-1985	Cast Iron Globe & Angle Valves, Flanged and Threaded Ends
SP-86-1987 (R 1992)	Guidelines for Metric Data in Standards for Valves, Flanges, Fittings and Actuators
SP-87-1991	Factory-Made Butt-Welding Fittings for Class I Nuclear Piping Applications
SP-88-1993	Diaphragm Type Valves
SP-89-1991	Pipe Hangers and Supports — Fabrication and Installation Practices
SP-90-1986 (R 1991)	Guidelines on Terminology for Pipe Hangers and Supports
SP-91-1992	Guidelines for Manual Operation of Valves
SP-92-1987 (R 1992)	MSS Valve User Guide
SP-93-1987 (R 1992)	Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components — Liquid Penetrant Examination Method
SP-94-1992	Quality Standard for Ferritic and Martensitic Steel Castings for Valves, Flanges, and Fittings and Other Piping Components — Ultrasonic Examination Method
SP-95-1986 (R 1991)	Swage(d) Nipples and Bull Plugs
SP-96-1991	Guidelines on Terminology for Valves and Fittings
SP-97-1987	Forged Carbon Steel Branch Outlet Fittings — Socket Welding, Threaded and Buttwelding Ends
SP-98-1992	Protective Epoxy Coatings for the Interior of Valves and Hydrants
SP-99-1989	Instrument Valves
SP-100-1988	Qualification Requirements for Elastomer Diaphragms for Nuclear Service Diaphragm Type Valves
SP-101-1989	Part-Turn Valve Actuator Attachment — Flange and Driving Component Dimensions and Performance Characteristics
SP-102-1989	Multi-Turn Valve Actuator Attachment — Flange and Driving Component Dimensions and Performance Characteristics
SP-103-1990	Wrought Copper and Copper Alloy Insert Fittings for Polybutylene Systems
SP-104-1990	Wrought Copper LW Solder Joint Pressure Fittings
SP-105-1990	Instrument Valves for Code Applications
SP-106-1990	Cast Copper Alloy Flanges and Flanged Fittings, Class 125, 150 and 300
SP-107-1991	Transition Union Fittings for Joining Metal and Plastic Products
SP-108-1991	Resilient Seated-Eccentric Cast Iron Plug Valves
SP-109-1991	Welded Fabricated Copper Sodder Joint Pressure Fittings
SP-110-1992	Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
SP-111-1992	Gray-Iron and Ductile-Iron Tapping Sleeves
SP-112-1993	Quality Standard for Evaluation of Cast Surface Finishes — Visual and Tactile Method. This SP must be sold with a 10-surface, three-dimensional Cast Surface Comparator, which is a necessary part of the Standard. Additional comparators may be sold separately.

R-Year — Indicates year standard reaffirmed without substantive change.

Prices available upon request.

A large number of former MSS Practices have been approved by the ANSI as ANSI Standards, published by others. In order to maintain a single source of authoritative information, the MSS withdraws its Standard Practices in such cases.

Edition

PIPE HANGERS AND SUPPORTS — SELECTION AND APPLICATION

Developed and Approved
by the
Manufacturers Standardization Society
of the
Valve and Fittings Industry, Inc.
127 Park Street, N.E.
Vienna, Virginia 22180
(703) 281-6613

Originally Approved July 1966

A Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacturer, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

FOREWORD

This standard was developed by a cooperative effort of representatives of the pipe hanger manufacturers. It is based on the best practice current at this time and on the collective experience of the industry. There are two companion standards, MSS SP-58 and MSS SP-89, relating to hanger materials, design, manufacture, fabrication and installation. In addition, the MSS Hanger Committee has developed guidelines for pipe supports contractural relationships and on hanger terminology as covered in MSS SP-77 and MSS-90 respectively.

U.S. customary units in this SP are the standard; the metric units are for reference only.

This document has been substantively revised from the previous 1991 edition. It is suggested that if the user is interested in knowing what changes have been made, that direct page by page comparison should be made of this document.

Other standards documents referred to herein are identified by the date of issue that was applicable to this standard at the date of issue of this standard. See Annex A. This standard shall remain silent on the applicability of those other standards of prior or subsequent dates of issue even though provisions of concern may not have changed.

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-69, 1996, with permission of the publisher, the Manufacturers Standardization Society.' PIPE HANGERS AND SUPPORTS — SELECTION AND APPLICATION

1. SCOPE

1.1 This standard presents the recommended practice for the selection and application of pipe hangers and supports for all service temperatures.

2. OBJECTIVE

2.1 To serve as a pipe hanger and support specification for selection and application, by being referenced in whole or in part.

2.2 To serve as a guide to proven industry practice during engineering design and writing of job specifications covering the hanging, supporting and controlling the movement of piping systems.

2.3 To provide the erector with information on types of hanger and support components to be used for specific application and installations, where such information is not otherwise provided.

2.4 To serve as a companion document to MSS SP-58 which provides recommendations for material, design and manufacture of standard types of pipe hanger components.

2.5 To serve as a companion document to MSS SP-89 which provides recommendations for fabrication and installation of pipe hangers and supports.

3. CLASSIFICATION OF PIPING SYSTEMS

For the purpose of pipe hanger and support selection, this document establishes an identification of piping systems according to the operating (service) temperatures of the piping contents as follows:

3.1 Hot Systems

A-1. 120°F (49°C) to 450°F (232°C)
A-2. 451°F (233°C) to 750°F (399°C)
A-3. Over 750°F (399°C)

3.2 Ambient Systems

B. 60°F (16°C) to 119°F (48°C)

3.3 Cold Systems

C-1. 33°F (1°C) to 59°F (15°C)
C-2. -19°F (-28°C) to 32°F (0°C)
C-3. -39°F (-39°C) to -20°F (-29°C)
C-4. -40°F (-40°C) and below (Cryogenic Range)

4. GENERAL REQUIREMENTS

4.1 Where applicable, selection and application of pipe hangers and supports may be required to conform to Codes and Standards, such as:

a) ANSI/ASME B31 Codes for Pressure Piping
b) ASME Boiler and Pressure Vessel Codes
c) UL 203 Standard for Pipe Hanger Equipment for Fire Protection Service
d) Factory Mutual FM1951 Approval Standard for Pipe Hanger Components for Automatic Sprinkler Systems
e) NFPA 13
f) National and Local Building Codes
g) All Other Applicable Codes

4.2 The selection of pipe hangers and supports shall be based upon the overall design concept of the piping systems and any special requirements which may be called for in the specifications. The supporting systems shall provide for, and control, the free or intended movement of the piping including its movement in relation to that of connected equipment.

4.3 A careful study shall be made of the piping layout in relation to the surrounding structure and adjacent piping and equipment before selecting the type of support to be used at each hanger point.

4.4 Hangers, supports, anchors and restraints shall be selected to withstand all static and specified dynamic conditions of loading to which the piping and associated equipment may be subjected.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:23:06 2005

4.5 When pipe hanger load and movement calculations are required by the design specification, the following must be considered:

a) Deadweight Loads
b) Hydrostatic Loads
c) Thermal Loads
d) Loading Due to Expansion Joint Reaction Forces

4.6 When occasional pipe hanger load calculations are required, they must be clearly defined in the design specification. Types of occasional loads are:

a) Safety Valve Thrust Loads
b) Seismic Loads
c) Wind, Snow or Ice Loads
d) Turbine Trip-out Loads
e) Water Hammer Loads

4.7 Allowable stress levels listed in MSS SP-58 shall be used in the design of hanger assemblies with the following exceptions:

a) The load capacities for threaded hanger rods shall conform to Table 3 of MSS SP-58.

b) A 20% increase in allowable stress may be permitted for short time overloading conditions during operation.

c) For steels of known physical properties, an increase to 80% of minimum yield strength, at room temperature, during hydrostatic testing, is permissible. For steels of unknown physical properties, an increase to 80% of yield strength, as determined by physical test, is permissible, provided that the maximum allowable stress does not exceed 16,000 PSI (110MPa).

d) Loading combination considerations and allowable stress levels to be applied shall be established by the architect-engineer.

4.8 Hanger and support components shall be selected from Table 1 within the system classification.

4.9 Where additional structural framing members are required, they shall be designed for the specific loads they are to support in accordance with the AISC Specification for the Design, Fabrication and Erection of Structural Steel for Buildings. No increase in allowable stress is permitted for hydrostatic test periods.

4.10 Hangers for the suspension of size 2½ and larger pipe and tubing shall be capable of vertical hanger component adjustment under load.

4.11 Building structure shall be adequate for supporting pipe hanger loads as generated in 4.5 and 4.6, including hydrostatic test loads.

4.12 Installed hangers or hanger components shall be used only for their purpose. They shall not be used for rigging and erection purposes.

5. MATERIAL REQUIREMENTS

5.1 The materials of all pipe hanging and supporting elements shall be in accordance with MSS SP-58.

5.2 The material in contact with the pipe shall be compatible with the piping material so that neither shall have a deteriorating action on the other.

5.3 Materials subject to corrosion or electrolysis shall be protected as specified by the engineering design and such protection shall be applied in accordance with the requirements of MSS SP-58.

6. DIMENSIONAL REQUIREMENTS

6.1 Hangers and supports shall be sized to fit the outside diameter of pipe, tubing, or, if specified, the outside diameter of insulation. Manufacturers' catalog hangers provide a nominal clearance over standard tolerance piping and tubing. Consideration for fit should be given by the user for large diameter and/or out of tolerance piping and tubing.

6.2 Dimensional tolerances shall be in accordance with Section 4 of MSS SP-89.

7. SELECTION OF HANGERS AND SUPPORTS FOR PIPE MOVEMENT

7.1 The selection of hangers and supports shall be made to provide the piping system with the degree of control that its operating characteristics require.

7.2 Where negligible movement of pipe occurs at hanger locations, and no harmful loading on connecting equipment, piping, or structure would result, rod hangers may be used for suspended lines. For piping supported from below, bases, brackets or structural cross members may be used.

TABLE 1. HANGER & SUPPORT SELECTIONS

(For Spring Hangers, See Table 2)

To find recommended hanger or support components,

1. Locate the system temperature and insulation condition in the two columns at left.
2. Read across the column headings for the type of component to be used.
3. Numbers in boxes refer to those types shown in Figure 1, which corresponds to figure 1 of MSS-SP58.

NOTES:

1. Hangers on insulated systems shall incorporate protection saddles or shields or shall be clamped or welded to the pipe and project through the insulation to provide external attachment. (See section 10)
2. The selection of type and material shall be made by the Design Engineer.
3. The design shall be in accordance with MSS SP-58 or as specified by the Design Engineer.
4. For shields used with rollers or subject to point loading, see Table 5.
5. Continuous inserts, embedded plates, anchor bolts and concrete fasteners may be used as specified by the Design Engineer.

7.3 Where there is horizontal movement at a suspended type hanger location, hanger components shall be selected to allow for swing. Where horizontal piping displacement exceeds 1 inch, it is common practice to offset the pipe attachment or structural attachment by the amount of anticipated displacement or a percentage thereof. If the vertical angle of the hanger rod is greater than 4 degrees, a traveling device should be provided for horizontal movement. In special cases, vertical angles greater than 4 degrees may be used provided the resulting horizontal force and vertical deflection are considered in the piping and support design. For piping supported from below, slides, rollers, or roller carriages should be used.

7.4 Where significant vertical movement of the pipe occurs at the hanger location, a resilient support must be used. Selection of resilient supports shall be based on permissible load variation and effects on adjacent equipment. Support selection for typical load variations are shown in Table 2. Load and movement calculations shall be made for the proper selection of spring hangers. Vertical movement and load transfer from riser expansion to horizontal runs shall be given consideration when applying spring hangers.

TABLE 2. SPRING SUPPORT SELECTION

VERTICAL EXPANSION	ALLOWABLE VARIABILITY OR DEVIATION	SINGLE ROD HANGER	DOUBLE ROD HANGER	BASE SUPPORT
	NOTE (1)	NOTE (2) AND NOTE (3)		
MAX. 1/4 INCH (6.3mm)	25% 6%	48,51SS 51SS	48,49,51SS,53SS 51S, 53S	52SS 52S
MAX. 1 INCH (25.4mm)	25% 6%	51S 54,55	51S, 53S 54,55,56	52S 54,55
MAX. 3 INCH (76.2mm)	25% 6%	51LS 54,55	51LS,53LS 54,55,56	52LS 54,55
OVER 3 INCH (76.2mm)	25% 6%	54,55 54,55	54,55,56 54,55,56	54,55 54,55

NOTE (1) VARIABLE SPRING HANGERS

$$\text{VARIABILITY FACTOR} = \frac{\text{Pipe Travel in. (mm) X Spring Rate lbs/in. (Kg/mm)}}{\text{Operating Load LBS (Kg)}}$$

CONSTANT SUPPORT HANGERS

$$\text{DEVIATION FROM SPECIFIED LOAD} = \frac{\text{Max Reading Moving Down - Min Reading Moving Up}}{\text{Max Reading Moving Down + Min Reading Moving Up}}$$

Max. Reading Moving Down and Min. Reading Moving Up shall be within 6% of specified load.

(2) – NUMBERS IN COLUMNS ARE TYPE NUMBERS FROM FIGURE 1.

(3) – VARIABLE SPRING TYPES 51, 52, AND 53, i.e., STANDARD SPRING, SHORT SPRING AND LONG SPRING MODELS ARE IDENTIFIED AS S, SS, AND LS, RESPECTIVELY.

7.4.1 Spring Cushion Hangers may be used where vertical movement does not exceed ¼ inch (6.3 mm), and where formal load and movement calculations are not required.

7.4.2 Variable Spring Hangers shall be used for all other resilient support requirements except as noted in Subsection 7.4.3.

7.4.3 Constant Support Hangers shall be used on piping systems where the deviation in supporting force must be limited to 6 percent and which cannot be accommodated by a Variable Spring Hanger.

8. ATTACHMENTS MADE BY WELDING OR BOLTING

8.1 All attachments welded to the pipe shall be in accordance with MSS SP-58 and Pipe Fabrication Institute, Standard ES-26.

8.2 Welding or bolting or attachments to the building structural steel shall be in accordance with the AISC Specification for the Design, Fabrication and Erection of Structural Steel for Buildings. There shall be no drilling, punching or burning of holes in the building structural steel without prior approval by the design engineers.

8.3 For attachment to concrete structure, poured in place anchor bolts or inserts are preferred whenever possible. When necessary, approved concrete fasteners may be used.

8.4 Recommended applied torque for set screws in C-clamps (Types 19 and 23) is listed below:

Thread size Inch	(mm)	Torque Inch Pound	(Nm)
1/4	6.4	40	4.5
3/8	9.6	60	6.8
1/2	12.7	125	14.1
5/8	15.8	250	28.2
3/4	19.0	400	45.2
7/8	22.2	665	75.1

Note: Caution should be taken not to overtighten the set screw.

FOR PIPE SIZES SIX (6) INCHES (150mm) AND UNDER, INSTALLED ON ANSI B31 PROJECTS, THAT ARE SUBJECTED TO LOADINGS OTHER THAN WEIGHT OF PIPE AND CONTENTS, THE SPAN SHOULD BE LIMITED TO THE MAXIMUM SPACING FOR WATER SERVICE STEEL PIPE.	10 ft (3.0m) MAX SPACING; MIN OF ONE (1) HANGER PER PIPE SECTION CLOSE TO JOINT ON THE BARREL. ALSO AT CHANGE OF DIRECTION AND BRANCH CONNECTIONS.	8 ft (2.4m) MAX SPACING, FOLLOW MANUFACTURER'S RECOMMENDATIONS. SEE SECTION 17.	FOLLOW PIPE MANUFACTURER'S RECOMMENDATIONS FOR MATERIAL AND SERVICE CONDITION. SEE SECTION 18.	FOLLOW PIPE MANUFACTURER'S RECOMMENDATIONS FOR MATERIAL AND SERVICE CONDITION. SEE SECTION 19.

NOTE: (1) FOR SPACING SUPPORTS INCORPORATING TYPE 40 SHIELDS, SEE TABLE 5.
(2) DOES NOT APPLY WHERE SPAN CALCULATIONS ARE MADE OR WHERE THERE ARE CONCENTRATED LOADS BETWEEN SUPPORTS SUCH AS FLANGES, VALVES, SPECIALTIES, ETC., OR CHANGES IN DIRECTION REQUIRING ADDITIONAL SUPPORTS.
(3) UNBALANCED FORCES OF HYDROSTATIC OR HYDRODYNAMIC ORIGIN (THRUST FORCES) UNLESS RESTRAINED EXTERNALLY CAN RESULT IN PIPE MOVEMENT AND SEPARATION OF JOINTS IF THE JOINTS OF THE SYSTEM ARE NOT OF A RESTRAINED JOINT DESIGN. SEE SECTION 13.3.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:23:07 2005

9. HANGER AND SUPPORT SPACING

9.1 The maximum spacing of hangers and supports shall be as shown in Table 3.

9.2 Spacings less than shown in Table 3 may be required to conform with building structure loading limitations and standard product load ratings.

9.3 Minimum rod diameters for rigid rod hangers are listed in Table 4.

9.4 When periodic dismantling of a piping system for cleaning, etc. is anticipated, the design engineer shall specify any required additional supports.

9.5 For piping systems using type 40 protection shields for insulated piping, see Table 5 for spacing.

10. PIPE ATTACHMENTS FOR INSULATED LINES

10.1 The connections to pipe attachments shall be outside the insulation so that movement of the line shall not cause damage to the insulation.

10.2 Insulation protection shields shall be provided to protect the vapor barrier of insulation on cold lines. Under no circumstances shall hangers, supports or guides be applied directly to horizontal pipe or tubing on vapor barriered lines. (See Table 5.)

5 - 6	18	457	16	.060	10	3.0
8	24	610	14	.075	10	3.0

NOTES: The listed spans and shield lengths are based on insulation with a compressive strength of 15 psi (103kPa). For insulation with compressive strengths greater than 15 psi (103kPa), span may be increased proportionately up to the maximum allowable as listed in Table 3. Spans marked * are the maximum allowable.

Protection shield gages listed are for use with band type hangers only. For point loading, increase shield thickness and length. When shields are used with rollers, shield thickness shall be adjusted accordingly and shield lengths shall be increased to keep rolling point of contact within the middle one-third of the shield length. For compressive strengths other than 15 psi (103kPa), shield dimensions may be adjusted accordingly.

10.3 For cryogenic piping systems, shields incorporating rigid, high density polyurethane foam inserts or other load bearing insulation should be used. The support should include means for maintaining vapor barrier integrity. Because of the temperature/compressive strength relationship of polyurethane foam, the recommended shield designs shown in Table 5 do not apply. Shields must be designed to accommodate loading conditions at both the installation and operating temperature.

11. MULTIPLE SUPPORTS

11.1 Horizontal banks of piping may be supported on a common base member without regard to the pipe centerline elevation. The particular method of support to be used shall be as required by the engineering design.

11.2 In the supporting of multiple pipe runs, provisions shall be made to keep the lines in their relative lateral positions, using clamps or clips as required. Lines subject to thermal expansion shall be free to roll axially or slide.

12. RISER SUPPORTS

12.1 The selection and location of riser supports shall take into consideration the entire weight of the riser, and adjacent piping, hydrostatic test load conditions, line temperature and available supporting structure. On a riser subject to expansion, only one support of the rigid type shall be used.

12.2 Riser clamps (Type 42) shall have a positive means of engagement between the pipe and the clamp.

12.3 Rigid riser clamps (Type 42), when used for deadweight purposes, shall be designed for two times the calculated load.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:23:08 2005

13. ANCHORS, GUIDES AND RESTRAINTS

13.1 Anchors, guides and restraints shall be located by the specifications and/or drawings. Should the need or the desirability of relocating, eliminating or adding anchors, guides or restraints arise, such changes shall be brought to the attention of the design engineer for consideration and approval.

13.2 Anchors, guides and restraints shall be designed for imposed loadings as determined by the design engineer. For guided systems in the absence of specific lateral loads, the guide shall be designed for 20% of the dead weight load as a minimum.

13.3 For pressure piping with joints not having a restraining design, other positive restraining means such as clamps, rods and/or thrust blocking shall be used to maintain the integrity of the joints.

13.4 The necessity for, and the location of, shock suppressors and seismic control devices shall be as determined by the design engineer.

13.5 The location, type and number of corrective devices which may be necessary to control any unforeseen vibrations, as determined after the piping is in service, are not a part of this standard.

14. FIRE PROTECTION SYSTEMS

14.1 Hangers and supports for fire protection systems shall conform to the following standards published by the National Fire Protection Association in the National Fire Codes for fixed extinguishing equipment:

NFPA-11—Foam Extinguishing Systems
NFPA-12—Carbon Dioxide Systems
NFPA-13—Installation of Sprinkler Systems
NFPA-14—Standpipe and Hose Systems
NFPA-15—Water Spray Systems
NFPA-16—Foam Water Systems
NFPA-17—Dry Chemical Extinguishing Systems

14.2 Hangers, in general, are covered in NFPA-13. If the system is other than a standard water sprinkler system, the applicable NFPA Standard shall also be consulted.

15. DUCTILE IRON PIPING

15.1 The size of hanger components shall be suitable for the O.D. of the pipe to be supported.

15.2 For buried lines, supporting means that may be required due to soil conditions or settlement of terminal points, shall be specified by the design engineer.

16. CAST IRON SOIL PIPING

Requirements shall be as set forth in Section 15 except for spacing as noted in Table 3.

17. GLASS PIPING

17.1 Hangers shall be provided with pads or cushions on the bearing surfaces to prevent scratching the pipe. The hangers shall fit loosely around the pipe yet contact it through the pads or cushions in a manner to distribute the load over the largest possible area. Point loading shall be avoided. The system of hangers shall be designed with the least practical number of rigid anchor points. Supports for vertical piping and all anchors shall be as recommended by the pipe manufacturer.

17.2 Hangers shall be placed approximately one foot (305mm) from each side of fittings or couplings. At least two hangers shall be used for each 10-foot (3.0m) section.

18. PLASTIC PIPING

18.1 Rigid plastic piping shall normally be supported by the same type of hangers used with steel pipe.

18.2 In pressure applications, hangers shall be provided with pads or cushions on the bearing surfaces to prevent scratching the pipe. The hangers shall fit loosely around the pipe yet contact it through the pads or cushions in a manner to distribute the load over the largest possible area. Point loading shall be avoided. The system of hangers shall be designed with the least practical number of rigid anchor points. Supports for

vertical piping and all anchors shall be as recommended by the pipe manufacturer.

18.3 Support spacing shall be based on the manufacturer's recommendations for the service conditions.

18.4 Flexible plastic tubing or rigid plastic pipe operating at temperatures high enough to materially lower its strength, shall be supported continuously.

19. FIBERGLASS REINFORCED PIPE (FRP)

19.1 The size of hanger shall be suitable for the O.D. of the pipe to be supported.

19.2 Support spacing shall be based on the manufacturer's recommendations for the service condition.

19.3 FRP should not be point loaded and all shields and hangers in contact with the pipe shall be free of burrs.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Non-toleranced dimensions in this Standard Practice are nominal, and, unless otherwise specified, shall be considered "for reference only".

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-73, 1991 (Reaffirmed 1996), with permission of the publisher, the Manufacturers Standardization Society.' BRAZING JOINTS for COPPER and COPPER ALLOY PRESSURE FITTINGS

1. SCOPE

This standard covers joints for installations assembled by brazing into a piping system with BAg or BCuP materials. This standard is allied to American National Standards ASME B16.18-1984 (R94), Cast Copper Alloy Solder Joint Pressure Fittings, and ASME B16.22-1995, Wrought Copper and Copper Alloy Solder Joint Pressure Fittings. It was developed for the purpose of providing dimensional information in regard to recommended minimum fitting ends suitable for brazing for the Pressure-Temperature Ratings of Table 1.

2. DESCRIPTION

Fittings shall be the same types and kinds and shall meet all requirements of ASME Standards B16.18 and ASME B16.22 with the following exceptions:

a) Pressure-temperature ratings (See Table 1).

b) Dimensions of ends (See Table 2).

c) Center-to-end and end-to-end dimensions prescribed by ASME B16.18 may be reduced in accordance with the variations of the solder joint end dimensions of the standard.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-89, 1998, with permission of the publisher, the Manufacturers Standardization Society.' Reproduction prohibited under copyright convention unless written permission is granted by the Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.

Unless otherwise specifically noted in this MSS SP, any standard referred to herein is identified by the date of issue that was applicable to the referenced standard(s) at the date of issue of this MSS SP. (See Annex A.)

U.S. customary units in this SP are the standard; the metric units are for reference only.

This document has been substantively revised from the previous edition. It is suggested that if the user is interested in knowing what changes have been made, that direct page by page comparison should be made of this document.

FOREWORD

This standard was developed by a cooperative effort of representatives of the pipe hanger manufacturers. It is based on the best practice current at this time and on the collective experience of the industry. There are two companion standards, MSS SP-58, and MSS SP-69, relating to hanger materials, design, manufacture, fabrication, selection and application. In addition, The MSS Pipe Hanger Committee has developed guidelines for pipe supports contractual relationships and on hanger terminology as covered in MSS SP-77 and MSS SP-90 respectively.

PIPE HANGERS AND SUPPORTS - FABRICATION AND INSTALLATION PRACTICES

1. OBJECTIVE

1.1 To serve as a guide to the fabricator and erector of pipe supports, so they may understand their mutual responsibilities.

1.2 To furnish the erector, who may not be familiar with engineered pipe supports, a guide for the proper installation of these supports.

1.3 To serve as a companion document to MSS SP-58 which provides recommendations for materials, design and manufacture of pipe hangers and supports.

1.4 To serve as a companion document to MSS SP-69 which provides recommendations for the selection and application of pipe hangers and supports.

2. SCOPE

2.1 This Standard Practice establishes recommended procedures for detailing, fabrication and installation of pipe hangers and supports. These procedures supplement, but do not replace, those of the manufacturer.

3. PIPE HANGER ASSEMBLY DRAWINGS

3.1 Description

3.1.1 This section contains recommendations for minimum data which should appear on hanger drawings to enable the fabricator to furnish, and the erector to install the hanger assembly, as intended by the job specification or purchase order conditions.

3.2 General

3.2.1 The conventional 8 ½ x 11 inch hanger draw-ing shall contain the information necessary for shop fabrication and field installation of the hanger assembly. In the case of complex assemblies, supplementary or larger, 11 x 17 inch sheets may be used.

3.2.2 The data shown on the hanger drawing should consist of:

a) Drawing of the assembly (Subsection 3.3)
b) Bill of material (Subsection 3.4)
c) Load and movement data (Subsection 3.5)
d) Supplementary steel (Subsection 3.6)
e) Field and shop welds (Subsection 3.7)
f) Protective coating (Subsection 3.8)
g) Location plan (Subsection 3.9)
h) Identification (Subsection 3.10)
i) Reference drawings (Subsection 3.11)

3.3 Drawing of the Assembly

3.3.1 Drawing shall be a pictorial representation of the assembly showing each component part identified to a bill of material item.

3.3.2 Dimensioning of the hanger assembly depends upon the complexity of the design. As a minimum, the following data should be shown:

a) The overall dimension from the supporting structure to the center line or bottom of the pipe.

b) The orientation, elevation, size and type of supporting structure.

c) Pipe size (nominal pipe size unless otherwise noted) and insulation thickness as applicable.

d) Pipe elevation.

e) Other dimensions necessary for the fabrication and installation of the complete hanger assembly.

f) Unless otherwise required, all dimensions shall be to the nearest one eighth inch (3 mm).

3.4 Bill of Material

3.4.1 An itemized bill of material shall be provided listing all components of the hanger assembly. Identification of standard catalog

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:19 2005

components shall be made by manufacturers figure number, type and size. Appropriate material specification shall be shown for special components.

3.5 Load and Movement Data

3.5.1 When required, the maximum operating load to be supported by the assembly shall appear on the drawing. Hydrostatic test loads, greater than operating loads, shall also be shown. When special loading conditions are considered, these loads shall also be shown.

3.5.2 When variable spring or constant support hangers are used, the direction from hot to cold and amount of vertical movement shall be shown.

3.6 Supplementary Steel

3.6.1 When supplementary steel is furnished as a part of the hanger assembly, it shall be listed in the bill of material.

3.6.2 When supplementary steel is required, but not furnished as part of the hanger contract, it should be so noted.

3.7 Field and Shop Welds

3.7.1 All shop welds of non-catalog items and all field welds shall be indicated on the drawing.

3.7.2 It is recommended that American Welding Society (AWS) standard weld symbols be used.

3.7.3 Welds required to provide final installation, access around pipe, or necessary to accommodate shipping and handling limitations, shall be specified as field welds.

3.8 Protective Coatings

3.8.1 Where required, the type and/or specification of protective coating shall be indicated on the drawing, or other referenced documents.

3.9 Location Plan

3.9.1 The location plan shows the relationship of the pipe and hanger to applicable reference lines, such as column lines, center lines of equipment, etc. (See Figures 1 and 1A). The location of the structural attachment is usually indicated by an "X" and is dimensioned to the north-south and east-west reference lines. A north arrow is usually shown.

3.9.2 Where horizontal piping displacement exceeds 1 inch (25 mm), it is common practice to offset the pipe attachment or structural attachment by the amount of anticipated displacement or a percentage thereof (See Figures 1 and 1A, Illustrations 2, 4 and 6).

3.10 Identification

3.10.1 Identification on the hanger drawing shall consist of, but not be limited to, the following:

a) Project identification
b) Piping system
c) Hanger mark number
d) Drawing and revision number

3.11 Reference Drawings

3.11.1 As a minimum, reference should be made to pertinent piping and/or structural drawings, including revision number.

4. DIMENSIONAL TOLERANCES

4.1 Description

4.1.1 This section covers recommended maximum tolerances in fabricated pipe hangers and supports, including those shown in the Figure 1 Type Charts of MSS SP-58, SP-69 and SP-90, except for cast or forged products and cold wound springs.

4.2 General

4.2.1 Tolerances for raw materials such as strip, sheet, bar, plate, pipe, tubing, structural and bar size shapes, bolting, hot wound springs and cold wound springs shall be in accordance with recognized standards or specifications.

4.2.2 Tolerances for castings, forgings and extrusions shall be to the individual manufacturer's standard.

Wed Feb 02 02:24:19 2005

TABLE 1. CLAMP TOLERANCES

Clamp, I.D.	Diameter	Pipe Centerline to Load Bolt Hole
up to 2 in. (51 mm)	± 1/16 in. (2 mm)	± 1/8 in. (3 mm)
over 2 in. to 4 in. (51 to 102 mm)	± 1/8 in. (3 mm)	± 1/8 in. (3 mm)
over 4 in. to 8 in. (102 to 305 mm)	± 3/16 in. (5 mm)	± 1/4 in. (6 mm)
Over 8 in. to 18 in. (305 to 457 mm)	± 1/4 in. (6 mm)	± 3/8 in. (10 mm)
Over 18 in. to 30 in. (457 to 762 mm)	± 3/8 in. (10 mm)	± 1/2 in. (13 mm)
Over 30 in. (762 mm)	± 1/2 in. (13 mm)	± 1/2 in. (13 mm)

Notes:
(a) Clamp I.D. equals pipe or tubing O.D. plus suitable clearance as established by the clamp manufacturer.
(b) Clamp I.D. measured at one half of the clamp width.
(c) Dimensions shown are in inches. Dimensions in parentheses are in millimeters.

4.3 Fabricating Tolerances

4.3.1 Cut to length - linear

a) Hanger rods ± ½ in. (13 mm)

b) Structural shapes, pipe and tubing for critical assembly make up dimensions ± 1/8 in. (3 mm). Squareness of cut 1 degree, not to exceed 1/8 in. (3 mm) offset.

c) Plates and bars for critical dimensions ± 1/8 in. (3 mm). Squareness of cut 1 degree, not to exceed 1/8 in. (3 mm) offset.

d) Tolerances for non-critical dimensions shall be to the individual manufacturer's standards.

4.3.2 Clamps for pipe and tubing, formed and fabricated, are shown in Table 1.

4.3.3 Threads

a) Screw threads - Shall be in conformance with ANSI/ASME B1.1-1989 or National Bureau of Standards Handbook H-28, UNC 2A / 2B for the coarse thread series and 8UN 2A / 2B for the eight thread series.

b) Pipe threads - Standard straight pipe threads for supports such as Type 38 shall be ANSI/ASME B1.20.1-1983 NPSM and NPSL, Standard Straight Pipe Threads.

c) Tapered pipe threads - Shall be in conformance with ANSI/ASME B1.20.1-1983 NPT

4.3.4 Weld Size

a) All welds - plus only, no minus.

4.3.5 Angularity

a) All forming operations ± 4 degrees.

4.3.6 Punched Holes

a) Location - center to edge, or center to center ± 1/8 in. (3 mm).

b) Diameter - plus 0.2 times metal thickness or minus 1/32 in. (1mm).

4.3.7 Drilled Holes

a) As specified on manufacturer's drawings.

4.3.8 Machined Parts

a) As specified on manufacturer's drawings.

5. FABRICATION

5.1 Description

5.1.1 This section covers shop fabrication of hanger components and assemblies.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:20 2005

5.1.2 Where service conditions necessitate consideration of special treatment not covered in this section, such requirements should be a matter for individual discussion and agreement between the purchaser and the fabricator.

5.2 General

5.2.1 Fabrication tolerances shall be in accordance with Section 4.3 of this document.

5.2.2 Identification should be maintained during the fabrication process.

5.3 Material Cutting

5.3.1 Plates, rods, bars, etc. which are used for the fabrication of hanger assemblies may be cut to shape or size by shearing, sawing, machining, grinding or thermal cutting.

5.3.2 When required, material identification for each piece of material cut shall be maintained by color coding, tagging, stamping or other suitable means.

5.3.3 When thermal cutting is performed, the process shall be suitable for the material to which it is applied.

5.3.4 After thermal cutting, slag should be removed prior to further fabrication or use. Discoloration remaining on the cut surface is not considered to be detrimental.

5.4 Forming

5.4.1 Forming shall be performed in accordance with MSS SP-58, Section 5.

5.5 Machining, Drilling and Punching

5.5.1 These operations shall be performed as required by drawings and specifications.

5.6 Threading and Tapping

5.6.1 Screw threads shall be in conformance with ANSI/ASME B1.1 or National Bureau of Standards Handbook H-28, UNC 2A / 2B for the coarse thread series and 8UN 2A/2B for the eight thread series.

5.6.2 Standard straight pipe threads for supports such as Type 38 shall be ANSI/ASME B1.20.1 NPSM and NPSL, Standard Straight Pipe Threads.

5.6.3 Tapered pipe threads shall be in conformance with ANSI/ASME B1.20.1 NPT

5.6.4 Special thread forms and fits other than those specified by this subsection shall be used only when both male and female threaded members are furnished as part of a permanent assembly.

5.7 Welding

5.7.1 Welding shall be done in accordance with MSS SP-58 subsection 5.6.

6. PROTECTIVE COATINGS

6.1 Description

6.1.1 This section covers shop application of protective coatings.

6.1.2 Protective coatings fall into two general types: Metallic Coatings and Non-metallic Coatings.

6.1.3 The type of protective coating used for hanger material shall be the fabricator's standard coating unless otherwise specified.

6.2 Metallic Coatings

6.2.1 Electroplating, hot dip galvanizing and mechanical plating shall be in accordance with MSS SP-58, Subsection 6.1. Other metallic coatings may be selected for specific purposes.

6.3 Non-metallic Coatings

6.3.1 Non-metallic coatings for specific purposes shall be in accordance with the recommendations of MSS SP-58, Subsections 6.2.

6.3.2 When standard shop paint is required, fabricated hanger material shall receive one shop coat of good quality rust inhibitive primer (fabricator's standard paint).

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:20 2005

6.3.3 Special shop paints and surface prep shall be applied in accordance with approved procedures.

6.3.4 Material surfaces shall be prepared for coating by removal of loose scale, loose weld spatter and other foreign material. Removal may be done by scraping, wire brushing or other suitable means. Blasting or pickling need be done only when specified.

6.3.5 Application of coatings shall be in accordance with the coating manufacturer's recommendations.

6.3.6 Rod threads for field adjustment shall not be painted. Bolt threads in assembled components may be painted. When specified, external adjustment threads shall receive a coating of rust preventative compound.

6.3.7 Stainless steel or other corrosion resistant material need not be painted.

6.3.8 Small items such as beam attachments which are to be welded to existing steel need not be painted.

7. TESTING OF HANGER COMPONENTS

7.1 Description

7.1.1 This section defines the testing of hanger components and gives the purpose for tests in each category.

7.1.2 This section also recommends the type of records for each category of test.

7.2 Classification

7.2.1 Testing of hanger components falls into three categories:

a) Design Proof Test
b) Qualification Test
c) Calibration Test

7.3 Design Proof Test

7.3.1 Design Proof tests may consist of tests for both strength and function. Tests should be performed using calibrated test equipment.

7.3.2 Strength tests are performed to prove the adequacy of the final design as to allowable stress or safety factor criteria. Tests may be physical, analytical or a combination of both.

7.3.3 Physical Test Method (a or b)

a) This test shall consist of loading to destruction a sufficient number of hanger components of one size and design to establish a minimum failure load to which a factor can be applied for safe load rating purposes. A single test sample is permitted, but in this case, the load rating shall be decreased by 10%.

b) This test shall consist of loading to destruction a sufficient number of hanger components of one size and design to establish a failure mode that can be related to the results from standard test bars made from the same material as the hanger components. This test is used to establish a safe load rating at the allowable stress level of the hanger component material.

7.3.2.2 Analytical Test

a) This test shall consist of applying analytical methods and formulae to the structure of a hanger component to determine stress levels and conditions within that structure. This test is used to establish a safe load rating at the allowable stress level of the hanger component material.

7.3.2.3 Physical and Analytical Test

a) This test shall consist of physical tests described in 7.3.3 (b) and applying these results analytically to a family of hanger components of the same design form. This test is used to establish a safe load rating for each component size at the allowable stress level of the hanger component material.

7.3.3 Function tests are performed to prove the ability of a component to meet the design criteria at rated load.

7.3.4 Results of Design Proof Tests should be presented in report form. Since this report may contain proprietary information, a summary report is acceptable.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:20 2005

7.3.5 After Design Proof Tests are complete, they need not be repeated unless significant dimensional or material changes are made in the hanger component.

7.4 Qualification Test

7.4.1 Qualification Tests are performed to assure that hanger components meet or exceed the minimum requirements of particular codes or approval agencies. Test equipment should be of the same type and condition as for Design Proof Test. Design Proof Tests may serve as Qualification Tests. Qualification Tests may be performed by the hanger component manufacturer or by an approval agency.

7.4.2 Results of Qualification Tests should be presented in a report form suitable for distribution.

7.4.3 Except as required by the approval agency, Qualification Tests need not be repeated unless significant dimensional or material changes are made in the hanger component.

TABLE 2. INSPECTION CHECK LIST

INSPECTION CATEGORIES	TYPES OF INSPECTION		
	Receiving	In Process	Final
1. Drawings and/or Specifications		X	X
2. Material Identification	X	X	X
3. Fabrication Procedure		X	
4. Dimensions	X	X	X
5. Surface Finish	X	X	X
6. Surface Preparation		X	
7. Protective Coating	X	X	X
8. Performance		X	X
9. Marking	X	X	X
10. Documentation	X	X	X
11. Packaging		X	X

7.5 Calibration Test

7.5.1 Calibration Tests are performed on some types of individual hanger components, such as constant supports, to assure that they are properly calibrated to meet specific installation requirements. Calibration Test equipment may be the same used for Design Proof and Qualification Test; or it may be specific equipment for the Calibration Tests performed. The test equipment shall be periodically calibrated to insure reliable results.

7.5.2 Records of Calibration Tests should be retained by the manufacturer.

7.6 Quality Control

7.6.1 Quality Control should be exercised over the procurement of raw materials, fabrication procedures and dimensions to assure the continued validity of Design Proof and Qualification Tests.

8. INSPECTION

8.1 Description

8.1.1 This section covers recommendations for quality control and inspection of pipe hanger components and assemblies.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:21 2005

8.2 General

8.2.1 There should be an inspection program to ensure that all aspects of work performed comply fully with all specified requirements.

8.3 Inspection Program

8.3.1 Table 2 designates the suggested check points that should be included in an inspection program.

9. PACKAGING, MARKING, SHIPPING, RECEIVING AND STORAGE

9.1 Description

9.1.1 This section covers the recommendations for packaging, marking, shipping, receiving and storage of hanger components and assemblies.

9.1.2 Special requirements not covered in this section should be a matter for discussion and agreement between the purchaser and supplier.

9.2 Packaging

9.2.1 General

9.2.1.1 Hangers should be assembled to the degree practical, taking into account shipping and handling limitations. Constant supports, variable springs and similar items may be packaged, skidded or shipped loose, separate from the remaining assembly components.

9.2.1.2 Where possible, each hanger assembly should be shipped complete.

9.2.1.3 Hanger assemblies or subassemblies shall be properly marked with identifying numbers. Random material may be identified in bulk.

9.2.1.4 Each hanger shipment shall contain a packing list identifying the material included in the shipment, also noting the total number of boxes, bundles, bags, etc. making up the shipment.

9.2.2 Containers

9.2.2.1 Where size permits, hanger assemblies and subassemblies may be packed in the manufacturer's standard containers.

9.2.3 Bundles

9.2.3.1 Hanger assemblies, steel members, welded brackets, etc. which are too large for the standard containers should be bundled and banded for shipment.

9.2.4 Loose Components

9.2.4.1 Large rigid components, which do not require special protection during shipment, need not be packaged.

9.2.5 Bags

9.2.5.1 Small loose items may be placed in bags. The bags may be shipped separately or placed in containers for shipment.

9.2.6 Pallets and Skids

9.2.6.1 Hanger components may be palletized for shipment to facilitate handling as a compact unit.

9.3 Marking for Shipment

9.3.1 General

9.3.1.1 Marking shall be accomplished by use of labels, stamping, printing or tagging.

9.3.1.2 Marking shall be applied with waterproof ink or paint.

9.3.1.3 Labels shall be of water resistant type.

9.3.1.4 Tags may be cloth, paper, plastic or metal and affixed by waterproof adhesive, tacks or wire.

9.3.2 Container marking by stenciling, printing or labeling should appear in a minimum of two locations, preferably on one side and one end.

9.3.3 Bundles and bags shall be tagged.

9.3.4 Loose components, pallets and skids may be stenciled, labeled or tagged.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:21 2005

9.3.5 Marking should include the following information when applicable:

a) Consignee name, street address, city, state, zip code and country.

b) Consignor name, street address, city, state and zip code and country.

c) Purchase order or contract number. Package number followed by the total number of packages in the shipment.

d) Material identification number, e.g., hanger mark numbers or manufacturers figure numbers and quantity. A packing list may be used in lieu of material identification. The container in which the packing list is enclosed shall be clearly identified.

e) Special handling instructions, e.g., use no hooks, lift points, keep dry, stacking limitations, etc.

f) Weight of package.

g) Special instructions.

9.4 Shipping

9.4.1 Shipping shall be in accordance with the method, routing and sequence as required by the purchase document.

9.4.2 The location of the packing list should be indicated on the bill of lading.

9.5 Consignee Receiving

9.5.1 The receiving clerk should be responsible for verifying agreement between the bill of lading and the shipment as received. Any damage or shortage should be noted on the bill of lading and the shipper and carrier immediately notified.

9.5.2 Unloading should be done with reasonable care, taking note of any precautionary notices on the containers. Items of shipment should not be dropped.

9.6 Consignee Storage

9.6.1 Storage should be in a dry area, enclosed for security purposes, and protected from the direct effects of weather and contaminants.

9.6.2 It is recommended that containers be opened and contents verified before they are placed in the storage area.

9.6.3 It is recommended that a system be established to facilitate retrieval of material from storage.

10. HANGER INSTALLATION PRACTICES

10.1 Description

10.1.1 This section outlines the recommended field practices for field personnel during hanger installation, adjustment, testing and inspection.

10.2 General

10.2.1 Installation control shall be as defined in the owners job specifications for each classification of piping.

10.2.2 Installation information may be in any of the following forms:

a) Completely engineered: individual hanger assembly drawings.

b) Semi-engineered: typical hanger type drawings and approximate locations for field fabricated supports using preselected bulk hanger material.

c) Random: guidelines for location, hanger type selection and installation of supports using preselected bulk hanger material where all operations are performed by the field forces.

10.2.3 Relocation and reorientation of any hanger or restraint from the specified location shall not be permitted beyond that which is established by the responsible hanger designer, without his expressed permission.

10.2.4 Installed hangers or hanger components shall be used for their intended purpose. They shall not be used for rigging or erection purposes.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:21 2005

10.2.5 Recommended maximum applied torque for set screws in C-clamps (types 19 & 23) is listed below:

Thread Size		Torque	
Inch	(mm)	Inch Pound	(Nm)
1/4	6.4	40	4.5
3/8	9.6	60	6.8
1/2	12.7	125	14.1
5/8	15.8	250	28.2
3/4	19.0	400	45.2
7/8	22.2	665	75.1

Note: Caution should be taken not to overtighten the set screw.

10.2.6 Hangers that are installed with clearance for future insulation shall be properly supported with blocks at three points approximately 60 degrees apart around the lower circumference. These blocks shall be the thickness of the intended insulation to prevent distortion of the hanger assembly.

10.3 Planned Installation Sequence

10.3.1 The hanger designer assumes responsibility for avoiding hanger interference with all piping, electrical trays, ducts and equipment specifically dimensioned on drawings made available to him. Studies are made to avoid such interferences during the design phase of pre-engineered hangers; however, the hanger designer cannot assume responsibility for any resulting interference caused by field run piping, electrical conduits, instrumentation, added steel framing, etc.

10.3.2 The hanger installer should be cognizant of the total amount of piping and equipment to be installed in any given area. He should develop an installation sequence giving priority to major components and strata of piping closest to the supporting structure. The installer also should review routing of field run piping in order to reserve space for known components to be installed at some later date in order to minimize revamp work. He should coordinate erection of all piping with other trades to maintain erection clearances and availability of building structure for supporting functions.

10.4 Hanger Locations

10.4.1 Completely engineered hangers shall be located in strict accordance with the hanger design detail drawings. It is normal design practice to dimension the location of hanger attachments from the building structure column lines. Refer to Section 3, subsection 3.9 of this document for complete description.

10.4.2 Semi-engineered hangers for which approximate locations are designated shall be so located.

10.4.3 Random hangers shall be located by the hanger installer in accordance with the allowable support spacing in MSS SP-69, Table 3.

10.4.4 When initially installed, all hangers shall be adjusted to establish the piping at the designated elevation.

10.5 Hanger Installation

10.5.1 Rod Hangers

10.5.1.1 Rod hangers, either rigid or spring type, are adjustable vertical assemblies consisting of structural attachment, hanger rod (with or without intermediate components) and pipe attachment.

10.5.1.2 Installation of rod hangers requires either direct attachment to building structure or to supplemental framing.

10.5.1.3 Attachment to the building structure may be by beam clamps, welding of clips to steel members or concrete embedded plates and by use of concrete inserts or fasteners. Where there is a vibration or bending consideration, hanger rods should not be connected directly to driven or drilled concrete fasteners. In these instances an intermediate attachment should be used from which the rod can be suspended using a swing connection.

10.5.1.4 Supplemental framing may be angles, channels, tubular sections or beams either bolted or welded to existing steel structure or attached to concrete.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:21 2005

10.5.2 Brackets

10.5.2.1 Brackets are cantilevered members with or without a kneebrace, designed to withstand the gravity load and horizontal forces.

10.5.2.2 When the installer has responsibility for design or selection of brackets, anticipated horizontal forces should be considered.

10.5.2.3 Brackets may be installed by welding or bolting to structure, poured in place embedments, or through the use of drilled concrete fasteners.

10.5.2.4 For bolted-on brackets, it is important to tighten threaded fasteners equally to assure proper load distribution.

10.5.3 Anchors

10.5.3.1 Anchors may be weldments or clamp type.

10.5.3.2 Anchors are used to fix selected points on a piping system in order to control forces, moments and thermal movement in each section of the total pipe run. Location shall be accurately maintained for both horizontal and vertical piping to preserve the designer's flexibility concept.

10.5.3.3 Anchors shall not be added or relocated without the approval of the piping designer.

10.5.3.4 Installation of anchors may be by bolting or welding to a rigid structure capable of withstanding all the design forces. Pipe is secured to the anchor by clamping, welding or both.

10.5.4 Guides

10.5.4.1 Guides may be sliding, rolling or spider types.

10.5.4.2 Guides are used to control piping movement, provide lateral stability, control sway and assure proper piping alignment at expansion joints and loops. Spider guides used in the horizontal position are not normally considered to be pipe support elements.

10.5.4.3 Design is based upon thermal movement, load, direction of travel and thickness of pipe insulation.

10.5.4.4 Installation of guides may be by bolting or welding the base, frame or shroud to the supporting structure. Care must be taken at time of initial installation to maintain the proper alignment elevation and clearances. On insulated lines, saddles or fins should be attached to piping to prevent damage to insulation.

10.5.5 Base Type Supports

10.5.5.1 Base type supports are used to support the piping from below. They encompass a family of supports, guides, slides, anchors, springs, etc.

10.5.5.2 Attachment to pipe may be by bolted on clamps, U-bolts or welding. Load is transferred through the use of a cradle, pipe or structural member which may be fastened directly to building structure or provided with a base plate suitable for incorporation into the particular type support involved.

10.5.5.3 When attaching to steel structure, proper piping elevation can be established by custom fitting the vertical member, or by using telescoping pipe or other means of adjustment.

10.5.5.4 When attaching to concrete structure, the use of leveling bolts under the base plate with subsequent grouting is an additional means to provide proper piping elevation.

10.5.5.5 During installation, the supported pipe should be adequately braced to maintain stability until the system is completely installed.

10.6 Hanger Adjustment

10.6.1 To compensate for pipe elevation discrepancies, hangers are usually provided with means to permit vertical adjustment during and after installation. Threaded devices using turnbuckles, clevises, etc. provide this feature or the adjustment is inherently available in the hanger design. No adjustment shall be made that will result in less than full usable thread engagement.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:22 2005

10.6.2 Adjustability features also serve to facilitate pipe load distribution.

10.6.3 For small size piping, the necessity for adjustment can be detected visually. For large or heavy piping, the necessity for adjustment may not be as obvious and the installer must determine that each hanger or support substantially carries its proper load. Hanger drawings usually denote the operating and hydrostatic loads.

10.6.4 Upon completion of hanger installation, all adjustments having the possibility of turning shall be locked securely in place; double nutting being the most common means. It is not recommended to break threads or tack weld as a means of locking adjustment devices.

10.6.5 Hydrostatic testing, when required, should not be performed until all hanger assemblies have been properly installed, adjusted and loaded in accordance with the hanger drawings. Built in hydrostatic stops, or external means for supporting the added water weight, must be installed in accordance with the Hydro Test Procedures.

10.6.6 After completion of hydrostatic tests of the piping system, any devices (e.g., spring travel stops, temporary supports, etc.) furnished for hydrostatic test purposes must be removed.

10.6.7 Hangers for certain piping systems may be required to be checked for adjustment during initial run at operating temperature. Particular attention should be given to spring hangers and spring supports.

10.6.8 Constant type springs have specific load adjustment devices which can vary the spring effort by plus or minus some percentage from the factory set load. Variable type springs are usually provided with turnbuckles, threaded collars or adjustment nuts to enable varying the spring effort. Load/travel scales on variable and constant type spring units are usually marked to show the position of the load/travel indicator in both the cold and hot positions. Reference should be made to the particular spring suppliers catalog for the location and operation of these devices.

10.6.9 If, at operating temperature, the load/travel indicator does not line up with the hot position marking, further adjustment may be required. However, before any adjustment is considered, the position of the load/travel indicator on all spring units on the system should be recorded (see Figure 2 for suggested form). The cause for the misalignment should then be investigated.

10.6.9.1 Prior to initial operation all spring hanger units are set to the cold position. This position of the load/travel indicator should be the initial entry in a permanent formal log. (See figure 2 for suggested form)

10.6.9.2 When the system reaches operating temperature a second set of load/travel indicator position readings should be recorded.

10.6.9.3 If at operating temperature, the load/travel indicator does not line up with the hot position marking, it is recommended that a minor travel adjustment be made (either lengthen or shorten the hanger rod) to have the indicator line up with the hot marking. If the installation does not respond to this minor travel adjustment, then consult with an experienced hanger designer. A new set of load/travel position readings should be recorded with a notation on the log that adjustment has been made. This set of readings represents the system being supported in accordance with the designers initial design concept which is to have the piping properly supported in the hot position.

10.6.9.4 All future studies should use this final adjusted set of hot readings as the base line.

10.6.9.5 Subsequent sets of readings, taken after the system has been cycled through hot and cold conditions, will provide the opportunity to evaluate the possible need to make load adjustments on some group of adjacent hangers to bring a section of piping run to proper elevation. This evaluation should be made only by an experienced hanger designer.

10.6.9.6 The plant should establish a program to have a periodic inspection of critical piping support systems and load/travel indicator readings recorded and compared to the base line set of readings. Although the load/travel indicator may not line up exactly with the base line readings, the hanger may still be considered functional if the reading is close to the base reading.

10.6.9.7 Spring units must never be topped or bottomed out. This is an indication that the working travel range has been exceeded.

Wed Feb 02 02:24:22 2005

10.6.10 Some possible causes for improper alignment of the load/travel indicator at operating temperature include:

a) Improper load adjustment of hanger.

b) Improper load adjustment of adjacent hangers.

c) System not at full operating temperature.

d) Pipe fabrication error.

e) Improper cold springing.

f) Frictional effects of guides or sliding supports.

g) Discrepancies between design and "as built" conditions affecting hanger loads or movement.

h) Improper hanger installation or failure to remove temporary supports, restraints, or hanger travel stops.

i) Failure to clear piping system of obstructions.

10.7 Inspection

10.7.1 Inspection after installation and prior to hydrostatic testing.

10.7.1.1 Each hanger assembly should be verified against the hanger drawing to assure that all components have been installed and are in their proper position. This also includes temporary hangers and supports that may be required for hydrostatic testing and spacer blocks for lines still to be insulated.

10.7.1.2 Threaded components of each hanger should be checked for proper thread engagement.

10.7.1.3 Locking nuts on threaded components, cotter pins, temporary locking devices (travel stops) and other locking means furnished with spring units should be properly engaged.

10.7.1.4 When possible, springs should be oriented for convenient reading of load/travel scales. Scales found to be damaged should be removed and replaced. Prior to removal, the exact position of the scale should be noted and replacement installed in the same location.

10.7.1.5 Restraint control devices utilizing hydraulic fluids should be checked for tight seals and proper amount of fluid. If it is found necessary to add fluid, it must be of the type specified by the restraint supplier.

10.7.1.6 Sliding supports using teflon, graphite, bronze, or steel to steel slide plates must be installed in strict accordance with hanger detail drawings with particular attention to offset dimensions and clearances when such are specified. All sliding surfaces must be free of foreign matter.

10.7.2 Inspection after hydrostatic testing and prior to heating up.

10.7.2.1 Spring locking devices and any temporary hangers and supports required for hydrostatic testing shall be removed.

10.7.2.2 Spring hangers should be checked to insure that their load/travel indicators are approximately in their cold position setting and that the pipe is at the proper elevation.

10.7.2.3 Restraint control devices should be checked to insure that their travel indicators are approximately at their cold position setting.

10.7.2.4 Actual cold positions of the load/travel indicators on springs and restraint control devices should be recorded in a permanent formal log. See Figure 2 for suggested form.

10.7.3 Inspection at operating conditions

10.7.3.1 Piping systems should be inspected in their entirety to verify that no interference exists between the pipe and/or the pipe insulation and the building structure or equipment.

10.7.3.2 Spring hangers should be checked to insure that their load/travel indicators are approximately in their hot position setting and that the pipe is at the proper elevation.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:24:22 2005

10.7.3.3 Restraint control devices should be checked to insure that their travel indicators are approximately at their hot position setting.

10.7.3.4 Line temperature and actual hot positions of the load/travel indicators on springs and restraint control devices should be noted and recorded in a permanent formal log. See Figure 2 for suggested form. Upon completion of the work, this log should be made available to the owner.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Substantive changes in this 1995 edition are "flagged" by parallel bars as shown on the margins of this paragraph. The specific detail of the change may be determined by comparing the material flagged with that in the previous edition.

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-104, 1995, with permission of the publisher, the Manufacturers Standardization Society.' WROUGHT COPPER SOLDER JOINT PRESSURE FITTINGS

1. SCOPE

This standard practice covers 1/8″ through 8″ straight and reducing size wrought copper solder joint seamless fittings, designed for use with copper water tube, ASTM B88 at pressures and temperatures shown in Table A1. The fittings in this standard practice have dimensions and ratings not covered in ASME/ANSI B16.22. Included in this standard practice are:

a) Pressure-temperature ratings
b) Abbreviations for end connections
c) Size and method of designating openings and fittings
d) Markings
e) Material
f) Dimensions and tolerances
g) Tests

2. PRESSURE-TEMPERATURE RATINGS

2.1 Rating of Fitting. Fittings manufactured to this standard practice shall have pressure-temperature ratings that are the lowest of either the calculated tube rating (2.2) or the rating of the joint (2.3).

2.2 Calculated Tube Rating. The calculated pressure-temperature rating for ASTM B88 Type "M" Copper Water Tube, annealed, calculated as follows:

$$P = \frac{2Stm}{D-0.8tm}$$

Where: P = working pressure at temperature, psi
S = allowable stress at temperature, psi (per ANSI/ASME B31.1 or ANSI/ASME B31.9)
tm = minimum wall thickness, in. (per ASTM B88)
D = tube outside diameter, in.(1)

NOTE(1) including worst case tolerance

2.3 Rating of Joint. The working pressure-temperature rating for a solder joint piping system is dependent not only on fitting and tube strength, but also on the composition of the solder used for the joint.

Pressure-temperature ratings for solder joints to the dimensions of Table 2 made with typical commercial solders, are given in Annex A.

3. ABBREVIATIONS

3.1 The following symbols are used to designate the type of fitting end:

Symbol	
C	Solder joint fittings end made to receive copper tube diameter (female)
FTG	Solder joint fitting end made to copper tube diameter (male)
F	Internal ANSI Standard Taper Pipe Thread (female) NPTI
M	External ANSI Standard Taper Pipe Thread (male) NPTE

4. SIZE

4.1 The size of the fittings shown in Table 2 correspond to standard water tube size as shown in ASTM B88, Specification for Seamless Copper Water Tube. The size of the threaded ends correspond to nominal pipe size.

4.2 Fittings are designated by the size of the openings in the sequence illustrated in Figure 1.

5. MARKING

5.1 Each fitting shall be permanently marked with the manufacturer's name or trademark in accordance with MSS SP-25. Marking may be omitted from any fitting where it may damage soldering surfaces.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:25:38 2005

6. MATERIAL

6.1 Fittings shall be made from Copper UNS nos. C10200, C12000, or C12200 for which allowable stresses are founded in ANSI/ASME B31.1 or B31.9.

6.2 Other coppers and copper alloys may be used provided they meet the chemical requirements of 84% minimum copper and 16% maximum zinc and provided the fittings produced from the copper materials meet all the mechanical and corrosion resistant properties for the end purposes of the fittings. The composition of the copper materials shall contain nothing which will inhibit joining to tube or to other fittings.

7. LAYING LENGTHS

Due to widely varying manufacturing processes, uniform laying length dimensions of fittings cannot be established. Consult the manufacturer for these dimensions.

8. INSPECTION TOLERANCE

8.1 Linear Dimensions. An inspection tolerance as shown in Table 1 shall be allowed on center-to-shoulder, center-to-center, center-to-threaded end, and shoulder-to-threaded end dimensions on all fittings having female solder (solder cup) ends, and on center-to-solder end and solder end-to-threaded end dimensions on all fittings having male solder (fitting) ends.

Coupling inspection limits for shoulder-to-shoulder and shoulder-to-end dimensions shall be double those shown in Table 1 except that the minus tolerance applied to dimension "L" shall not result in a dimension less than 0.06 inch.

8.2 Ovality. Maximum ovality shall not exceed 1% of the maximum diameters shown in Table 2. The average of the maximum and minimum diameters must be within the dimensions shown in the Table.

TABLE 1. INSPECTION TOLERANCE

Standard Water Tube and Thread Sizes	Tolerance, Plus or Minus, in.
⅛, ¼, ⅜[1]	0.05
½, ⅝, ¾	0.06
1, 1¼, 1½, 2	0.08
2½, 3, 3½	0.11
4 and 5	0.12
6 and 8	0.16

NOTE:
[1] ⅛ size is ¼ O.D. seamless copper tube for refrigeration service, etc., as listed in ASTM B280.

8.3 Minimum Wall Thickness. The average of the wall thickness shall not be less than the thickness shown in Table 2 and the wall at any given point shall not be less than 90% of the wall thickness shown in the table.

9. THREADED ENDS

9.1 Fitting threads shall be right-hand, conforming to ANSI/ASME B1.20.1, American National Standard for Pipe Threads, General Purpose (Inch). They shall be taper threads (NPT.)

9.2 Countersink or Chamfer. All internal threads shall be countersunk a distance not less than one-half the pitch of the thread at an angle of approximately 45 degrees with the axis of the thread, and all external threads shall be chamfered at an angle of 30 degrees to 45 degrees from the axis, for the purpose of easier entrance in making a joint and protection of the thread. Countersinking and chamfering shall be concentric with the threads.

The length of threads shall be measured to include the countersink or chamfer.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:25:39 2005

9.3 Threading Tolerances. Tapered pipe threads (NPT) shall be checked by use of working plug or ring gages in either standard or limit types. Gages shall be threaded on/in hand tight. The reference point for gaging internal product threads depends upon the chamfer diameter. When the internal chamfer diameter exceeds the major diameter of the internal thread, the reference point is the last thread scratch on the chamfer cone. Otherwise, when the internal chamfer diameter does not exceed the major diameter of the internal thread, the reference point is the end of the fitting. On the external thread it shall be flush with the end of the fitting.

Tolerance for an internal threaded end having an internal shoulder shall be from the gage reference point (notch) to one turn small. Tolerance for an internal threaded end without shoulder and for an external threaded end shall be from one turn small to one turn large.

0. DESIGN OF THREADED ENDS

The wrenching section of internal threaded ends shall be polygonal, and the wrenching section of external threaded ends shall be furnished with a polygon or flats, at the manufacturer's option.

11. ALIGNMENT

The maximum allowable deviation in the angular alignment of any opening shall be 0.06 in./ft. (0.5%).

12. TEST

When required, these fittings shall be tested with air at a gage pressure of 60 psi minimum while under water or at a hydrostatic gage pressure of 250 psi.

13. GAGING

13.1 Standard Gaging Method of Solder Joint Ends. The standard method of gaging the diameter tolerance for male and female ends shall be by the use of plain plug and ring gages designed to hold the product within the limits established in Table 2.

13.2 Optional Gaging Method of Solder Joint Ends. For gaging the diameter tolerance of male and female ends, the manufacturer may use direct reading instruments instead of ring and plug gages as specified in paragraph 13.1. When gaging the diameters of male and female ends, using direct reading instruments, refer to paragraph 8.2.

ANNEX A

STRENGTH OF SOLDER JOINTS

This Annex is an integral part of MSS Standard Practice SP-104 and is placed after the main text for convenience.

The maximum pressure-temperature ratings for solder joints made with copper tube and wrought copper and copper alloy pressure fittings, using representative commercial solders, are listed below.

TABLE A1. PRESSURE-TEMPERATURE RATINGS OF SOLDER JOINTS

Joining Material	Working Temperature	Maximum Working Gage Pressure (psi)			
	Degrees F	Size ⅛ thru 1[1]	Size 1¼ thru 2[1]	Size 2½ thru 4[1]	Size 5 thru 8[1]
50-50 Tin-Led Solder[2][5]	100	200	175	150	135
	150	150	125	100	90
	200	100	90	75	70
	250	85	75	50	45
95-5 Tin-Antimony Solder[3]	100	300	300	275	250
	150	275	250	225	200
	200	250	200	200	180
	250	200	175	150	135
Joining[4] Materials Melting at or above 1100° F	Pressure-temperature ratings consistent with the materials and procedures employed.				

[1] Standard Water tube sizes.

[2] ASTM B32 Alloy Grade 50A.

[3] ASTM B32 Alloy Grade 95TA.

[4] These joining materials are defined as "brazing alloys" by the American Welding Society.

[5] The Safe Drinking Water Act Amendment of 1986 prohibits any solder with a lead content in excess of 0.2% for use on potable water systems.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Any part of this standard may be quoted. Credit lines should read 'Extracted from MSS SP-106, 1990 (R 1996), with permission of the publisher, the Manufacturers Standardization Society.' CAST COPPER ALLOY FLANGES AND FLANGED FITTINGS CLASS 125, 150 AND 300

1. SCOPE

This standard practice covers cast copper alloy flanges and flanged fittings having dimensions, ratings and materials not included in ANSI B16.24. Specifically this standard includes the following:

1.1 Solder joint flanges when made of ASTM B62, UNS C83600, ASTM B584, UNS C83600, ASTM B584, UNS C83800 and ASTM B584, UNS C84400 for rating Class 125 and Class 150.

1.2 Threaded flanges and blind flanges when made of ASTM B584, UNS C83600, ASTM B584, UNS C83800 and ASTM B584, UNS C84400 for rating Class 150 and Class 300.

1.3 Flanged fittings when made of ASTM B584, UNS C83600, ASTM B584, UNS C83800, and ASTM B584, UNS C84400 for rating Class 150.

2. PRESSURE-TEMPERATURE RATINGS

2.1 Flanges or flanged fittings conforming to this Standard Practice shall have pressure-temperature ratings that are the lower of Table 5 or 6, as applicable, or Table 7. All ratings are the maximum allowable non-shock pressures at the tabulated service temperatures.

2.2 If the two flanges in a flanged joint do not have the same pressure-temperature rating because one or both is soldered, blind or threaded or made of another material, the rating of the joint at any temperature is the lower of the two flange ratings at that temperature.

2.3 The temperature shown for a corresponding pressure rating is the temperature of the pressure-containing shell of the flange or flanged fitting. In general, this temperature is the same as that of the contained fluid.

2.4 Ratings in this document apply to flanged joints which conform to the limitations on bolting in 6.2 or gaskets in 8.2.

3. GENERAL REQUIREMENTS

3.1 The ratings listed are based upon good practice for alignment and assembly. Use of the ratings for flanged joints not conforming with such practice is the sole responsibility of the user. Requirements for alignment and assembly of joints and considerations of leakage due to forces and moments developed in the connected piping or equipment are not covered in this Standard Practice.

4. SIZE

4.1 The "size" of the flanges shown in Table 1 correspond to "standard water tube size" as shown in the Standard Specification for Seamless Copper Water Tube, ASTM.B88.

4.2 The "size" of flanges and flanged fittings shown in Tables 2, 3 and 4 is identified by the corresponding "nominal pipe size."

4.3 Reducing fittings shall be designated by the size of the openings in their proper sequence as indicated in Figure 1.

5. REFERENCE STANDARDS

The following specifications, standards and standard practices incorporated in this Standard Practice by reference are:

SP-9-92	Spot Facing for Bronze, Iron and Steel Flanges
SP-25-93	Standard Marking System for Valves, Fittings, Flanges and Unions

R indicates year reaffirmed.

6. MATERIALS

6.1 Castings

Castings shall be produced to meet the requirements of ASTM B62, UNS C83600, ASTM B584, UNS C83600, UNS C83800 or UNS C84400. When castings produced from ASTM B584, UNS C83600 are required to meet the ASME Boiler and Pressure Vessel Code, the certification of all testing is mandatory as is the testing of each lot number.

6.2 Bolting

Bolting materials used with these flanges shall conform to one of the following paragraphs.

6.2.1 Steel Bolting. Carbon steel bolting conforming to ASTM A307 shall not be used below -20° F nor above 400° F. See also 8.2.

6.2.2 Nonferrous Boltings. The following nonferrous materials may be used within the temperature limitation stated. See also 8.2. Other materials having at least 40 ksi specified minimum yield strength may be considered.

7. DIMENSIONS

7.1 Interchangeability. Class 125 and Class 150 Cast Copper Alloy Flanges and Flanged Fittings are dimensionally interchangeable with American National Standard Class 125 Cast Iron Flanges (ANSI B16.1), with American National Standard Class 150 Steel and Alloy Flanges (ANSI B16.5), with Class 150 Copper Alloy Flanges (ANSI B16.24) and American National Standard Class 150 Ductile Iron Flanges (ANSI B16.42).

7.2 Class 300 Flanges are dimensionally interchangeable with American National Standard Class 250 Cast Iron Flanges (ANSI B16.1), with American National Standard Class 300 Steel and Alloy Flanges (ANSI B16.5), with Class 300 Copper Alloy Flanges (ANSI B16.24) and American National Standard Class 300 Ductile Iron Flanges (ANSI B16.42).

NOTE:
When used with steel, iron or ductile iron flanges or fittings the copper alloy pressure-temperature ratings shown in this standard should not be exceeded.

7.3 Flange bolt holes shall be in accordance with the dimensions shown in Tables 1, 2, and 3.

7.3.1 When flanges are integral with fittings, pairs of bolt holes shall straddle the center line.

7.4 Fitting Dimensions

7.4.1. Center-to-Face Dimensions

7.4.1.1 Side Outlet Fittings. Side outlet elbows and side outlet tees shall have all openings on intersecting center lines.

7.4.1.2 Elbows
The center-to-face dimensions for straight size 90 degree elbows, 90 degree long radius elbows, 45 degree elbows and side outlet 90 degree elbows are shown in Table 4.

Reducing 90 degree elbows and reducing side outlet 90 degree elbows shall have the same center-to-face dimensions as straight size fittings shown in Table 4, corresponding to the size of the largest opening.

Special degree elbows ranging from 1 to 45 degrees, inclusive, shall have the same center-to-face dimensions given for 45 degree elbows and those over 45 degrees and up to 90 degrees, inclusive, shall have the same center-to-face dimensions given for 90 degree elbows. The angle designation of an elbow is its deflection from straight line flow and is the angle between the flange faces.

7.4.1.3 Tees, Crosses and Laterals
The center-to-face dimensions for straight size tees, with or without side outlet, crosses and laterals are shown in Table 4.

Reducing tees, with or without side outlet, reducing crosses and reducing laterals shall have the same center-to-face dimensions as straight size fittings shown in Table 4, corresponding to the size of the largest opening. Tees, crosses and laterals, reducing on the run only, shall have the same center-to-face dimensions as straight size fittings shown in Table 4, corresponding to the size of the largest opening.

Tees reducing on both runs are generally known as bullhead tees and have the same center-to-face dimensions as straight size fittings corresponding to the size of the outlet.

7.4.1.4 True Y's. Center-to-face dimensions for straight size true Y's are shown in Table 4. Reducing sizes are considered special and should be made to suit conditions.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:10 2005

7.4.1.5 Reducers and Eccentric Reducers. The face-to-face dimensions for all combinations of reducers and eccentric reducers shall be the same as given in Table 4, for the larger opening.

7.4.1.6 Crosses and Lateral Reinforcement. Crosses and lateral (Y-branches) both straight and reducing shall be reinforced where necessary to compensate for inherent weakness in the shape of these fittings.

7.5 Spot Facing

All flanges covered by this Standard Practice shall have bearing surfaces for bolting which shall be parallel to the flange face within 1 degree. Any back facing or spot facing required to accomplish parallelism shall not reduce the flange thickness, "B" or "C" below the dimensions given in Tables 1, 2 and 3. Diameter of spot facing shall be in accordance with MSS SP-9. When cutting into the hub of a flange with back facing tools, the intersection shall have a radius of not less than 1/16 inch.

8. BOLTS, NUTS AND GASKETS

8.1 For Carbon Steel and Non-Ferrous Bolts, smaller than three-quarter inch, ANSI standard square heads or ANSI standard heavy hex heads (ANSI B18.2.1) and ANSI standard heavy hex nuts (ANSI/ASME B18.2.2) are recommended. For Carbon Steel and Non-Ferrous Bolts, three-quarter inch and larger, ANSI standard hex heads or heavy hex heads (ANSI B18.2.1) and ANSI standard hex nuts, or ANSI heavy hex nuts (ANSI/ASME B18.2.2) are recommended.

All bolts and nuts shall be threaded in accordance with ANSI Standard Unified Screw Threads, (ANSI B1.1), Coarse Thread Series, Class 2A and Class 2B.

8.2 Full faced gaskets extending to the flange edge are required. Metallic gaskets shall not be used.

If bolting material is Carbon Steel or Non-Ferrous, compressed sheet gaskets less than 0.12 in. thick should not be used.

9. FLANGE CONNECTIONS

9.1 All solder joint connections shall be to the dimensions shown in Table 1. These dimensions are the same as solder joint dimensions shown in ANSI B16.18.

9.2 The standard method of gaging the diameter tolerances for Female Ends shall be by the use of plain plug gages designed to hold the product within the limits established in Table 1.

9.3 Optional Gaging Method
When gaging the diameters of Female solder cup ends, using direct reading instruments, refer to Note (5) of Table 1.

9.4 All threaded flanges shall have an American National Standard taper pipe thread conforming to ANSI/ASME B1.20.1.

9.5 All threads shall be countersunk a distance not less than one-half the pitch of the thread at an angle of approximately 45 degrees with the axis of the thread, and all external threads shall be chamfered at an angle of 30 to 45 degrees from the axis, for the purpose of easier entrance in making a joint and for protection of the thread. Countersinking and chamfering shall be concentric with the threads.

9.6 The length of threads specified in all tables shall be measured to include the countersink or chamfer.

9.7 Tapered pipe threads (NPT) shall be checked by use of working plug gages, either standard or limit types. Gages shall be threaded in hand tight.

The reference point for gaging internal product threads depends upon the chamfer diameter. When the internal chamfer diameter exceeds the major diameter of the internal thread, the reference point is the last thread scratch on the chamfer cone. Otherwise, when the internal chamfer diameter does not exceed the major diameter of the internal thread, the reference point is the end of the flange.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:10 2005

10. ALIGNMENT

10.1 The maximum allowable deviation in the alignment of the inside diameter (female) of a solder joint end shall be 0.06 in. in one foot (0.5 percent).

10.2 The maximum allowable variation in the alignment of threads of threaded flanges shall be 0.06 in. per foot (0.5 percent).

11. FACING

11.1 Flanges covered herein shall have either a smooth or serrated face in accordance with MSS SP-6. Raised, male-and-female, and tongue and groove facings are not recommended. When copper alloy flanges are bolted to ductile iron or steel flanges which normally have raised faces, the raised faces should be removed.

12. TOLERANCES

12.1 Flange Thickness
Flange thickness at any point within the spot face area, as defined in MSS SP-9, shall not exceed the required minimum thickness, "B", or "C", by more than 0.12 in.

12.2 Wall Thickness
It is recognized that some variations are absolutely unavoidable in the making of patterns and castings. Equipment shall be designed to produce wall thickness given in the tables. Wall thickness shall not at any point be less than 90 percent of the thickness given in the tables.

12.3 Drilling

12.3.1 Bolt Circle diameter ±0.06 in.

12.3.2 Center-to-Center of adjacent bolt holes ±0.03 in.

12.4 Inside Diameter "I"

12.4.1 Nominal Sizes to 2" inclusive ±0.02 in.

12.4.2 Nominal Sizes 2-1/2" and larger ±.04 in.

12.5 Center-to-Face
The following tolerances shall be permitted on all center-to-contact surface dimensions of fittings:

Nominal Pipe Size	Plus or Minus
10 and smaller	0.03 in.
12	0.06 in

Tolerances for contact surface-to-contact surface dimensions shall be twice those given above. The largest opening in the fitting governs the tolerance to be applied to all openings.

13. MARKING

13.1 General

Except as modified herein, flanges shall be marked as required in MSS SP-25.

13.1.1 Name. The manufacturer's name or trademark shall be applied.

13.1.2 Rating Class. Numerals shall be applied giving the pressure rating class for which the product is designed.

13.1.3 Size. The nominal tube/pipe size shall be given.

13.1.4 The product shall be identified by the material alloy number, such as 836, 838 or 844.

14. TESTS

14.1 Hydrostatic tests of flanges are not required unless specified by the user.

14.2 All fittings shall be capable of withstanding, without showing leakage, the appropriate hydrostatic test pressure listing in Table 5 or 6. Each fitting shall be subjected to either a hydrostatic test at the appropriate pressure listed in Table 5 or 6 or a gas test at a minimum pressure of 80 psig.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:10 2005

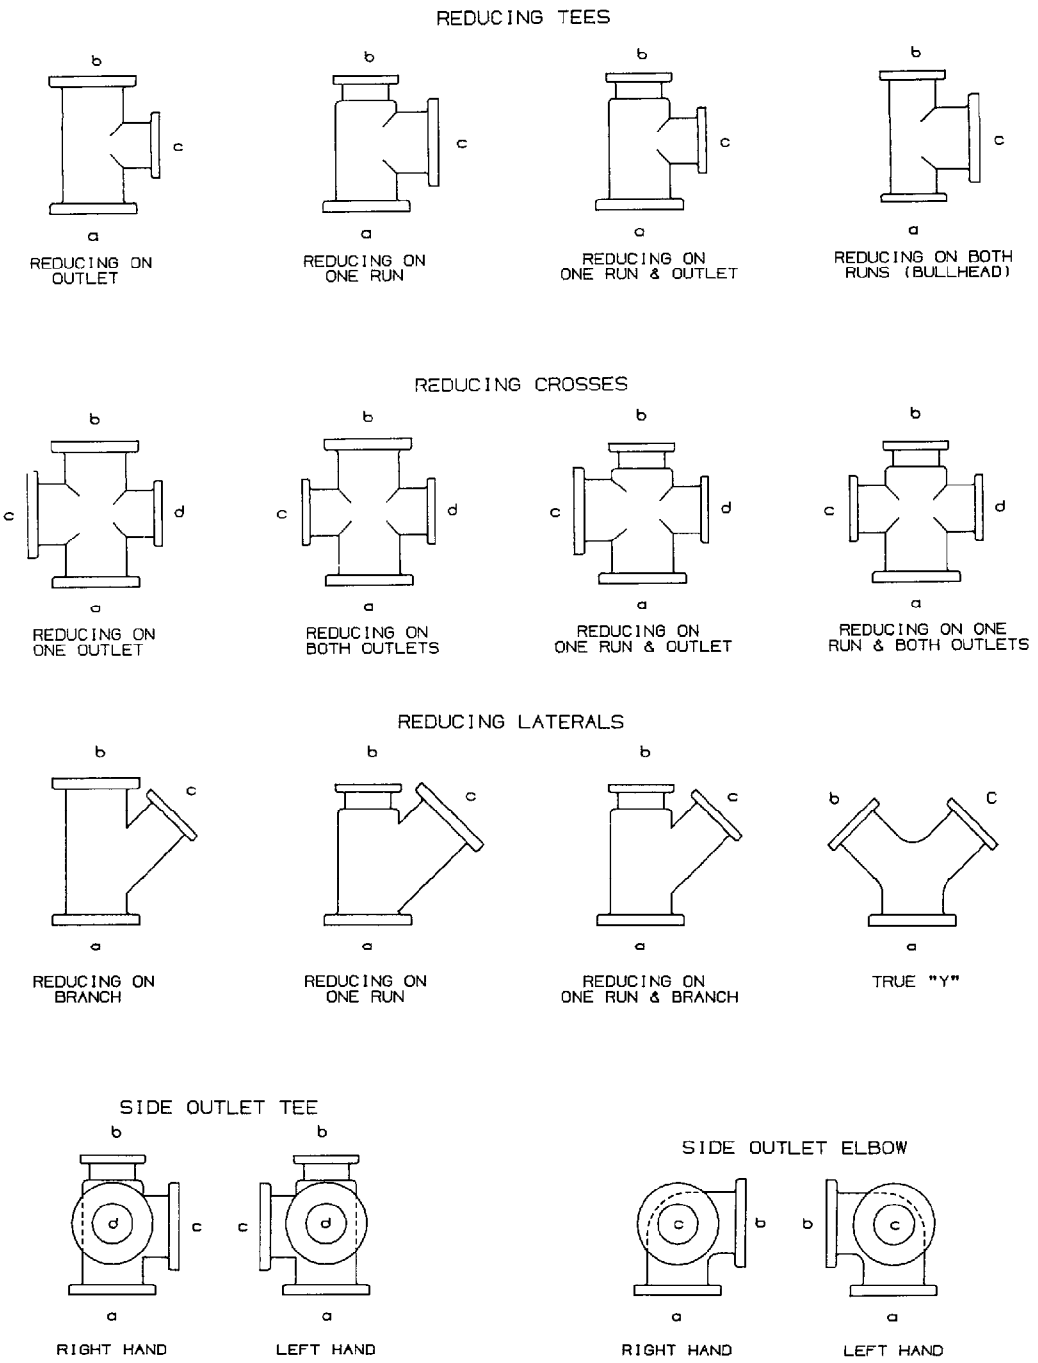

FIGURE 1. METHOD OF DESIGNATING OUTLETS OF REDUCING FITTINGS

In designating the openings of reducing fittings they should be read in the order indicated by the sequence of the letters a, b, c, and d. In designating the outlets of side outlet reducing fittings, the side outlet is named last and in the case of the cross which is not shown, the side outlet is designated by the letter e.

Note: The largest opening establishes the basic size of a reducing fitting. The largest opening is named first, except for bullhead tees which are reducing on both runs and for double branch elbows where both branches are reducing, the outlet is the largest opening and named last in both cases. (Double branch elbows are not included in this standard.)

STRENGTH OF SOLDER JOINTS

This table is an integral part of MSS SP-106 and is placed after the main text for convenience.

The maximum recommended pressure-temperature ratings for solder joints made with copper tube and cast copper alloy flanges using representative commercial solders, are listed in the table below.

TABLE 7. PRESSURE-TEMPERATURE LIMITATIONS

Joining Material	Working Temperature	Maximum Working Gage Pressure				
		Size ⅛ thru 1[1]	Size 1¼ thru 2[1]	Size 2½ thru 4[1]	Size 5 thru 8[1]	Size 10 and 12[1]
	°F	psi	psi	psi	psi	psi
50-50 Tin-Lead Solder[2] [5]	100	200	175	150	135	100
	150	150	125	100	90	70
	200	100	90	75	70	50
	250	85	75	50	45	40
95-5 Tin-Antimony Solder[3]	100	500	400	300	270	150
	150	400	350	275	250	150
	200	300	250	200	180	140
	250	200	175	150	135	110
Joining[4] Materials Melting at or above 1000°F	Pressure-temperature ratings consistent with the materials and procedures employed					

NOTES:

(1) Standard water tube sizes.
(2) ASTM B32 Alloy Grade 50A.
(3) ASTM B32 Alloy Grade 95TA.
(4) These joining materials are defined as brazing alloys by the American Welding Society.
(5) Consult local codes relating to the use of solders containing lead in excess of EPA guidelines for potable water systems. (Reference: Federal Safe Drinking Water Act, Amendment of 1986 - Public Law 99-339). This Act limits the maximum lead content to 0.2%.

This MSS Standard Practice was developed under the consensus of the MSS Technical Committee 108 and the MSS Coordinating Committee. The content of this Standard Practice is the result of the efforts of competent and concerned volunteers to provide an effective, clear, and non-exclusive specification that will benefit the industry as a whole. This MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Unless otherwise specifically noted in this MSS SP, any standard referred to herein is identified by the date of issue that was applicable to the referenced standard(s) at the date of issue of this MSS SP. (see Annex A).

In this Standard Practice all notes, annexes, tables, and figures are construed to be essential to the understanding of the message of the standard, and are considered part of the text unless noted as "supplemental". All appendices appearing in this document are construed as "supplemental". "Supplemental" information does not include mandatory requirements.

Substantive changes in this 2001 edition are "flagged" by parallel bars as shown on the margins of the affected text. The specific detail of the changes may be determined by comparing the material flagged with that in the previous edition.

Non-toleranced dimensions in this Standard Practice are nominal, and unless otherwise specified, shall be considered "for reference only".

Any part of this standard may be quoted. Credit lines should read "Extracted from MSS SP-114, 2001, with permission of the publisher, the Manufacturers Standardization Society." Reproduction prohibited under copyright convention unless written permission is granted by the Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.

FOREWORD

This document established a standard for corrosion resistant pipe fittings, threaded and socket-welding, Class 150 and 1000, produced for a number of years by various manufacturers to somewhat different dimensions although basically similar in principal. Users should note that corrosion resistant pipe fittings, threaded and socket-welding, Class 150 and 1000, furnished from existing stocks, until depleted, may have slightly different dimensions than shown herein.

This standard, orginally approved May 1995, was revised in 2001 to include Class 150 and 1000 square head plugs, hex head plugs and bushings, locknuts, and threaded and socket-welding unions.

CORROSION RESISTANT PIPE FITTINGS THREADED AND SOCKET WELDING CLASS 150 AND 1000

1. SCOPE

1.1 This Standard Practice for corrosion resistant pipe fittings, threaded and socket welding, Class 150 and 1000 establishes requirements for the following:

a) Pressure-temperature ratings
b) Size and method of designating openings of reducing fittings
c) Marking
d) Minimum requirements for materials
e) Dimensions and tolerances
f) Threading
g) Tests

2. PRESSURE-TEMPERATURE RATINGS

2.1 Pressure-temperature ratings for these fittings are shown in Table 1. Ratings are independent of the contained fluid and are the maximum allowable working pressures at the tabulated temperatures. Intermediate ratings may be obtained by linear interpolation between the temperatures shown.

2.2 The temperatures shown for the corresponding pressure rating shall be the material temperature of the pressure retaining structure. It is implied that the material temperature is the same as the fluid temperature. Use of a pressure rating at a material temperature other than that of the contained fluid is the responsibility of the user and subject to the requirements of any applicable code.

2.3 For purposes of this standard, castings are included for Class 150 fittings only.

2.4 The wall thickness of the fittings covered by this standard correspond to Schedule 40 pipe. When thinner pipe of equivalent material is used, its strength may govern the rating. When Schedule 40 pipe of equivalent material is used, the strength of the fitting governs the rating.

TABLE 1 - PRESSURE-TEMPERATURE RATINGS

Temperature (°F)	Class 150 (castings) PSIG	Class 1000 (Wrought) PSIG
-20 to 150	300	1000
200	265	910
250	225	825
300	185	735
350	150[a]	650
400	—	560
450	—	475
500	—	385
550	—	300

NOTE: [a]Permissible for service temperature up to 366 degrees Fahrenheit, reflecting the temperature of saturated steam at 150 psig.

3. SIZE

3.1 The size of the fittings listed in the following tables are identified by the corresponding nominal [b] pipe size (NPS).

NOTE: [b] the use of the word "nominal" as a modifier of a dimension or size is intended to indicate that the stated dimension or size is used for purposes of designation.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:50 2005

3.2 For reducing tees, crosses, and Y-branches (laterals), the size of the largest run opening shall be given first, followed by the size of the opening at the opposite end of the run. Where the fitting is a tee or Y-branch (lateral), the size of the outlet is given last. The straight line sketches of Fig.1 illustrate how the reducing fittings are read.

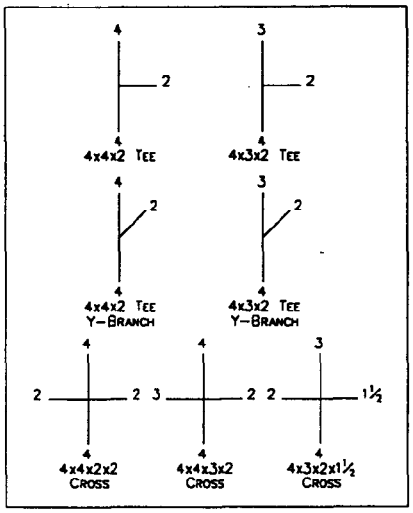

FIGURE 1 - IDENTIFICATION OF REDUCING FITTINGS

4. MARKING

4.1 ***Class 150 Fittings*** - Each Class 150 fitting shall be marked for identification with:

a) The manufacturer's name or trademark
b) Material identification
c) The symbol "SP114" to denote compliance with this standard
d) Class 150
e) Size
f) Other markings in accordance with MSS SP-25. Where size and shape of fittings do not permit all of the above markings, they may be omitted in the reverse order given.
g) The marking of plugs, bushings, and locknuts is not required by this standard.

4.2 ***Class 1000 Fittings*** - Each Class 1000 fitting shall be marked for identification with:

a) The manufacturer's name or trademark
b) Material identification
c) The symbol "SP114" to denote compliance with this standard
d) Class 1000 or 1M
e) Size
f) Other markings in accordance with MSS SP-25. Where size and shape of fittings do not permit all of the above markings, they may be omitted in the reverse order given.
g) The marking of plugs, bushings, and locknuts is not required by this standard.

5. MATERIAL

5.1 ***Castings*** - The chemical and mechanical properties of the castings shall be at least equal to the grades contained in ASTM A 351. Castings shall be heat treated by the solution annealing method specified in ASTM A 351. The castings shall be capable of passing the intergranular corrosion tests performed in accordance with practice B of ASTM A 262. The manufacturer shall be prepared to certify that the product has been so produced.

5.2 ***Wrought*** - Fittings, couplings, and caps shall be made from wrought forgings, seamless tubing, or bar stock. The chemical and mechanical properties shall be as a minimum equal to the grades contained in ASTM A 182, A 479 or A 511. Wrought material shall be heat

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:50 2005

treated by the solution method as specified in ASTM A 182, A 479, or A 511. The wrought material shall be capable of passing the intergranular corrosion tests performed in accordance with practice E of ASTM A 262. The manufacturer shall be prepared to certify that the product has been so produced.

6. DIMENSIONS AND TOLERANCES

6.1 ***General*** – The dimensions and tolerances of cast and wrought fittings are given in Tables 2 through 22.

6.2 ***Reducing Fittings*** - Reducing fittings shall have the same center-to-end dimensions and band diameter as the straight-size fittings corresponding to the largest size opening in the reducing fittings.

6.3 ***Tolerances*** - Unless otherwise noted, The dimensions in this standard are nominal and are subject to the designated manufacturing tolerances. The following tolerances apply:

a) ***Metal Thickness.*** Metal thickness at no point shall be less than 90% of the value given in Tables 3 through 10 and 12 through 22.

b) ***Center-to-End.*** Permitted center-to-end tolerances of fittings are shown in Table 2. Tolerances for end-to-end dimensions, lengths of couplings, and reducers shall be twice those given for center-to-end dimensions. The largest nominal pipe size in a reducing fitting governs the tolerance to be applied to all openings.

TABLE 2 - CENTER TO END TOLERANCES

NOMINAL PIPE SIZE	PLUS OR MINUS, IN.
1/8, ¼, 3/8	0.05
1/2, ¾	0.06
1, 1-1/4	0.07
1-1/2, 2	0.08
2-1/2, 3	0.10
4	0.12

7. THREADING

7.1 ***Types of Threads*** - All fittings, except locknuts, shall be threaded in accordance with ANSI/ASME B1.20.1, and shall have tapered threads. Locknut threads shall be NPSL straight pipe threads in accordance with ANSI/ASME B1.20.1.

7.2 ***Countersink or Chamfer*** - Internal threads shall be countersunk or chamfered a distance of not less than one half the pitch of the thread at an angle of approximately 45° with the axis of the thread, and external threads shall be chamfered at an angle of 30° to 45° with the axis, both for the purpose of easier entrance in making a joint and for protection of the thread. Countersinking and chamfering shall be concentric with the threads.

7.3 ***Thread Gaging***

7.3.1 ***External Threads*** - Variations in threading shall be limited to one turn large or one turn small from the gage face of the ring gage. The reference point for gaging shall be the end of the thread.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:26:50 2005

7.3.2 ***Internal Threads*** - Variations in threading shall be limited to one turn large or one turn small from the gaging notch of the plug gage. The reference point for gaging is the last thread scratch on the chamfer cone.

7.4 ***Length*** - The thread length specified in all tables shall be measured to include the countersink or chamfer.

7.5 ***Alignment*** - The maximum allowable variation in the alignment of threads of all openings of threaded fittings shall be 0.06 in./ft.

8. SOCKET-WELDING

8.1 Dimensions for socket-welding fittings shall conform to Tables 2, 7, 13, 17, and 22 and the general values given in Tables 3, 5, 6, 14, and 16.

8.2 The ends of socket-welding fittings shall be flat and at right angles to the socket axis and shall provide a minimum of 75% of the socket wall thickness for the fillet welding surface.

8.3 The socket bore shall be of uniform depth and diameter and exhibit a good workmanship finish that is free of burrs.

9. RIBS

9.1 ***General*** - The addition of ribs or lugs is permitted. Where ribs are used, it is recommended that their thickness shall be the same as specified for the metal thickness of the fitting.

10. PLUGS, BUSHINGS, AND LOCKNUTS

10.1 For dimensions of plugs, bushings, and lock nuts, see Tables 8, 9, 10, 11, 18, 19, and 20.

11.1 FACE BEVEL

11.1 A bevel not exceeding 5 degrees is permitted on the faces of threaded fitting openings. Center-to-end, end-to-end, and width of band dimensions may include or exclude the bevel.

12. WELDING

12.1 Installation welding requirements are outside the scope of this standard practice.

13. TESTING

13.1 Hydrostatic testing of fittings is not required by this standard. All fittings shall be capable of withstanding, without leakage or impairment of serviceability, a pressure equal to that listed in Table 1 at the – 20 to 150 F pressure rating for the applicable Class.

TABLE 11 - DIMENSIONS OF LOCKNUTS

Nominal Pipe Size	Nominal Thickness, Min. A	Width Across Flats		Diameter of Packing Recess (a) Min. F	Depth of Packing Recess (a) K
		Steel Min. (b) C	Cast Min. C		
1/8	0.19	0.69	....	0.50	0.04
1/4	0.25	0.84	....	0.66	0.06
3/8	0.28	1.00	....	0.77	0.06
1/2	0.31	1.18	....	0.97	0.06
3/4	0.34	1.43	....	1.23	0.06
1	0.38	1.75	....	1.50	0.06
1 1/4	0.42	2.10	....	1.86	0.06
1 1/2	0.47	2.35	....	2.12	0.06
2	0.53	2.88	....	2.63	0.09
2 1/2	0.59	3.50	3.86	3.18	0.09
3	0.67	4.27	4.62	3.84	0.09
4	0.80	5.38	5.79	5.00	0.13

GENERAL NOTES: Dimensions are in inches. Threads shall be NPSL straight Pipe threads in accordance with ANSI/ ASME B1.20.1

(a) The packing recess is cast finish (not tool finish).

(b) Locknuts in these sizes may be made from bar stock, in which case dimension C may be 11/16, 7/8, 1, 1 3/16, and 1 7/16, in., respectively, in order to conform with regular hexagon bar stock sizes.

2 1/2	2.38	4.12	3.22	0.21	2.906/2.931	0.56
3	3.00	4.75	3.50	0.23	3.535/3.560	0.56
4	4.03	6.00	3.85	0.26	4.545/4.570	0.69

GENERAL NOTE: Dimensions are in inches.

(a) Forgings shall be designed to produce fittings of metal thickness (E) given in the table. Metal thickness at no point shall be less than 90% of values given in the table.

List of MSS Standard Practices
(Price List Available Upon Request)

Number	
SP-6-2001	Standard Finishes for Contact Faces of Pipe Flanges and Connecting-End Flanges of Valves and Fittings
SP-9-2001	Spot Facing for Bronze, Iron and Steel Flanges
SP-25-1998	Standard Marking System For Valves, Fittings, Flanges and Unions
SP-42-1999	Class 150 Corrosion Resistant Gate, Globe, Angle and Check Valves with Flanged and Butt Weld Ends
SP-43-1991	(R 01) Wrought Stainless Steel Butt-Welding Fittings
SP-44-1996	Steel Pipeline Flanges
SP-45-1998	Bypass and Drain Connections
SP-51-2000	Class 150LW Corrosion Resistant Cast Flanges and Flanged Fittings
SP-53-1999	Quality Standard for Steel Castings and Forgings for Valves. Flanges and Fittings and Other Piping Componets - Magnetic Particle Examination Method
SP-54-1999	Quality Standard for Steel Castings for Valves, Flanges, and Fittings and Other Piping Components - Radiographic Examination Method
SP-55-2001	Quality Standard for Steel Castings for Valves, Flanges, Fittings, and Other Piping Components - Visual Method for Evaluation of Surface Irregularities
SP-58-1993	Pipe Hangers and Supports - Materials, Design and Manufacture
SP-60-1999	Connecting Flange Joint Between Tapping Sleeves and Tapping Valves
SP-61-1999	Pressure Testing of Steel Valves
SP-65-1999	High Pressure Chemical Industry Flanges and Threaded Stubs for Use with Lens Gaskets
SP-67-1995	Butterfly Valves
SP-68-1997	High Pressure Butterfly Valves with Offset Design
SP-69-1996	Pipe Hangers and Supports - Selection and Application
SP-70-1998	Cast Iron Gate Valves, Flanged and Threaded Ends
SP-71-1997	Gray Iron Swing Check Valves, Flanged and Threaded Ends
SP-72-1999	Ball Valves with Flanged or Butt Welding Ends for General Service
SP-73-1991	(R 96) Brazing Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings
SP-75-1998	Specification for High Test Wrought Butt Welding Fittings
SP-77- 1995	(R 00) Guidelines for Pipe Support Contractual Relationships
SP-78-1998	Cast Iron Plug Valves, Flanged and Threaded Ends
SP-79-1999a	Socket-Welding Reducer Inserts
SP-80-1997	Bronze Gate, Globe, Angle and Check Valves
SP-81-2000	Stainless Steel, Bonnetless, Flanged, Knife Gate Valves
SP-82-1992	Valve Pressure Testing Methods
SP-83-1995	Class 3000 Steel Pipe Unions, Socket-Welding and Threaded
SP-85-1994	Cast Iron Globe & Angle Valves, Flanged and Threaded Ends
SP-86-1997	Guidelines for Metric Data in Standards for Valves, Flanges, Fittings and Actuators
SP-87-1991	(R 96) Factory-Made Butt-Welding Fittings for Class 1 Nuclear Piping Applications
SP-88-1993	(R 01) Diaphragm Valves
SP-89-1998	Pipe Hangars and Supports - Fabrication and Installation Practices
SP-90-2000	Guidelines on Terminology for Pipe Hangers and Supports
SP-91-1992	(R 96) Guidelines for Manual Operations of Valves
SP-92-1999	MSS Valve User Guide
SP-93-1999	Quality Standard for Steel Castings and Forgings for Valves, Flanges, and Fittings and Other Piping Components-Liquid Penetrant Examination Method
SP-94-1999	Quality Std for Ferritic and Martensitic Steel Castings for Valves, Flanges, and Fittings and Other Piping Components-Ultrasonic Examination Method
SP-95-2000	Swage(d) Nipples and Bull Plugs
SP-96-1996	Guidelines on Terminology for Valves and Fittings
SP-97-1995	Integrally Reinforced Forged Branch Outlet Fittings-Socket Welding, Threaded and Buttwelding Ends
SP-98-2001	Protective Coatings for the Interior of Valves, Hydrants, and Fittings
SP-99-1994	Instrument Valves
SP-100-1997	Qualification Requirements for Elastomer Diaphragms for Nuclear Diaphragm Type Valves
SP-101-1989	Part-Turn Valve Actuator Attachment-Flange and Driving Component Dimensions and Performance Characteristics
SP-102-1989	Multi-Turn Valve Actuator Attachment - Flange and Driving Component Dimensions and Performance Characteristics
SP-103-1995	(R 00) Wrought Copper and Copper Alloy Insert Fittings for Polybutylene Systems
SP-104-1995	Wrought Copper Solder Joint Pressure Fittings
SP-105-1996	Instrument Valves for Code Applications
SP-106-1990	(R 96) Cast Copper Alloy Flanges and Flanged Fittings, Class 125, 150 and 300
SP-107-1991	(R 00) Transition Union Fittings for Joining Metal and Plastic Products
SP-108-1996	Resilient-Seated Cast Iron-Eccentric Plug Valves
SP-109-1997	Welded Fabricated Copper Solder Joint Pressure Fittings
SP-110-1996	Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends
SP-111-2001	Gray-Iron and Ductile-Iron Tapping Sleeves
SP-112-1999	Quality Standard for Evaluation of Cast Surface Finishes - Visual and Tactile Method. This SP must be sold with a 10-surface, three dimensional Cast Surface Comparator, which is a necessary part of the Standard. Additional Comparators may be sold separately at $25.00 each. Same quantity discounts apply on total order.
SP-113-2001	Connecting Joint between Tapping Machines and Tapping Valves
SP-114-2001	Corrosion Resistant Pipe Fittings Threaded and Socket Welding, Class 150 and 1000
SP-115-1999	Excess Flow Valves for Natural Gas Service
SP-116-1996	Service Line Valves and Fittings for Drinking Water Systems
SP-117-1996	Bellows Seals for Globe and Gate Valves
SP-118-1996	Compact Steel Globe & Check Valves - Flanged, Flangeless, Threaded & Welding Ends (Chemical & Petroleum Refinery Service)
SP-119-1996	Belled End Socket Welding Fittings, Stainless Steel and Copper Nickel
SP-120-1997	Flexible Graphite Packing System for Rising Stem Steel Valves (Design Requirements)
SP-121-1997	Qualification Testing Methods for Stem Packing for Rising Stem Steel Valves
SP-122-1997	Plastic Industrial Ball Valves
SP-123-1998	Non-Ferrous Threaded and Solder-Joint Unions for Use With Copper Water Tube
SP-124-2001	Fabricated Tapping Sleeves
SP-125-2000	Gray Iron and Ductile Iron In-Line, Spring-Loaded, Center-Guided Check Valves
SP-126-2000	Steel In-Line Spring-Assisted Center Guided Check Valves
SP-127-2001	Bracing for Piping Systems Seismic-Wind-Dynamic Design, Selection, Application

(R YEAR) Indicates year standard reaffirmed without substantive changes

A large number of former MSS Practices have been approved by the ANSI or ANSI Standards, published by others. In order to maintain a single source of authoritative information, the MSS withdraws its Standard Practice in such cases.

An MSS Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an MSS Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law as applicable.

Non-toleranced dimensions in this Standard Practice are nominal, and unless otherwise specified, shall be considered "for reference only."

Unless otherwise specifically noted in this MSS SP, any standard referred to herein is identified by the date of issue that was applicable to the referenced standard(s) at the date of issue of this MSS SP. See Annex A.

Any part of this standard may be quoted. Credit lines should read, 'Extracted from MSS SP-119-1996, with permission of the publisher, the Manufacturers Standardization Society." STD.MSS SP-119-ENGL 1996 ■ 5770640 0500852 643 ■

FOREWORD

ASME B16.9 is the American Standard for steel butt-welding fittings and although not so stated, it is implied that its scope deals primarily with standard (Schedule 40) wall and heavier as it was developed for carbon steel and those grades of alloy steel piping that are selected for pressure and temperature considerations. In 1949 ASME approved standard B36.19 for Stainless Steel Pipe in which Schedule 10S was established. Schedule 5S pipe was recognized in the 1952 publication of B36.19. The companion fittings for Schedule 10S pipe used B16.9 shapes and proportions and were standardized by MSS SP-43 which was first published in 1950. In anticipation, the original 1950 edition of MSS SP-43 also standardized Schedule 5S fittings.

Since 1950 the use of lighter than standard wall stainless steel piping in new construction has become predominant. The reasons for this evolution include the rapid expansion of the process industries in the fields of chemicals, plastics, textiles, paper, etc.

Coincident with the greater utilization of light wall pipe and of more capable metal forming machinery, the need to reduce pipe assembly fabrication times brought about by world market competition led to the development of belled end socket welding fittings. As with the development of MSS SP-43, the shapes and proportions of B16.9 were reused for the belled end fitting bodies to the maximum extent possible.

In 1992 first work on belled end fittings for this standard included socket proportions, socket to fitting body transition geometry, fitting thickness, and the ability of U.S. industry to support manufacturing. Some of this work only standardized service proven relationships used in belled end fittings made for the pulp and paper industry without standards for over 20 years. In 1994 the U.S. Navy funded burst and fatigue testing prototype fittings in the first of a two-phase program. The second phase was for an increased thickness fitting and was never done. In 1995 mid-way through testing, the Navy directed that these belled end fittings be used on ship systems in new construction followed shortly thereafter by direction to use them on the repair of ship systems. The quality and configuration control of these fittings was done by an interim document, the requirements of which, with some improvements, are contained herein.

In keeping with recent trends wherein military procurement activities have been using more commercial material standards and because of recognized fabrication economies related to the use of these fittings, the U.S. Navy sponsored the writing of this Standard Practice in cooperation with fitting manufacturers.

This Standard Practice establishes dimensional uniformity for light wall belled end socket welding fitting designs qualified by burst and fatigue testing for both Military Service and Commercial Code Practice.

BELLED END SOCKET WELDING FITTINGS, STAINLESS STEEL AND COPPER NICKEL

1. SCOPE

1.1 This Standard covers 1/4 through NPS 12 stainless steel and copper-nickel belled end socket welding fittings, including dimensions, tolerances, materials, socket end details, heat treating and marking requirements for use with the following pipe standards:

a) ASME B36.19 (Sch 5S and 10S)

b) ASTM B 466

c) ASTM B 467

d) MIL-T-16420 (Class 50 and Class 200 tube)

2. REFERENCES

2.1 Standards and specifications adopted by reference in this standard are shown in Annex A, for convenience of identifying edition number, date and source of supply.

3. SPECIAL CONSIDERATIONS

3.1 Tees fabricated by welding a branch to an outlet extruded from the run are allowable and shall be designed and manufactured in accordance with ASME B31 Codes for Pressure Piping as pipe fabrications. Thermometer well tees shown herein are pipe fabrications with envelopes dimensionally standardized by this Standard Practice. Refer to Section 12 for Fabrication Alternatives.

3.2 Partial Compliance Fittings may be made to special dimensions — such as unlisted reducing tees, sizes — such as NPS 3½, shapes — such as a street end tee, tolerances, or of wrought materials other than those covered by this Standard Practice by agreement between the manufacturer and the purchaser. When such fittings meet all other stipulations of this Standard Practice, they shall be considered as being in partial compliance herewith, provided they are appropriately marked (see Paragraph 19.4).

3.3 Laterals, wyes, mitered elbows, and tees of notch and point or saddle weld constructions are not covered by this standard.

4. DEFINITIONS

4.1 Belled End Socket Welding Fittings are a family of relatively thin wall wrought fittings which extend the advantages of socket welded joints through the common sizes of thin walled pipes. In this Standard Practice, "wrought" is used to denote fittings formed from tubular or flat starting materials as opposed to those that are either forged or cast to their final shape or machined from forgings or castings.

4.2 CUNI is a notation representing copper nickel alloy.

4.3 Electro-Etch is an electro-chemical marking process which consists of an electrical power unit that delivers current to a marking head. The marking head is covered with a pad that has been saturated with any one of several electrolytes formulated for marking various metals. When the marking head touches the fitting, the current and electrolyte flow through a stencil resulting in the replacement of metallic ions with a metal oxide forming an etched mark.

4.4 Controlled Dot Peen is a mechanical process using a carbide stylus to create a controlled depth dot matrix impression in the metal being marked.

4.5 Manufacturer's Heat Identification Number traces the starting material to a heat number or a lot number.

4.6 Definition reference for symbols, abbreviations and other definitions may be found in MSS SP-96.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc

5. CLASSIFICATIONS

5.1 Fittings shall be one of three classes: MP, MARINE or CR. The classes are specified in Table 1 for ready reference. Fittings of Class MP shall be further subdivided into four subclasses, specifically: MP-S, MP-W, MP-WX and MP-WU, each reflecting unique manufacturing processes and inspection requirements. Class MARINE shall only apply to copper nickel fittings. Class CR shall only apply to stainless steel fittings.

5.2 Class MP or MARINE or CR shall be specified by the purchaser. If the purchaser does not define a MP subclass, any may be supplied by the manufacturer. Class CR fittings shall not be substituted for fittings marked MP, but Class MP may be substituted for Class CR.

6. PRESSURE RATINGS

6.1 The allowable pressure ratings for MP Class fittings designed in accordance with this Standard Practice shall be 87½% of those calculated for straight seamless pipe of minimum wall thickness and stress value in accordance with the rules established in the applicable sections of ASME B31, Codes for Pressure Piping. The pipe wall thickness, schedule or class and material type shall be that with which the fittings have been ordered to be used; their identity on the fittings is in lieu of pressure rating markings.

6.2 The allowable pressure ratings for MARINE class fittings shall be the same as those for MIL-T-16420 Class 200 tube.

6.3 The allowable pressure ratings for CR class fittings shall be the same as those listed for CR class fittings in MSS SP-43 for materials listed therein.

6.4 The pipe fitting manufacturer certifies that his pipe fitting complies with this Standard Practice when his name or trademark is marked on the body of the fitting.

7. FITTING DESIGN

7.1 The designs of MP Class fittings are qualified simultaneously with the qualifications of manufacturing methods for each fitting design and those qualifications shall be by proof test (see Paragraph 8).

8. FITTING DESIGN AND MANUFACTURING METHOD PROOF TESTING

8.1 The validity of each unique manufacturing method used to make each type of MP and MARINE Class fitting shall be affirmed by pressure testing in accordance with applicable sections herein.

8.2 Unique manufacturing methods are determined by the following attributes:

a) Fittings formed from tubular sections are unique from those formed directly from flat material, irrespective of whether such sections are seamless or welded construction.

b) Fittings formed employing one fabrication weld are unique from those employing two fabrication welds.

c) Fittings formed from a greater or lesser number of pieces are unique.

8.3 Retesting shall be required for any change in manufacturing method which directly affects the tested component in a way which could reasonably be concluded to reduce either pressure containment or fatigue performance. Examples include a localized reduction in fitting thickness or a localized decrease in surface curvature radius.

8.4 Fitting types include long radius elbows, short radius elbows, tees, reducing tees, concentric reducers, eccentric reducers, caps and couplings.

8.5 For each fitting type and unique method of manufacture, the pressure test of one NPS size

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:27:51 2005

qualifies fitting sizes from one half to twice the NPS size tested. Further, tests performed on 90° long radius elbows qualify 45° elbows. Tests performed on a straight tee qualify reducing tees. Tests performed on eccentric reducers qualify concentric reducers. Tests performed on short couplings qualify long couplings and vice versa.

8.6 Pressure test results shall be kept on file by the fitting manufacturer and shall be made available to the purchaser upon request.

8.7 Preparatory to pressure testing, straight pieces of pipe shall be welded on to the end of each fitting and these pieces shall be capped. The pipe pieces shall be no shorter than twice the pipe outside diameter. The pipe shall be of the same material as the fitting.

8.8 Hydrostatic pressure shall be applied until the fitting or pipe ruptures. The test pressure prior to rupture shall be at least equal to 105% of the minimum manufacturing proof test pressure defined as follows:

$P = 2St/D$, where:

S = Actual material tensile strength determined from a specimen representative of the test fitting in the same stress relieving heat treat condition,

t = Minimum allowable pipe wall thickness,

D = Specified outside pipe diameter, and

P = Minimum manufacturing proof test pressure.

9. PRODUCTION TESTING

9.1 Hydrostatic testing of fittings is not required in this standard; however, each fitting of either class MP or MARINE shall be capable of withstanding without failure, leakage or impairment of serviceability, a test pressure equal to that prescribed for the specified matching pipe of equivalent material and minimum wall thickness. Class CR fittings shall be capable of withstanding a hydrostatic test pressure equal to one and one-half times the pressure ratings listed in MSS SP-43 for class CR fittings.

10. SIZES

10.1 The sizes of fittings, excepting only short radius elbows and thermometer well tees shall be from NPS 1/4 through NPS 12. Short radius elbows shall be from NPS 1 through NPS 12. Thermometer well tees shall have a body size of no larger than NPS 2.

10.2 All combinations of reducing tees listed in ASME B16.9 are available from manufacturers, however the following sizing standard is established in the Tables herein and is encouraged in practice:

a) For reducing run tees: Use a standard tee with street reducer.

b) For reducing branch tees in sizes NPS 2 and smaller: Use straight size tees and a street reducer.

c) For reducing branch tees in sizes larger than NPS 2: Use straight size or half size reducing branch tees with street reducers to create all other combinations.

11. MATERIALS

11.1 Stainless steel fittings shall be made from tubular or flat starting material, or a combination of both, the chemical composition and mechanical properties of which conform to ASTM A 240, ASTM A 312, or ASTM A 358.

11.2 Copper nickel fittings shall be made from tubular or flat starting material, or a combination of both. Tubular starting material shall conform to the chemical composition and mechanical properties of Military Specification MIL-T-16420, or ASTM Designation B 466 or B 467. Sheet starting material shall conform to MIL-C-15726 or ASTM Designation B 122.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:27:51 2005

12. FABRICATION ALTERNATIVES

12.1 Fabrications from Fittings: Stainless steel fittings may be fabricated from ASME B16.9 fittings wrought to class WP or from MSS SP-43 fittings wrought to CR requirements per ASTM A 403 on to which tangent ends have been butt welded. The tangent ends may be either street or bell and belling may be done either before or after attachment.

12.2 Branch Fabrications: Thermometer well tees and other tees utilizing extruded branch connections shall be fabricated in accordance with ASME B31 Code requirements for extruded outlets. The nominal pipe size of the bodies of thermometer well tee fittings shall not exceed NPS 2.

13. WELD DESIGN, INSPECTIONS AND REPAIR

13.1 Weld Design and Crown: Welds shall be made with a full penetration butt joint. The crowns of the welds shall rise no more than 1/16 inch above the fitting surface on the inside or on the outside. Permanent backing straps shall not be used. Fittings fabricated from half shells which are longitudinally welded shall have the interior and exterior crowns of the longitudinal welds removed for a distance of the socket and tne transition prior to the belling operation.

13.2 Weld Inspections

a) Fitting weld inspection requirements and starting material weld inspection requirements are specified in Table 1.

b) When required (see Table 1), welds shall be radiographically examined throughout their entire length in accordance with Paragraph UW-51 of Section VIII, Division I of the ASME Boiler and Pressure Vessel Code.

c) When required (see Table 1), welds shall be ultrasonically examined throughout their entire length in accordance with Appendix 12 of Section VIII, Division I of the ASME Boiler and Pressure Vessel Code.

d) When required (see Table 1), welds shall be liquid dye-penetrant inspected in accordance with S9074-AR-GIB-010/278.

13.3 Weld Repair: Weld repair is permitted only to longitudinal welds joining half shells or circumferential welds joining tangents to fittings. Repaired fittings shall be re-examined and re-heat treated. No other repairs by welding are permitted.

14. TOLERANCES AND DIMENSIONS

14.1 Tolerances are specified in Table 2.

14.2 Dimensions for sockets and fittings are specified in Tables 3 through 13.

14.3 Distances shown in the fitting sketches from the center of fittings to a pipe piece are pipe fabrication assembly design dimensions, thus are not assigned fitting manufacturing tolerances.

14.4 Squareness, off angle and off plane tolerances are as follows:

NPS range	Tolerance, +/- inches
1/4 to 1 1/2	1/16
2 to 6	1/8
6 to 12	3/16

15. SOCKET AND COUPLING END FACES

15.1 The socket end and coupling end faces shall be flat and perpendicular to the socket and coupling axes. The end face serves as a guide for pipe joint fillet weld thickness.

15.2 The socket end face shall be of a thickness no less than the minimum wall thickness specified in Table 2. The coupling end face shall be of a thickness no less than 1.09 times the minimum wall thickness specified in Table 2.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:27:51 2005

15.3 The choice of materials and/or the forming process may produce a heavy end face thickness. The maximum thickness at the welding face shall not exceed 1.5 times the thickness values specified in Table 2. A chamfer not exceeding 15 degrees from the fitting axis is permitted on the outside diameter to achieve thickness requirements.

16. PIPE JOINT FILLET WELD

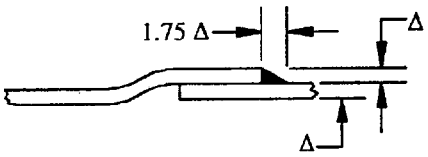

FIGURE 1 — JOINT FILLET WELD

16.1 Optimum fitting to pipe joint fatigue performance is attained when the height of the joint fillet is equal to the fitting socket face thickness (Δ) and extends 1.75 times that distance along the length of the pipe as shown in Figure 1. The slope of the weld face when measured from the pipe surface should be approximately 30 degrees.

17. FINISH

17.1 Fittings supplied under this Standard Practice shall be examined visually. Surface discontinuities shall be explored for depth. Surface discontinuities deeper than 5% of the minimum wall thickness or surface checks (fish scale) deeper than 1/64 inch (0.4 mm) or mechanical marks deeper than 1/16 inch (1.6 mm) shall be removed by machining or grinding to sound metal and the repaired areas shall be well faired. When the removal of a surface discontinuity reduces the wall thickness below the minimum wall limits, the fitting shall be rejected.

17.2 Stainless steel surfaces shall be free of scale and cleaned to ensure corrosion resistance. CUNI surfaces shall be free of black oxide.

18. HEAT TREATMENT

18.1 Each fitting shall be heat treated after completion of all welding or fitting body forming operations except that the forming of socket ends of fittings may be performed either prior to or after final heat treatment.

18.2 All stainless steel fittings shall be furnished heat-treated except as allowed in 18.1. The heat-treat procedure, except for those grades listed below, shall consist of solution annealing the fittings a minimum temperature of 1900°F (1040°C) until the chromium carbides go into solution, and then cooling at a sufficient rate to prevent re-precipitation. Grades 321H, 347H and 348H shall be solution annealed at 1925°F (1050°C) minimum. S31254 shall be solution annealed at 2100°F (1150°C) minimum. S33228 shall be solution annealed at 2050°F (1120°C) minimum. S34565 shall be solution annealed in the range 2050° F (1120° C) to 2140° F (1170° C). The maximum temperature for solution annealing grades 321, 321H, 347 and 347H shall be 2100°F (1150°C).

18.3 All copper nickel fittings shall be heat treated except as allowed in 18.1. Heat treating shall be performed at 1300 +/- 50°F for one hour at temperature per inch of thickness.

19. MARKING

19.1 All fittings shall be permanently marked by electro-etch, controlled dot peen or engraving pencil. The electrolyte shall not contain harmful amounts of chlorides, metals or metallic salts, such as zinc or copper, that would cause corrosive attack on heating. No metal impression stamps shall be used.

19.2 All fittings shall be marked with the prescribed information in accordance with MSS SP-25.

Copyright by the Manufacturers Standardization Society Of The Valve And Fittings Industry Inc
Wed Feb 02 02:27:52 2005

19.3 Tangent ends of different heat numbers shall be additionally marked.

19.4 Partial compliance fittings shall be identified by use of the suffix-PC.

19.5 The prescribed information shall be as follows:

a) Manufacturer's Name or Trademark

b) NPS Size

c) Wall thickness, Schedule or Class designation

d) Material Grade Identification Symbol

e) Method of Manufacture — The Method of Manufacture shall be described by the fitting class specified in Table 1

f) MSS SP-119 and Manufacturer's Heat Identification Number

g) Date of Manufacture, month and year

19.6 The following are examples of fitting markings:

(CUNI fitting)
Manufacturer
NPS 6 Class 200
MARINE 90/10 CUNI
MSS-SP-119
MFR. HEAT #
7/96

(Stainless steel fitting)
Manufacturer
NPS 6 S10S
MP 304L-W
MSS-SP-119
MFR. HEAT #
7/96

(Partial compliance fitting)
Manufacturer
NPS 4 S10S
MP 316-WU-PC
MSS-SP-119
MFR. HEAT #
7/96

19.7 In those cases where the size of the fitting will not permit the complete marking, the size of the marking may be reduced. If complete marking is not possible, then lines of identification may be omitted in the following order:

a) Date of manufacture

b) Applicable MSS SP-119

c) NPS Size

d) Wall thickness Schedule or Class

19.8 Stainless steel fittings meeting the chemical and mechanical property requirements of ASTM Designation A 240, A 312 and/or A 358 for more than one class or grade may be marked with more than one class or grade designation, such as MP304/304L-S or MP304/304L/304N-W or MP304/304H-WX, etc.

TABLE 1 — FITTING CLASSES

CLASS AND SUBCLASS	MATERIAL	STARTING PRODUCT	FABRICATION PROCESS AND WELD INSPECTION DETAILS
MP-S	Stainless Steel	Seamless pipe or seamless sheet	Seamless fabrication. No weld inspection.
MP-W	Stainless Steel	Seamless or welded pipe or sheet	Welds made by the fitting manufacturer shall be radiographically examined or ultrasonically tested throughout. Welds in the starting material made with the use of filler metal shall be radiographically examined throughout. Welds in the starting material made without the use of filler metal shall not require radiographic examination.
MP-WX	Stainless Steel	Seamless or welded pipe or sheet	All welds made by either the fitting manufacturer or the starting material manufacturer shall be radiographically examined throughout.
MP-WU	Stainless Steel	Seamless or welded pipe or sheet	All welds made by either the fitting manufacturer or the starting material manufacturer shall be ultrasonically tested throughout.
MARINE	Copper Nickel	Seamless or welded pipe or seamless sheet	Seamless or welded fabrication. All welds made by the fitting manufacturer shall be made in accordance with the requirements of S9074-AR-GIB-010/278 for Class P-1 piping except that radiographic examination is not required.
CR	Stainless Steel	Seamless or welded pipe or sheet	Seamless or welded fabrication. Inspections unspecified.

TABLE 2 — TOLERANCES

Dimensions are in Inches

Nominal Pipe Size	Socket Depth B	Socket Inside Diameter	Center to End and End to End D,F, M,Q,R	Tangent T	Minimum Wall Thickness (a)	
					CUNI Class 200	Stainless Steel Schedule 10S
1/4	+.03 -.03	+.03 -0	+.03 -.03	+.03 -0	0.065	0.057
3/8					0.065	0.057
1/2					0.065	0.073
3/4					0.065	0.073
1					0.065	0.095
1 1/4					0.072	0.095
1 1/2					0.072	0.095
2		+.04 -0			0.083	0.095
2 1/2			+.06 -.06		0.083	0.105
3					0.095	0.105
4					0.109	0.105
5		+.05 -0			0.125	0.117
6				+.06 -0	0.134	0.117
8					0.151 (b)	0.130
10		+.06 -0			0.187	0.144
12					0.250	0.158

GENERAL NOTE: Street end outside diameter tolerances shall be the same as the pipe with which the fitting identifies.

(a) Multiply these values by 1.25 for short radius elbows.

(b) MIL-T-16420 K lists 0.151 for alloy 706 (90/10) and 0.148 for alloy 715 (70/30).

TABLE 3 — SOCKET DIMENSIONS

Dimensions are in Inches

NOMINAL PIPE SIZE	A (b)	B (c)	C (d)
1/4	0.62	0.38	0.55
3/8	0.62	0.38	0.68
1/2	0.75	0.38	0.85
3/4	0.75	0.38	1.06
1	0.81	0.44	1.32
1-1/4	1.00	0.50	1.67
1-1/2	1.12	0.62	1.91
2	1.12	0.62	2.38
2-1/2	1.50	0.81	2.88
3	1.50	0.81	3.51
4	1.62	0.88	4.51
5	1.75	1.00	5.57
6	1.81	1.06	6.63
8	2.19	1.31	8.63
10	2.50	1.50	10.76
12	2.62	1.62	12.76

(a) The maximum allowable offset between the fitting socket axis and the fitting body axis shall be the lesser of one quarter of the minimum socket wall thickness or .040 inches.

(b) Dimension A identifies the length of the transition and the socket.

(c) Dimension B specifies the socket depth.

(d) Dimension C specifies the socket inside diameter. The socket inside diameter shall be the average of the maximum and minimum inside diameters.

(e) Pipe piece cut lengths are 1/16 - 1/8 inch from the bottom of the socket to allow for expansion when welding.

(f) Any local/incidental forming discontinuities (tool marks) shall have a minimum radius of 0.06 inches while maintaining minimum wall thickness requirements.

(g) The changes in contour in the transition shall have a minimum radius of four times the socket wall thickness.

Standard
Recommended Practice

Electrical Isolation of Cathodically Protected Pipelines

This NACE International standard represents a consensus of those individual members who have reviewed this document, its scope, and provisions. Its acceptance does not in any respect preclude anyone, whether he has adopted the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not in conformance with this standard. Nothing contained in this NACE International standard is to be construed as granting any right, by implication or otherwise, to manufacture, sell, or use in connection with any method, apparatus, or product covered by Letters Patent, or as indemnifying or protecting anyone against liability for infringement of Letters Patent. This standard represents minimum requirements and should in no way be interpreted as a restriction on the use of better procedures or materials. Neither is this standard intended to apply in all cases relating to the subject. Unpredictable circumstances may negate the usefulness of this standard in specific instances. NACE International assumes no responsibility for the interpretation or use of this standard by other parties and accepts responsibility for only those official NACE International interpretations issued by NACE International in accordance with its governing procedures and policies which preclude the issuance of interpretations by individual volunteers.

Users of this NACE International standard are responsible for reviewing appropriate health, safety, environmental, and regulatory documents and for determining their applicability in relation to this standard prior to its use. This NACE International standard may not necessarily address all potential health and safety problems or environmental hazards associated with the use of materials, equipment, and/or operations detailed or referred to within this standard. Users of this NACE International standard are also responsible for establishing appropriate health, safety, and environmental protection practices, in consultation with appropriate regulatory authorities if necessary, to achieve compliance with any existing applicable regulatory requirements prior to the use of this standard.

CAUTIONARY NOTICE: NACE International standards are subject to periodic review, and may be revised or withdrawn at any time without prior notice. NACE International requires that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of initial publication. The user is cautioned to obtain the latest edition. Purchasers of NACE International standards may receive current information on all standards and other NACE International publications by contacting the NACE International Membership Services Department, P.O. Box 218340, Houston, Texas 77218-8340 (telephone +1 281/228-6200).

Foreword

This standard recommended practice is to be used in conjunction with the latest revisions of NACE Standards RP0169, "Control of External Corrosion on Underground or Submerged Metallic Piping Systems"; RP0675, "Control of Corrosion on Offshore Steel Pipelines"; and RP0177, "Mitigation of Alternating Current and Lightning Effects on Metallic Structures and Corrosion Control Systems."[1,2,3] Each of these standards refers to electrical isolation or isolation joints, but details are not provided. This standard, which was prepared to supplement those standards, provides engineers, designers, and technical personnel dealing with pipelines the necessary information to electrically isolate cathodically protected pipelines.

This standard was originally prepared in 1986 by NACE International Task Group T-10A-15 on Electrical Isolation of Cathodically Protected Pipelines, a component of Unit Committee T-10A on Cathodic Protection, and was issued by NACE under the auspices of Group Committee T-10 on Underground Corrosion Control. The standard was revised in 1997, the current issue.

In NACE standards, the terms *shall*, *must*, *should*, and *may* are used in accordance with the definitions of these terms in the *NACE Publications Style Manual*, 3rd ed., Paragraph 8.4.1.8. *Shall* and *must* are used to state mandatory requirements. *Should* is used to state that which is considered good and is recommended but is not absolutely mandatory. *May* is used to state that which is considered optional.

Section 1: General

1.1 This standard explains the importance of pipeline electrical isolation in achieving and maintaining adequate, reliable, and economical corrosion control. The standard outlines the types of devices used for isolation; precautions to be observed; and selection of devices based on pipeline characteristics, site, and contents. The standard describes isolating flanges, gaskets, sleeves, washers, joints, unions, couplings, and spools, and discusses materials for pipeline casing isolation. Installation, field testing, and maintenance of isolating devices are also included.

This standard describes the application of isolating devices intended only for cathodic protection purposes where voltages across the isolating device are 1 to 2 volts DC and the AC exposure does not exceed 15 volts rms.[4]

This standard does not discuss situations in which isolating devices are incorporated purely for safety reasons; in those situations, reference should be made to relevant electrical safety codes. Isolating devices shall not be used in enclosed areas where combustible atmospheres are likely to be present.

1.2 Isolation of cathodically protected pipelines is recommended to minimize current requirements, facilitate testing and troubleshooting, and improve current distribution.

Section 2: Need for Isolation

2.1 Cathodic protection current intended for a given pipeline can flow to other underground facilities or equipment electrically connected to the pipeline. If protection of the other underground facilities is not intended, significant cathodic protection current can be lost unless preventive measures are taken. Generally called a current drain, this current loss can be reduced through electrical isolation of the pipeline.

2.2 Cathodic protection even of well-coated pipelines may not be economical or practical unless electrical isolation is achieved.

2.3 Pipeline casings should be electrically isolated from the carrier pipe.

2.4 If a pipeline passes through the wall of a valve pit or a building, metallic contact can occur between the pipe and the steel reinforcement in the concrete, causing a significant loss of protective current.

2.5 Electrical isolation can minimize or eliminate galvanic corrosion caused by dissimilar metals in contact with each other or caused by similar metals in contact with each other when one metal is bare or has a dielectric coating system while the other has a permeable (e.g., concrete or mortar) coating system.

2.6 If a pipeline is designed to be electrically continuous but is supported by another metallic structure in contact with soil or groundwater, the pipeline should be isolated from that structure. The isolating supports must prevent damage to the pipeline coating and must accommodate relative movement, vibrations, and temperature differentials.

2.7 Isolation of power and instrumentation grounding systems may be required where electrically operated valves and similar components form part of a pipeline system. All applicable safety codes and standards must be followed.

2.8 If a pipeline is to be protected by more than one type of cathodic protection system, isolation of one or more sections may be desirable.

2.9 Isolation of pipelines can be beneficial in controlling or limiting the effect of stray currents such as telluric currents, currents associated with an electric traction system, or currents from nearby structures under cathodic protection.

Section 3: Methods of Isolation

3.1 Electrically isolating devices may be specially manufactured or prefabricated. It may be possible for existing fittings to be retrofitted with isolating materials to serve as isolating devices. Selection of the type of isolating device depends on the mechanical forces due to its position in the system, the operating temperature range, pressure constraints, and other considerations. Provisions should be made for the connection of test cables for testing these isolating devices.

3.2 Flanges

3.2.1 A bolted pair of pipeline flanges may be converted into an electrically isolating device by

Copyright by the NACE INTERNATIONAL
Wed Feb 02 02:28:55 2005

inserting an isolating gasket between the flanges and isolating sleeves over the shanks of the bolts, and placing isolating washers under the external steel washers to isolate the bolts (see Figures 1a and 1b). Isolating gaskets may have diameters equal to or greater than the outside diameter of the flanges, or they may fit within the bolt circle of the flange faces or into the groove of ring-type joint flanges. Isolating sleeves (around bolts) and washers (over bolts and under nuts and bolt heads) may also be combined as one-piece units. In some underground applications, the nuts and bolts may be isolated from one flange only so that cathodic protection will also protect all bolts and nuts. In some applications, isolating flanges are required to be pressure tested after assembly. When isolating flanges are being considered for use below ground, special consideration should be given to the installation (see Paragraph 7.2.5). Should circumstances indicate that this type of installation would not be effective, an alternative device should be used.

3.3 Prefabricated Isolating Joints

3.3.1 Specially manufactured isolating joints should be available with pressure and electrical test certificates. Unless the isolating device is pressure tested as part of the pipeline system, a pressure test certificate may be required in order to comply with applicable codes. These codes include Parts 192 and 195 of U.S. Department of Transportation[1] Regulations, "Protection Against Accidental Overpressure," ANSI[2] B31.3, "Chemical Plant and Petroleum Refinery Piping," ANSI B31.4, "Liquid Transportation Systems for Hydrocarbons, Liquid Petroleum Gas, Anhydrous Ammonia, and Alcohols," and ANSI B31.8, "Gas Transmission and Distribution Piping Systems."[5-8]

3.3.2 Isolating monolithic joints for pressure services over 1,000 kPa[3] (150 psi) (see Figure 2) consist of a pair of hubs on short pipe lengths; one hub is extended at its periphery by a barrel that overlaps the other hub. The two sections are aligned with the isolating materials and held in position with a large compressive force that is locked by welding, wedging, or swaging and is pressure-sealed. These units do not include any threaded components and cannot be disassembled on site.

3.3.3 Isolating monolithic joints for pressure services below 1,000 kPa (150 psi) are generally one of two types. One type consists of short lengths of pipe. The end of one length is enlarged and its internal surface serrated. An isolating sleeve bonded to the external serrated surface of the other pipe fits into the enlarged pipe, which is swaged to hold the assembly in position. The second type (see Figure 3) is similar to the higher pressure joint described in Paragraph 3.3.2.

3.3.4 Isolating yoke-type joints (see Figure 4) include two hub assemblies. The back of one hub is conical. The two hubs are sealed using O-rings and isolating rings or spacers. The hubs are held together under pressure by an encircling yoke clamped by bolts through lugs that are normally tack welded.

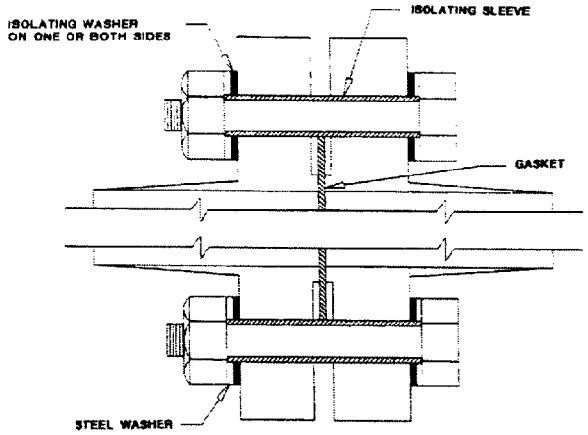

Figure 1a
This figure shows the use of full-length bolt sleeves.

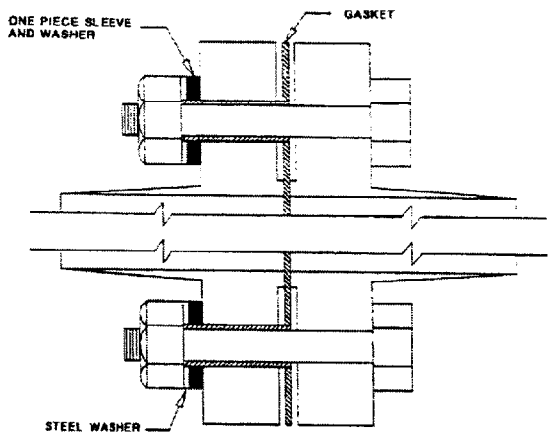

Figure 1b
This figure shows the use of one-half-length bolt sleeves.

3.3.5 Prefabricated isolating flanges are factory-assembled isolating devices that are welded to a short pipe length with welded or screwed end preparations.

3.4 Unions (see Figure 5)

An isolating union consists of two flanged bodies screwed onto the end of each connecting pipe. One flanged end is externally threaded, and the joint is held in position by a nut that is electrically isolated from the other end. The pressure seal may be achieved by using a molded seal and/or a gasket between mating faces.

3.5 Spools (see Figure 6)

An isolating spool for pipelines carrying fluids may be made either by inserting a long piece of nonmetallic pipe into a piping system or by inserting a long piece of metallic pipe into the pipeline in combination with one or two of the devices described in Paragraphs 3.2 through 3.6. One of the isolating devices described in those paragraphs may also be used with an extended pipe length that has a high-electrical-resistance lining bonded to the isolating flange or joint and to the inside of the extended pipe length. When using this design, the extended length should also be the protected length.

3.6 Couplings (see Figure 7)

3.6.1 Bolted couplings consist of a cylindrical steel middle ring, two resilient gaskets, and steel follower rings connected by a set of steel trackhead bolts. Isolation may be provided by an isolating gasket under one of the follower rings and an isolating sleeve for one pipe end.

3.6.2 Screwed couplings consist of a forged steel or malleable iron body, an isolating gasket, two retainer cups, and two end nuts, with a combined isolating sleeve and end spacer provided for one pipe end.

3.6.3 A sleeved coupling with a hydraulic sealing system consists of a steel sleeve inside a pipe coupling with two isolating gaskets sealed by internal and external hydraulic pressure to the sleeve. The sleeve is equipped with an isolating gasket, an isolating sleeve, and an isolating pipe spacer.

3.7 Isolating Tapping Sleeve (see Figure 8)

3.7.1 An isolating tapping sleeve consists of a split sleeve installed over a pipe with the two halves connected by bolts and gaskets. One end of the fitting is equipped with isolating material.

3.8 Isolating Transition Fittings

3.8.1 Isolating transition fittings include a dielectric pipe fitting or a section of pipe or tubing that may be inserted in low-pressure pipeline systems.

Section 4: Isolation from Other Metallic Structures

4.1 Pipelines to be cathodically protected must be isolated from other metallic structures unless the cathodic protection system has incorporated sufficient current drain for other metallic structures.

4.1.1 Casings

4.1.1.1 Pipelines are commonly routed under roads and railways in steel casings. The casings are normally electrically isolated from the pipeline. Isolation is provided by isolating spacers located circumferentially around the pipe. After these isolators are placed at intervals along the carrier pipe, the pipe is inserted into the casing (see Figure 9). NOTE: Other methods, such as coating pipes with concrete, are also used for isolation. The effectiveness of methods other than isolating spacers should be evaluated on a case-by-case basis.

4.1.1.2 Electrical isolation of the casing and carrier pipe provided by the isolating spacers may be relied upon only as long as the carrier pipe remains physically separated from the casing pipe. Isolating spacers should be designed and spaced to withstand the loads caused by the movement of the carrier pipe under operational conditions.

4.1.1.3 The use of proper end-sealing and casing-filling methods can prevent possible contacts as well as the ingress of foreign substances.

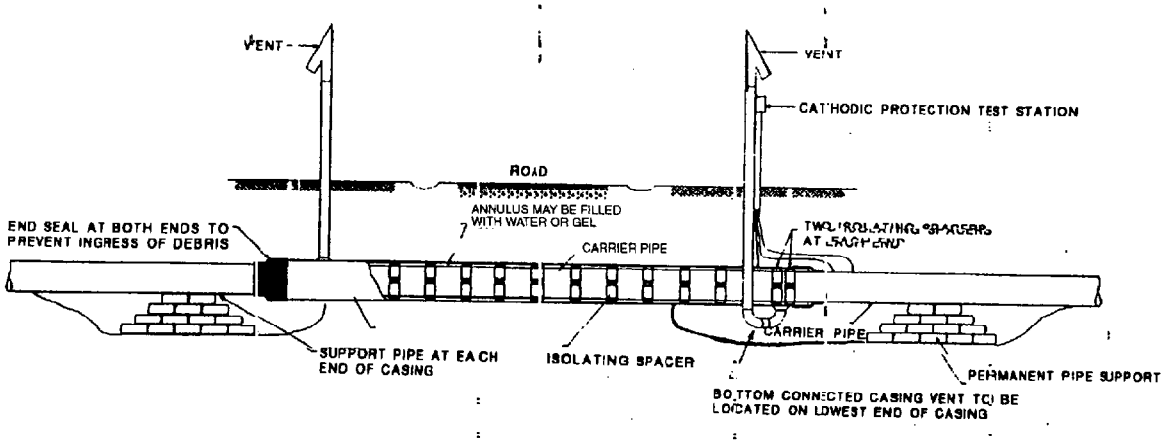

Figure 9
Typical Casing/Sleeve Installation

Wed Feb 02 02:28:57 2005

4.1.2 Pipe Bridges

4.1.2.1 Pipeline supports on a metallic pipe bridge shall be provided with pads to isolate the pipe electrically from the support cradles. Plastics, neoprene, fiberglass-reinforced plastic, or glazed ceramics may be used for these pads. The material chosen should be the most suitable for the pipeline service and environmental conditions.

4.1.2.2 If the cathodic protection system is designed so that the portion of the pipeline on the pipe bridge is isolated from the underground portion of the pipeline, a jumper wire can be bonded to the pipeline at the isolating device (see Figure 10) to provide electrical continuity around the isolated section on the bridge. The jumper wire must be sized to conduct the required cathodic protection current.

4.1.3 Pipeline Crossings

4.1.3.1 A minimum separation of 30 cm (12 in.) should be maintained between all buried metallic structures at pipeline crossings. Where this is not possible, consideration should be given to installation of isolating materials between the structures.

4.1.4 Offshore Platform Riser Pipes

4.1.4.1 Pipelines rising from the ocean bed onto offshore platforms may require electrical isolation from the structure's steel jacket, support legs, or, in the case of concrete platforms, the concrete-reinforcing steel. If the riser support is designed to allow movement of the riser pipe, then roller guides, flexible collars, or other suitable parts made of isolating materials can be used to ensure effective electrical isolation.

4.1.5 Electrical Grounds and Supply Cable Sheathing

4.1.5.1 Installation of electric motorized valves and instrumentation transducers in a pipeline connects the pipeline with the electrical supply earth grounding. Electrical isolation can be obtained by using one of the following methods. Any measure taken should not conflict with applicable electrical codes.

4.1.5.1.1 Install a continuity bond cable around the assembly; then provide isolating joints on each side of the valve.

4.1.5.1.2 Ground the valve with appropriate devices; then isolate the electrical supply earth grounding from the valve.

4.1.5.1.3 Separately ground and connect the secondary side of the circuit to approved isolating equipment; then isolate the electrical supply earth grounding from the motor by terminating the supply on an isolating transformer or equipment approved for that application.

4.1.5.1.4 Ground separately, if necessary; then isolate the instrumentation transducer screen from the transducer.

4.1.5.1.5 Connect an approved electrical equipment device; then connect the electrical supply earth grounding by that means.

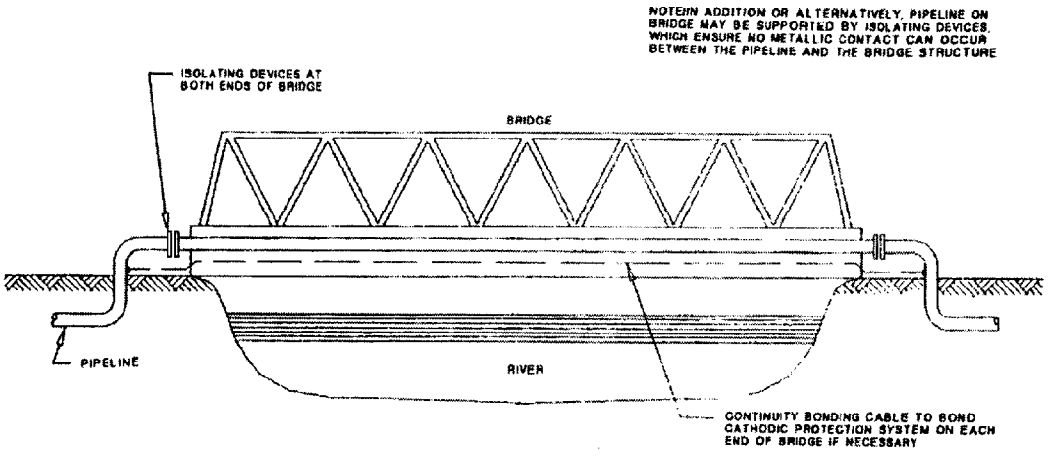

Figure 10

Section 5: Selection of Isolation Device or Method

5.1 The following factors should be carefully considered when selecting the isolating device or method to be used in any particular application.

5.1.1 Pipeline contents;

5.1.2 Pipeline temperature;

5.1.3 Pipeline pressure rating;

5.1.4 Location and orientation of isolating devices;

5.1.5 Piping configuration;

5.1.6 Isolation from foreign contact;

5.1.7 Necessity for field repair; and

5.1.8 Tensile, compression, and bending load requirements of the isolating devices;

Section 6: Equipment Specifications

6.1 This section defines the general requirements for materials for isolating devices and for the design and testing of isolating devices.

6.2 Isolating Flanges

6.2.1 Specifications - Material, design, manufacturing, testing, and marking specifications shall be agreed upon by the customer and the vendor and shall be based on recognized standards.

6.2.2 Procurement Information - The following information is normally required for purchasing:

6.2.2.1 Pipe nominal diameter and material;

6.2.2.2 Flange standard;

6.2.2.3 Pressure class;

6.2.2.4 Product carried;

6.2.2.5 Operating temperature range;

6.2.2.6 Wall thickness of pipe;

6.2.2.7 Flange dimensions, pitch circle diameter, bolt size, number of bolts, etc., if nonstandard;

6.2.2.8 Flange face details (e.g., raised or full face, ring joint);

6.2.2.9 Test requirements; and

6.2.2.10 Isolating materials.

6.2.3 Design

6.2.3.1 Gaskets may either be full face or may fit inside the bolt circle. They should be a minimum of 3.0 mm (120 mils) thick and may protrude into the bore of the pipe by 1.5 mm (60 mils) to prevent electrically conductive bridging over the isolation material. Thinner gaskets may be appropriate to reduce blowout potential.

6.2.3.2 Isolating bolt sleeves are normally designed for standard bolting in standard bolt holes and should be of sufficient length to extend halfway inside the steel washer. Care should be taken to ensure that the dimensions selected will allow the use of the standard-size bolt or one size smaller high-tensile-strength bolt.

6.2.3.3 Isolating bolt washers should be sized internally to accommodate the bolt sleeve, and the OD should be sized so that the washer will fit inside the flange spot facing.

6.2.3.4 Steel washers should be the same size as the isolating washer and should be treated to prevent corrosion.

6.2.3.5 A combined isolating sleeve/isolating washer may be used.

6.2.4 Materials

6.2.4.1 Gaskets should be manufactured from isolating material having low cold-flow characteristics, low water absorption, and high compressive strength. Preference should be given to materials with low *y* and *m* factors. The *y* factor is a measure of the compressive load required to establish an initial seal, while the *m* factor is an indication of the additional load required to hold the fluid pressure needed to keep the seal in operation. The smaller these factors are, the less pressure is required to establish and maintain the seal. (The *m* and *y* factors for various materials are included in the ASME[4]

[4] American Society of Mechanical Engineers (ASME), 345 E 47th St., New York, NY 10017-2392.

Boiler and Pressure Vessel Code, Section 8, ANSI B16.5, and BS 1560.[9,10,11]) For pipelines carrying water or water-containing fluids, gaskets may consist of a laminate core material faced with a suitable sealing material (e.g., neoprene-faced phenolic), or with seals set into the laminate core material. For cryogenics, the core should be a suitable epoxy with either polytetrafluoroethylene (PTFE) or fluorinated ethylene propylene (FEP) seals, depending on the product and temperature. For high-pressure, high-temperature steam, gasket manufacturers should be consulted. For pipelines carrying hydrocarbons and other fluids, the gasket selected should be suitable for the particular application (product, pressure, temperature, etc.). Gaskets should have the highest compressive strength suitable for the service conditions.

6.2.4.2 Isolating bolt sleeves should be manufactured from materials having low water absorption (because of the limitations on thickness), high dielectric strength, and low cold-flow characteristics. They should be suitable for the service conditions of the particular application.

6.2.4.3 Isolating washers should be manufactured from materials having high compressive strength, low water absorption, high dielectric strength, and low cold-flow characteristics.

6.2.4.4 All materials should be selected to suit the operating conditions (product, pressure, temperature, etc.). Special consideration should be given to ensuring that the materials selected for the isolating sleeves and washers are not damaged during tightening at the time of installation.

6.2.5 Testing - The materials used should be supplied with suitable test certificates, if required, stating the compressive strength, *m* and *y* factors, temperature rating, pressure rating, water absorption, and dielectric strength.

6.3 Other Devices

6.3.1 Specifications - Material, design, manufacturing, testing, and marking generally shall be based on recognized standards.

6.3.2 Procurement Information - The following information is normally required for purchasing:

6.3.2.1 Pressure class;

6.3.2.2 Service temperature range;

6.3.2.3 Product carried;

6.3.2.4 Grade of pipe material;

6.3.2.5 Pipe dimensions;

6.3.2.6 Mandatory design standards and any unusual or high external forces (e.g., tension, bending, torsion, or thermal forces);

6.3.2.7 Internal and external coating;

6.3.2.8 Overall length of device;

6.3.2.9 Test/inspection requirements; and

6.3.2.10 Packing requirements.

6.3.3 Design

6.3.3.1 The design shall be such that under maximum working conditions, stress in any metallic part of the device shall not exceed the specified minimum yield strength of that part.

6.3.3.2 The procedures used by manufacturers in final assembly shall ensure that the joint sealing does not allow leakage and that the joint seal is not damaged during fabrication or by testing conditions. Elastomer seals shall have permanent residual elasticity to ensure leak tightness.

6.3.4 Manufacture

6.3.4.1 The manufacturer shall be responsible for the integrity of the manufacturing procedures and conformance to the specifications provided by the customer.

6.3.4.2 The following information may be required by the customer:

6.3.4.2.1 General arrangement drawing and material safety data sheets;

6.3.4.2.2 Detailed drawings showing all parts with material identification and stress/design calculations;

6.3.4.2.3 Full details of the manufacturing procedure;

6.3.4.2.4 Fabrication details including welding and inspection procedures;

6.3.4.2.5 Installation and maintenance instructions; and

6.3.4.2.6 Material and test certification, etc.

6.3.5 Testing - The acceptance criteria shall be set in accordance with the requirements of the customer and of applicable codes.

Copyright by the NACE INTERNATIONAL
Wed Feb 02 02:28:57 2005

6.3.5.1 Prototype testing should be conducted to prove the integrity of the design and manufacturing procedures; alternatively, independently witnessed test data may be satisfactory. For most applications, the following tests are conducted:

6.3.5.1.1 Hydrostatic cyclic pressure test;

6.3.5.1.2 Hydrostatic pressure plus bending test;

6.3.5.1.3 Vacuum test, where appropriate; and

6.3.5.1.4 Torsional test.

6.3.5.2 Common acceptance tests to be conducted on each device are:

6.3.5.2.1 Hydrostatic pressure test;

6.3.5.2.2 Dielectric and resistance tests; and

6.3.5.2.3 Holiday test on coatings/linings.

6.3.6 Marking - Each device may be identified using marking methods approved by the customer. The information given to identify the device could be as follows:

6.3.6.1 Purchase order number;

6.3.6.2 Joint serial number;

6.3.6.3 Manufacturer's name;

6.3.6.4 Nominal diameter;

6.3.6.5 Specification number;

6.3.6.6 Maximum design pressure;

6.3.6.7 Test pressure; and

6.3.6.8 Temperature rating.

6.4 Casing Isolator Spacers and End Seals

6.4.1 All isolating materials must be selected for the long-term retention of their compressive strength, dielectric properties, and resistance to ambient conditions. The primary function of the casing isolator is to electrically isolate and support the carrier pipe in the casing and protect the pipeline coating. The carrier pipe should be fully supported within each end of the casing and externally to the casing at either end (see Figure 9).

6.4.1.1 Specifications for the casing isolator should provide the following information:

6.4.1.1.1 Width and thickness of the casing isolator;

6.4.1.1.2 Coating specifications for metallic components;

6.4.1.1.3 Dielectric material composition, physical characteristics, and compressive strength;

6.4.1.1.4 Number and spacing of isolating segments of casing isolator;

6.4.1.1.5 Carrier pipe insulator inner liner isolating material and dimensions; and

6.4.1.1.6 Attachment hardware.

6.4.2 Procurement Information - The following information is normally required for purchasing:

6.4.2.1 Actual carrier pipe outside diameter, including coating;

6.4.2.2 Casing inside diameter;

6.4.2.3 Bell or flange diameter (if applicable);

6.4.2.4 Clearance desired between the outside diameter of the pipe, including any flange, bells, or protective coatings, and the casing inside diameter;

6.4.2.5 Position within casing (standard, centered, or restrained);

6.4.2.6 Casing length and the weight per linear meter (foot) of the carrier pipe;

6.4.2.7 Weight of the fluid/product carried, and

6.4.2.8 Operating temperatures and environment.

6.4.3 Materials

6.4.3.1 The materials selected must be compatible with the carrier pipe coating, the environment, and all operating conditions. The thickness, spacing, and components of the casing isolator should be designed to prevent contact between the carrier pipe and the casing.

Section 7: Equipment Installation

7.1 This section discusses the procedures to be used when installing the equipment described in Section 3. The procedures are designed to ensure that:

7.1.1 A satisfactory degree of electrical isolation is achieved at the time of installation and that the joint is not damaged so as to cause an accelerated degradation rate with time;

7.1.2 The installed equipment is adequately protected against the effects of stray DC or induced AC voltages;

7.1.3 There is adequate provision for test leads to allow for field testing and maintenance (typical arrangements are shown in Figure 11); and

7.1.4 Electrical continuity is provided to all parts of bolted isolated couplings to ensure their inclusion in the cathodic protection system.

7.2 Installation

7.2.1 General - When installed, all equipment items should be properly supported and aligned so that any forces transferred from the adjoining pipe are minimized. This should be considered when equipment locations are selected. The equipment chosen must be suitable for the mechanical forces to be encountered at the selected site. Isolating devices should not be installed in gas systems at locations where the accumulation of internal moisture is likely. When feasible, the flanges and isolating devices should be assembled and tested before and after installation.

7.2.2 Monolithic Isolating Devices

7.2.2.1 Monolithic isolating devices may be supplied in a form suitable for welded, flanged, or threaded ends.

7.2.2.2 Monolithic isolating devices for welding should be ordered with the weld end preparation conforming to the main pipe-laying specifications. The manufacturer's special installation instructions must always be followed, particularly when welding joints with short overall lengths, to ensure that the heat generated does not damage the isolating materials used in the joint construction.

7.2.3 Yoke-Type Isolating Joints - These joints should be installed as described in Paragraph 7.2.1. Particular care should be taken in supporting the yoke joint and adjacent pipe to ensure that minimum strain is applied during welding and backfilling.

7.2.4 Isolating Spools (see Figure 6) - These joints must be installed as described in Paragraph 7.2.1. In the case of linings, additional care should be taken to ensure that the direction of the joint is correct. The side of the joint that has the longer length of internal lining must be attached to the protected side of the pipeline. Linings must be fused or bonded to the internal surface of the pipe.

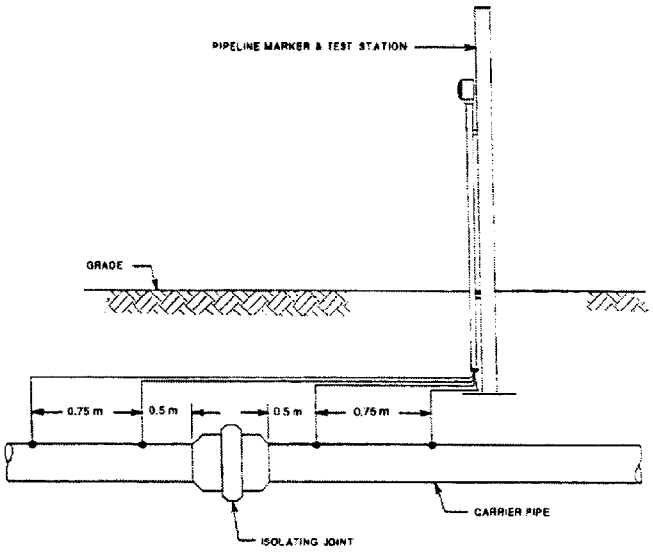

Figure 11
Isolating Joint Test Station

Copyright by the NACE INTERNATIONAL
Wed Feb 02 02:28:58 2005

7.2.5 Isolating Flange Joints

7.2.5.1 Factory Preassembled Joints - These are supplied with weld ends and should be installed as described in Paragraph 7.2.1.

7.2.5.2 Isolating Gasket Kits

7.2.5.2.1 Flanges are welded or screwed onto the pipeline, and the isolating gasket is supplied as a kit for on-site installation. Ideally, the installation should take place in clean, dry conditions. Flanges on which isolating gaskets are to be installed should be supplied as matched pairs or reamed on site to ensure correct alignment of bolt holes.

7.2.5.2.2 The flange faces should be clean and correctly aligned. Misaligned flanges will result in damage to the isolating sleeve during assembly or subsequent springing of the pipe. Flange faces should be square and free of burrs to allow for correct sealing of nuts, bolts, and washers.

7.2.5.2.3 The isolating gasket should be carefully aligned between the flange faces and the bolt holes. It may be easier to use one size smaller diameter, high-tensile-strength steel bolts, and/or special thin-walled sleeving to assist alignment.

7.2.5.2.4 Alignment pins should be inserted to ensure that flange alignment is maintained during installation of the isolating sleeves.

7.2.5.2.5 The isolating sleeves are then positioned in the correctly aligned holes. Isolating sleeves must be of the correct length. If they are too long, they may be damaged when the bolt nuts are finally tightened. If they are too short, they may fail to provide proper isolation. The length of the isolating sleeve shall normally include the two isolating washers, except where alignment allows only one flange to be isolated.

7.2.5.2.6 The bolts, complete with isolating washers adjacent to the flange and steel washers under the bolt and/or nut heads, are inserted through the sleeves and tightened by hand.

7.2.5.2.7 Final tightening to the tension recommended for the diameter and pressure rating of the flange shall be done in a sequence that provides for equal tension without distortion.

7.2.5.2.8 The original alignment pins may then be removed and bolts installed, complete with sleeves and washers as described above.

7.2.5.2.9 Before measures are taken to protect against the ingress of moisture, the effectiveness of the isolation achieved should be checked using appropriate methods.

7.2.5.3 Protection Against Ingress of External Moisture - The materials used for the isolating sleeves, washers, and gaskets may absorb water, and the construction of the joint may allow for moisture ingress, both of which reduce the electrical resistance of the assembly. Therefore, providing a protective coating is essential. A suitable material may be applied to fill in the crevices and gaps between flange faces and mold around the flange faces in underground installations. In this way, a smooth profile is achieved that may be coated or wrapped to the same standard as the pipeline, together with the adjacent pipe work.

7.2.6 Pipeline Casing Isolators

7.2.6.1 Pipeline casing isolators must be installed in accordance with the manufacturer's instructions. Special care should be taken to ensure that all subcomponents are correctly assembled and tightened and that no damage occurs during insertion of the carrier pipe.

7.2.6.2 The annulus between the carrier pipe and the casing should be sealed at each end of the casing to prevent electrolyte, debris, and the surrounding soil from entering the casing.

7.2.6.3 There must be no metallic contact between the casing and the carrier pipe. The spacing of isolators should ensure that the carrier pipe is adequately supported throughout its length, particularly at the ends, to prevent settling and possible shorting.

7.2.7 Pipeline Support Isolators - Care should be taken to ensure that isolating materials used in isolating supports are adequately secured so as to eliminate the possibility of dislodging, which would render the isolation ineffective.

7.3 High-Voltage Protection

7.3.1 Isolating devices and supports should be protected against damage from high-voltage surges. These surges may be caused by lightning, induced AC from adjacent or overhead high-voltage cables, fault conditions, power pipeline conditions, or switching surges (see NACE Standard RP0177[3]). If

Copyright by the NACE INTERNATIONAL
Wed Feb 02 02:28:58 2005

isolating joints exist in these corridors and must be maintained for cathodic protection design reasons, then they must be made conductive to AC currents by the use of capacitors, polarization cells, or any equivalent solid-state product. (See EPRI[5] Report EL 904 for more information.[12]) Protective devices (surge suppressors, lightning arresters, etc.) are usually designed for a specific purpose. Protective equipment must be selected and used in accordance with the intended purpose, following all manufacturer's specifications.

7.3.2 High-voltage surges may permanently damage the isolating materials used in the joint construction.

7.3.3 Isolating devices and supports may be protected with lightning arresters, electrolytic grounding cells, polarization cells, equivalent solid-state products, or combinations of these.

7.3.4 Electrical surges and fault currents of all types are potentially hazardous. Pipelines equipped with isolating devices may be protected from stray-current hazards originating from electrical power supplies through the use of grounding media and/or isolation protection equipment. Grounding media that should be considered for the discharge of induced AC, lightning, and fault current from a pipeline to earth include packaged galvanic anodes of magnesium or zinc and extruded ribbon of magnesium or zinc, with or without backfill. Electrically isolated bare steel pipeline casing, grounding grids, and ground rods should also be considered suitable grounds but must be separated from the cathodically protected pipeline by capacitors, zinc grounding cells, polarization cells, or equivalent solid-state products.

7.3.5 The manufacturer's instructions must be followed strictly when installing protective devices. In particular, the devices shall be physically secured and the connection cables properly sized.

7.3.6 The threshold rating of the protective device must be such that, even allowing for tolerances, the potential applied across the isolating device is below the device's minimum dielectric strength.

7.3.7 Lightning arresters and other protective devices shall be located to prevent the collection of dirt and moisture, which could lead to an external flashover at a relatively low surge voltage. Applicable electrical codes shall be consulted. To prevent incendiary spark hazards at fuel-transfer facilities, electrical isolation shall be avoided in areas where a combustible atmosphere may exist.

7.4 Provision for Field Testing

7.4.1 Methods of testing the effectiveness of the electrical isolation are described in Section 8. The following paragraphs describe the provision of test leads to facilitate these measurements. Test leads on buried devices should be attached on both sides of any isolating device and on the carrier pipe and casing of sleeved systems.

7.4.2 Attachment of Test Cables

7.4.2.1 Test leads on buried isolating devices shall be installed in accordance with NACE Standard RP0169, Paragraphs 4.5 and 8.6.[1]

7.4.2.2 Care should be taken when attaching test leads to prevent damage to the internal coating or lining by excessive heat.

7.4.3 Cable Type

7.4.3.1 The cable cross section and type of sheath insulation must be selected to take into account the location and expected (or future) current to be carried. Cables should be labeled for permanent identification.

Section 8: Field Testing and Maintenance

8.1 This section deals with the testing and maintenance of electrical isolation facilities. In testing the effectiveness of isolating devices installed on buried piping systems, the effect of pipe grounding and other equivalent electrical parallel circuit conditions that may exist must be considered. Conventional ohmic resistance measurements, as applied to the total isolating device, are not conclusive under field conditions. However, ohmic resistance measurements may have validity in checking individual components of an isolating device.

8.2 Field Testing

8.2.1 Several tests may be used to determine the effectiveness of an isolating device, depending on the following:

8.2.1.1 The experience and training of the staff conducting the tests;

8.2.1.2 The environment and location of the device; and

[5] Electric Power Research Institute (EPRI), P.O. Box 10412, Palo Alto, CA 94303.

Copyright by the NACE INTERNATIONAL
Wed Feb 02 02:28:59 2005

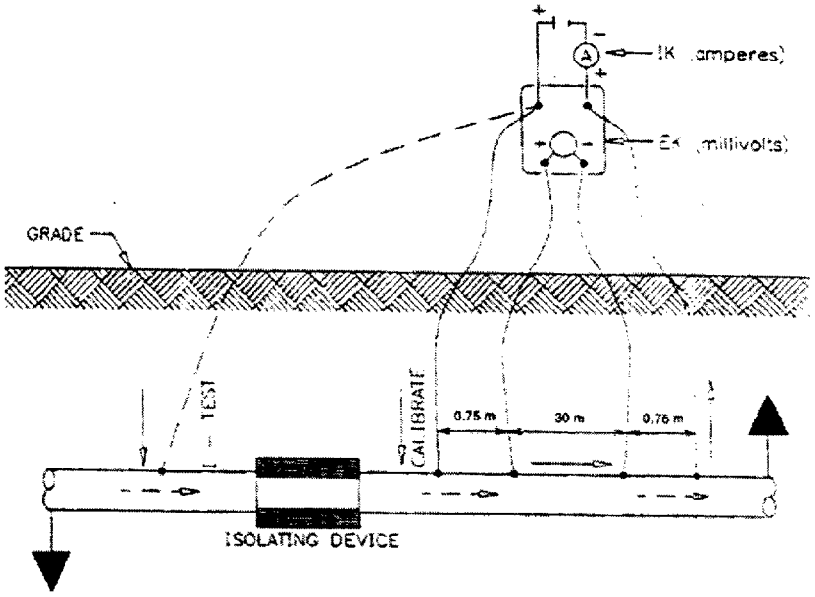
8.2.1.3 The local potential and magnitude of any cathodic or anodic electrical currents.

8.2.2 If the isolating device is installed and connected on both sides, a test may be conducted in which current is applied to the pipe on one side of the assembly and effectiveness is judged by the resulting difference in pipe-to-soil potentials measured on both sides of the device.

8.2.3 Where desired, a test can be conducted to obtain the percent of leakage at an isolating device (see Figure 12). However, if the isolating device is located adjacent to a section of above-grade piping, a voltage-drop measurement can be readily taken to determine isolating effectiveness.

8.2.4 Where the isolating device incorporates bolts that require full isolation from all other metal work (e.g., bolts used in an isolated flanged joint where an isolating washer is used beneath each bolt head or nut), it may be possible to check for proper isolation of each bolt. This check has considerable validity because bolt isolation is normally the part of the assembly that is most susceptible to failure. The test should be conducted by using an ohmmeter or other device to prove isolation between each bolt or stud and the metal against which it is to be isolated.

8.2.5 For cathodically protected pipelines, a good indication of performance may be the change in protection level adjacent to the isolating device that occurs when the isolating device is deliberately shorted. The results from such a test depend on the resistance to earth of the unprotected structure from which the protected pipeline is isolated. Where this resistance to earth is very low, a significant reduction in the level of protection may be expected.



1. Calculate the calibration factor: $K = \Delta IK/\Delta EK$ = Amps/mV

2. Calculate the percentage leakage: $\%\ \text{leakage} = \dfrac{K \times E(\text{test}) \times 100}{I(\text{test})}$

Example: Given the following data:

Calibration: IK = +6.42 Amps
EK = +3.55 mV

Test: Itest = +1.61 Amps
Etest = +.14 mV

Calculate:

$$K = \frac{6.42 \text{ Amps}}{3.55 \text{ mV}} = 1.81 \text{ A/mV}$$

$$\%\ \text{Leakage} = \frac{K \times \text{Etest} \times 100}{\text{Itest}} = \frac{1.81 \text{ A/mV} \times .14 \text{ mV} \times 100}{1.61 \text{ Amps}} = 15.7\%$$

Figure 12
Isolating Device Leakage Test

8.2.6 Audio-frequency pipe locators may indicate the effectiveness of isolating devices.

8.2.7 Radio-frequency meters may also indicate the effectiveness of isolating devices.

8.2.8 A magnetometer system may be used for testing the effectiveness of isolating devices.

8.3 Isolating Devices in Parallel - Where a number of isolating devices are installed in parallel (e.g., several flanged joints at a manifold), IR drops or current measurements in each line may be the only method of proving effectiveness of an individual device. Techniques that measure magnetic fields in the flange area may also serve as an indication of the device's effectiveness. The use of audio-frequency and radio-frequency instruments may indicate the comparative effectiveness of each individual device.

8.4 Maintenance

8.4.1 Test stations and test wires attached at isolating devices should be subject to a regular maintenance program. Figure 11 shows the typical configuration of test stations.

8.4.2 Isolating devices that are aboveground and open to the weather should be inspected periodically and cleared of accumulated debris, which could bridge isolating material. Any protective barrier coatings provided to prevent water absorption by isolating materials should be kept in good condition. Paints, thermal barriers, and tracers and reinforcements with a metallic content such as aluminum or zinc should not be used as barrier coatings.

8.4.3 When the effectiveness of isolating devices is tested on site, the effectiveness of any high-voltage protection device should also be checked.

Preface

Changes to the *National Electrical Code* affect all industries. As publisher of the code, NFPA is in a unique position to help users get up to speed on the new edition. To that end, we developed this guide to the major changes in the 1999 NEC. Our goal in developing this guide was to provide education for those whose success depends on their accurate and timely implementation of code requirements.

This changes guide brings a wealth of information together in one resource. The actual language of the code is provided, with changes highlighted. For easy cross-referencing, the relevant code page numbers are provided as well. The combination of five authors (representing over a century of code experience) results in a well-balanced perspective on the impact and application of code changes. For a complete guide to the features of this book, refer to the chart on pages viii and ix.

The criteria for selecting which changes to cover were considered carefully. The authors selected changes generated by new technologies; those with a major impact on the electrical industry; significant revisions to commonly used requirements; and those with widespread application. In addition, three broad areas of installation—residential, industrial, and commercial—were targeted. Even if a specific change does not apply directly to a code user's situation, the discussion of it should be productive.

The question "Who writes the code?" is frequently asked. The safety mission of the NEC impacts millions of people and the document is used on a daily basis by a myriad of electrical professionals including engineers, designers, manufacturers, electricians, and inspectors. These are the people who write the code. Like all of the NFPA codes and standards, the NEC is produced through a consensus standards-making process that is open to all persons who use and are impacted by the document. Beginning as proposals, new requirements make their way through a system that provides for periods of public review, technical committee review and actions, voting by the association membership, and finally issuance by the NFPA Standards Council. The National Electrical Code Committee is composed of approximately four hundred volunteers serving on twenty code-making panels and a technical correlating committee. These volunteers bring expertise from all facets of the electrical industry and the system is structured so that a balance of industry representation is provided on every panel.

Within the code text portions of this changes book, references are made to ROP, ROC, and TCC. These acronyms represent Report on Proposals, Report on Comments, and Technical Correlating Committee. The reports contain the proposals or comments, respectively, the Code Making Panel action(s), and any actions by the Technical Correlating Committee. We have provided these references as an invitation to readers to learn more about the code-making process by actually tracing the steps of a proposal that makes its way through the system and

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:25 2005

ultimately becomes a part of the 1999 NEC. The documents are available in hard copy and also at the NFPA homepage. All proposals for change are required to be provided with the technical substantiation. The quality of the NEC represents hours of intensive work by the hundreds of volunteers and NFPA staff with one goal in mind: "The practical safeguarding of persons and property from hazards arising from the use of electricity." Information on the NFPA codes and standards-making process is available at the NFPA homepage at www.nfpa.org or by contacting us at 1-617-770-3000.

We hope that the users of this book will find it a helpful productivity tool. We welcome comments and suggestions and wish you well with your use of the 1999 NEC.

ACKNOWLEDGMENTS

Many individuals contributed to the success of this project. A special thanks is given to former NFPA Chief Electrical Engineer Tim Croushore and the present members of the NFPA electrical staff.

A Guide to Using This Book

Subject covered in the NEC section under discussion. These topics are listed in the table of contents for quick access by the user.

The pages on which the code text appears in the 1999 NEC.

What happened to the code:
- *Relocation* means that the technical content did not change significantly, but the material was moved.
- *Revision* means that the requirements changed.
- *New* means that new requirements or clarification of requirements were added.

NEC section where this change occurred, numbered according to the 1999 edition. This book is arranged in 1999 NEC numerical sequence.

Information in the shaded box at the beginning of each change allows the user to navigate quickly through the new code.

NEC p. 88

250-50 Number of Grounding Electrodes Required

Type of Change Revision

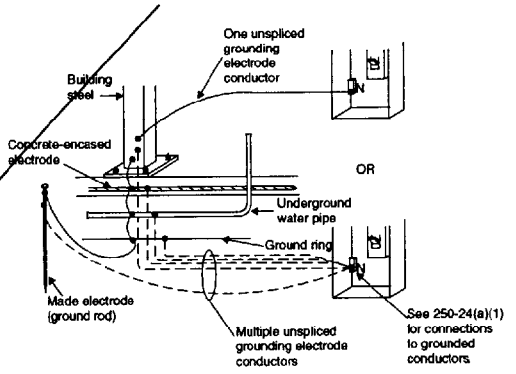
BRIEF SUMMARY

All installations. One or more grounding electrode conductors are permitted.

Code Language

250-50. Grounding Electrode System. If available on the premises at each building or structure served, each item (a) through (d), and any made electrodes in accordance with Sections 250-52(b), (c), and (d), shall be bonded together to form the grounding electrode system. The bonding jumper(s) shall be installed in accordance with Sections 250-64(a), (b), and (c) shall be sized in accordance with Section 250-66, and shall be connected in the manner specified in Section 250-70. (ROP 5-224a, 5-225) (ROC 5-100)

An unspliced grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system **or to one or more grounding electrode(s) individually.** It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it. (ROP 5-227)



Grounding Electrode Conductors

142 NFPA's 1999 NEC Changes

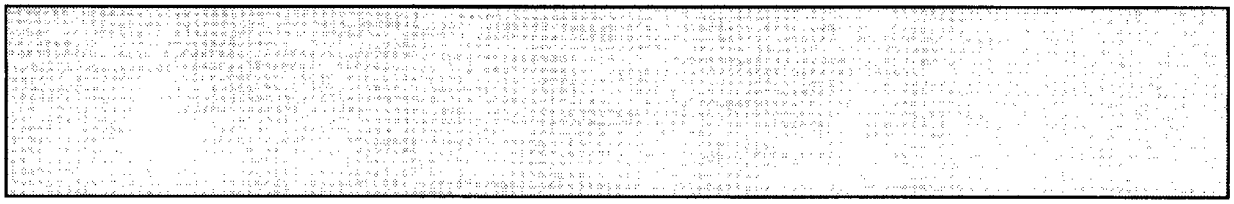
Users will find two important pieces of information at a glance:
- The installations or occupancies affected by the change (e.g., commercial, residential, industrial, health care).
- A short description of the impact of the change—the bottom line. This allows users to quickly assess whether the change is important to them.

The new requirements as they appear in the 1999 NEC. New text is indicated by **boldface** type; deleted text is indicated by strikethrough type. When a long section of text has been completely rewritten, the user is referred to a chart or table diagramming changes.

ROP, ROC, TCC. Those who wish to trace the history of a change can use this information. For an explanation of the NEC code-making process, see the preface to this book.

Each change has been illustrated by an electrical draftsman.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:26 2005



Wide margins provide a space for notes and bookmarks.

How do you apply this change in real life? The Application section discusses on-the-job situations in which the change is important. Whether you need to solve an actual installation problem or just need to know where the change might be important, turn to this section. Together with the illustration, it will show how to put code changes into effect.

The Background and Explanation text expands on the brief summary given above. This section includes:

- The NEC committee rationale for making the change
- The basic logic behind the change
- A problem that the change will fix
- Relevant technical information
- Cross-reference to other relevant code sections
- Historical perspective on the change

As publisher of the code, NFPA is the best source for the most accurate and timely information on the code changes.

Spiral binding allows the book to lie flat or fold to consume less space.

Application

The illustration shows a collection of the grounding electrodes listed in Sections 250-50(a) through (d) and 250-52. The solid lines indicate a single unspliced grounding electrode conductor run to one of the electrodes, in this case the building steel. The other electrodes are bonded together to form the grounding electrode system. The single grounding electrode conductor must be full sized according to Section 250-66. The bonding conductors can be sized on the basis of the electrodes they connect to. For instance, the bonding conductor between the ground ring and the ground rod would not have to be larger than No. 6 copper.

The dashed lines in the illustration show an alternative way of running grounding electrode conductors and bonding the electrodes together. Separate grounding electrode conductors may be run to each electrode. In this case, the grounding electrodes are bonded together in the service equipment. The individual conductors may be sized on the basis of the phase conductors and the electrodes they connect to. For example, the conductors to the water pipe and the building steel would have to be sized from Table 250-66, but the conductors to the ground rod, ground ring, and concrete-encased electrode are permitted to be smaller in accordance with Section 250-66(a), (b), or (c).

The illustration shows two extremes: one grounding electrode conductor; or one grounding electrode conductor for each electrode. The electrodes could also be grouped. For example, one conductor could be run to the ground ring and ground rod and sized for the ground ring. Another conductor could be run to the building steel, water pipe, and concrete-encased electrode and sized for the water pipe or building steel.

Background and Explanation

This change is intended to be a clarification. No technical requirement was actually modified by this change. However, some authorities interpreted the previous language (this was in Section 250-81 in the 1996 NEC) to require a single grounding electrode conductor. Others interpreted the previous language to mean that only one grounding electrode conductor had to be unspliced and the others were really just bonding conductors. This change should help to make interpretations more uniform. With this change it should be clear that each grounding electrode conductor must be run unspliced to an electrode, and there can be more than one. Note that the main difference between the alternatives in the illustration is the location of the bonding point between electrodes at the service equipment or at each electrode.

NFPA's 1999 NEC Changes 143

About the Authors

The authors of NFPA's *1999 NEC Changes* provide an insider's perspective to interpreting and applying key changes to the *National Electrical Code*. As members of various NEC committees and state electricians licensing boards, the contributors to this book are nationally recognized experts in the field of electrical safety and on the *National Electrical Code* itself. Their backgrounds include engineering, electrical contracting, system design, and inspecting electrical installations. All five authors are instructors for NFPA's NEC seminars, publish interpretive and explanatory material on the NEC, and are closely involved with the NEC development process.

Mark W. Earley, P.E., Editor-in-Chief

Mark W. Earley, NFPA's Assistant Vice President of Engineering and Acting Chief Electrical Engineer, is secretary of the National Electrical Code Technical Correlating Committee. He is editor-in-chief of NFPA's *National Electrical Code Handbook* and coauthor of NFPA's reference book *Electrical Installations in Hazardous Locations*. Prior to joining NFPA, Mr. Earley worked as an electrical engineer at the Factory Mutual Research Corporation and served on several of NFPA's electrical committees and NEC Code Making Panels.

Mark C. Ode

Mark C. Ode, NFPA's Senior Electrical Specialist, is staff liaison and secretary to the NFPA Electrical Equipment in Chemical Atmospheres Committee. Former executive secretary for the NFPA Electrical Section, he was also editor of the NFPA electrical section news bulletin, *Current Flashes*. Prior to joining NFPA, Mr. Ode worked for over twenty-three years as a licensed electrician, licensed electrical contractor, and engineering inspector in the state of Arizona, and he taught electrical code for ten years at Maricopa County Community College. He is IAEI certified for one- and two-family dwellings, general electrical, and electrical plan check; and he is ICBO certified as a general electrical inspector. He was vice president of field operations for an engineering firm and was president of Ode Electric for fifteen years.

Jeffrey S. Sargent

Jeffrey S. Sargent is Electrical Specialist at NFPA and author of NFPA's forthcoming handbook for electrical inspectors, *Electrical Inspection Manual and Checklists*. A licensed master electrician and IAEI-certified electrical inspector, Mr. Sargent has also served as state electrical inspector with the New Hampshire

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:26 2005

Electricians Licensing Board and as an electrical code instructor in the New Hampshire Technical College system. He is editor of the NFPA Electrical Section News Bulletin, *Current Flashes*, and is executive secretary for the NFPA Electrical Section.

Dann M. Strube

Dann M. Strube is currently a consultant and electrical course instructor and was formerly chief electrical inspector for the Commonwealth of Kentucky and chairman of the Kentucky chapter of the IAEI. In addition to serving as a primary developer of NFPA's NEC seminar, Mr. Strube also worked on NFPA's *NEC Changes* video. Mr. Strube is a certified electrical inspector in Kentucky and Indiana and has contributed articles to such publications as *CEE News* and *NFPA Journal.* Formerly a member of the NEC Code Making Panel 6, which governs conductors for general wiring, flexible cords and cables, and fixture wire, he currently serves on NFPA's Committee on Electrical Equipment in Chemical Atmospheres. He has taught the NEC for over twenty years.

Noel Williams

Noel Williams is a licensed master electrician in the states of Utah, Colorado, and Wyoming. He is ICBO and IAEI certified as an electrical inspector. He has supervised and managed electrical construction projects for over twenty years. For over ten years he was chairman of the Electricians Licensing Board for the state of Utah and is currently chairman of the NEC Advisory Committee for the Utah Uniform Building Code Commission. Mr. Williams serves on the executive committee of the Utah chapter of IAEI. Currently a consultant and contributing editor for *CEE News,* he also taught electrical apprentices at Salt Lake Community College for six years and has developed and taught electrical courses for electricians and inspectors for over ten years.

Article 100 Definition of Receptacle

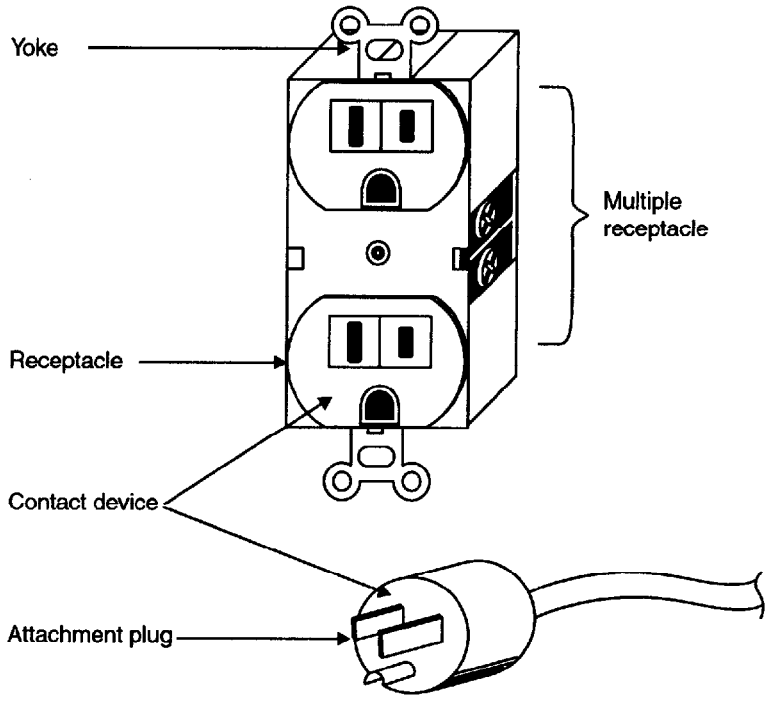
Type of Change Revision

BRIEF SUMMARY

All installations. The definitions of "receptacle" and "multiple receptacle" are revised.

Code Language

Receptacle. A receptacle is a contact device installed at the outlet for the connection of ~~a single contact device~~ **an attachment plug.** A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is **two or more contact devices on the same yoke.** (ROP 1-127) (ROC 1-197)



Definition of Receptacle

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:29 2005

Application

The term "receptacle" is used throughout the code. Although "multiple receptacle" is used less frequently, clear definitions of both terms are necessary for proper interpretation and use of the code. The accompanying illustration shows the components of a multiple receptacle and illustrates the terms used in the definition.

Background and Explanation

The use of the term "contact device" twice in the first sentence could be confusing and did not properly distinguish between receptacles and attachment plugs, both of which are contact devices.

In the 1993 NEC, the last two sentences of this definition were a Fine Print Note (FPN). The FPN was converted to mandatory language by making it part of the definition in the 1996 NEC. This created some conflicts with uses of the terms "device," "equipment," and "multiple receptacle" elsewhere in the code. The substantiation for this change specifically mentioned Section 210-4(b), where a multiple receptacle is included in the description "more than one device or equipment on the same yoke." The revised definition explains that a multiple receptacle is more than one device but is a single piece of equipment.

Article 100 Definition of Service Conductors

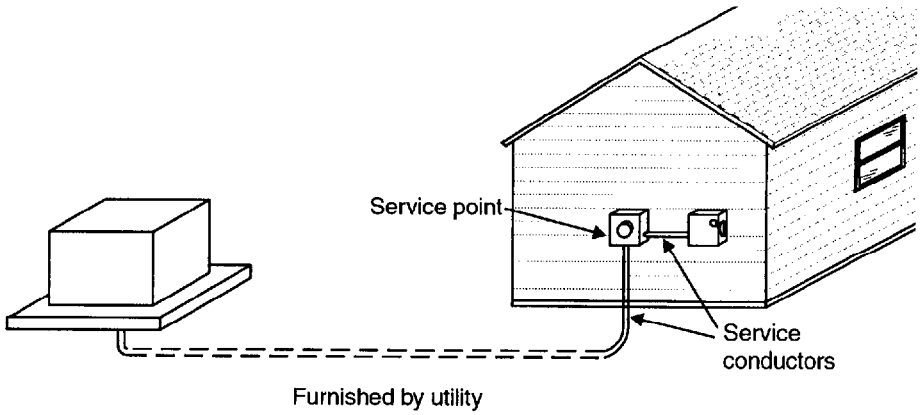
Type of Change Revision

BRIEF SUMMARY

All occupancies. This change clarifies where conductors are to be classified as service conductors.

Code Language

Service Conductors. The conductors from the service point ~~or other source of power~~ to the service disconnecting means. (ROP 1-134)



Definition of Service Conductors

Application

Conductors that supply power to a structure are classified as service conductors only when they are connected to a utility system. The term "service point" as used in this definition is also a defined term in Article 100. Service point is the point of connection between the facilities of the servicing utility and the premises wiring system. Where a building or structure is supplied by a customer-owned transformer, the supply is not a service and therefore is not covered by the requirements of Article 230. Such supply systems are feeders, taps, or transformer secondaries and are covered by Articles 215, 225, and 240.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:29 2005

Background and Explanation

The 1996 definition included the phrase "other sources of power," which could be interpreted as including feeders, taps, and transformer secondary conductors supplied by customer-owned power sources. These supply systems are covered within other code articles and the requirements for services and service conductors (including service grounding requirements) are not applicable.

110-10 Fault Current Ratings—Listed Equipment

Type of Change Revision

BRIEF SUMMARY

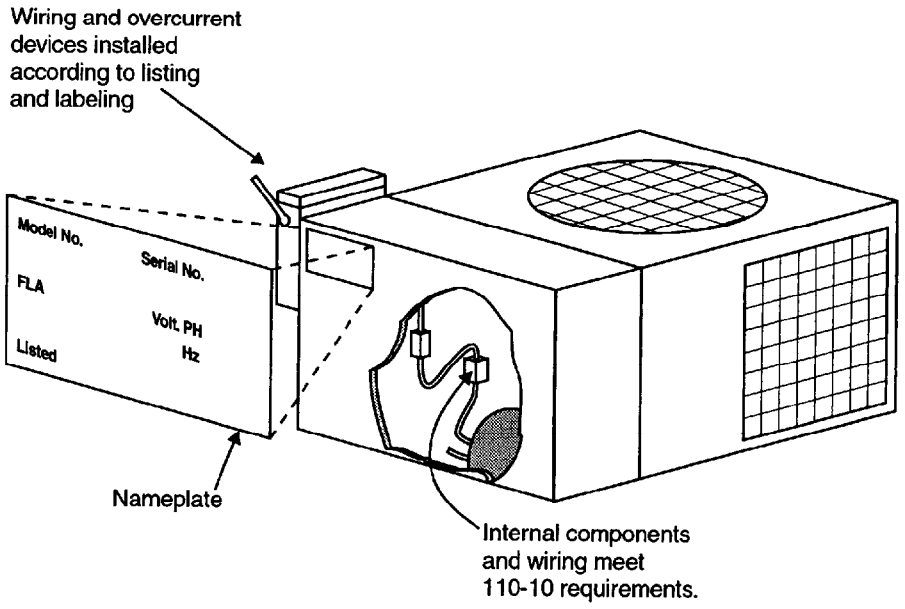
All installations. A new sentence has been added to this section to indicate that listed equipment is understood to comply with Section 110-10.

Code Language

110-10. Circuit Impedance and Other Characteristics.

•
•
•

Listed products applied in accordance with their listing shall be considered to meet the requirements of this section. (ROP 1-176, 1-177, 1-178, TCC)



Listed Packaged A/C Unit

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:30 2005

Application

Most installations involve some listed equipment. Section 110-10 requires that the components of a circuit, especially the characteristics of overcurrent devices, be selected so that a fault can be cleared without extensive damage to the components of the circuit. If listed products are "applied in accordance with their listing," they need not be further investigated in the field for compliance with Section 110-10.

The illustration shows an air conditioning unit. The unit is listed and includes instructions for selection of overcurrent devices and conductors. If the listing and labeling instructions are complied with in the installation, the authority having jurisdiction can be assured that the internal wiring and components will be protected from the "extensive damage" mentioned in this section.

Background and Explanation

Without the new last sentence in this section, some inspectors were attempting to determine what was meant by extensive damage with regard to specific products. In many cases they applied their own definitions to equipment where the definition was already covered in product standards. The listing of a piece of equipment includes the evaluation of damage that may occur to the equipment in the event of a fault. Different types of equipment have different levels of damage that is considered "acceptable." Fires external to the equipment and shock hazards produced by faulted equipment are primary indicators of extensive damage. The evaluation of these factors is generally performed by qualified testing laboratories rather than by field inspectors.

110-14(c) Converting Exceptions and Terminal Temperature Limits—Motors

Type of Change Revision

BRIEF SUMMARY

All occupancies. The exceptions to the rules for selecting conductor ampacity based on the temperature rating of the equipment terminals have been converted to positive code text. New rules have been added for motor circuit conductors.

Code Language

110-14. Electrical Connections.

•
•
•

(c) Temperature Limitations. The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device. Conductors with temperature ratings higher than specified for terminations shall be permitted to be used for ampacity adjustment, correction, or both.

(1) Termination provisions of equipment for circuits rated 100 amperes or less, or marked for Nos. 14 through 1 conductors, shall be used only for one of the following:

(a) Conductors rated 60°C (140°F), or

(b) Conductors with higher temperature ratings, provided the ampacity of such conductors is determined based on the 60°C (140°F) ampacity of the conductor size used, or (ROP 1-196a) (ROC 1-243, 1-248)

(c) Conductors with higher temperature ratings if the equipment is listed and identified for use with such conductors, or (ROC 1-243, 1-248)

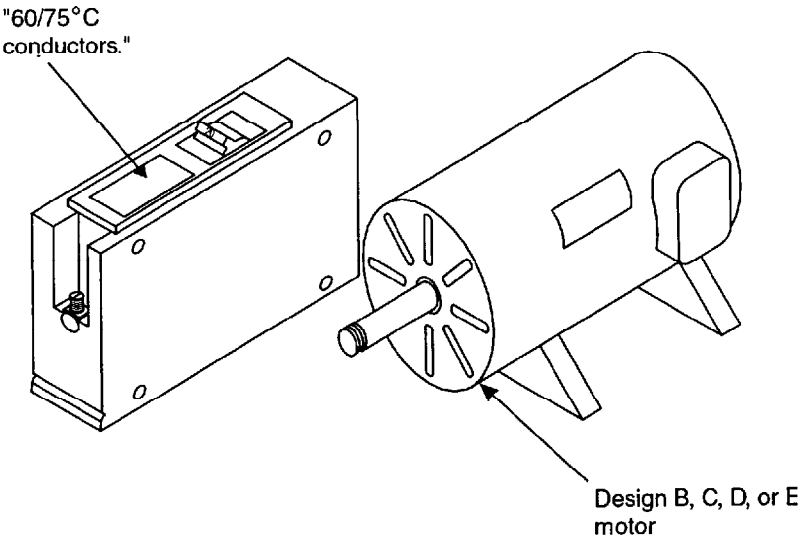
(d) For motors marked with design letters B, C, D, or E, conductors having an insulation rating of 75°C (167°F) or higher shall be permitted to be used provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity. (ROC 1-248)

(2) Termination provisions of equipment for circuits rated over 100 amperes, or marked for conductors larger than No. 1, shall be used only for

(a) Conductors rated 75°C (167°F), or

(b) Conductors with higher temperature ratings provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity of the conductor size used, or up to their ampacity if the equipment is listed and identified for use with such conductors. (ROP 1-199a) (ROC 1-250)

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:30 2005



75°C Ampacities Permitted for Motor Circuits

Application

Where equipment terminals are rated 100 amperes or less or are marked for use with No. 14 through No. 1 conductors, the basic rule is that only 60°C rated conductors can be used. For terminals rated over 100A amperes or marked for conductors larger that No. 1, only 75°C conductors can be used.

In both cases conductors with higher temperature ratings can be used provided the conductor ampacity is selected based on the insulation rating corresponding to the rating of the terminals on the equipment. Higher conductor ratings may also be used if the equipment is listed and identified for use with the higher temperature ratings and corresponding increase in ampacity.

New language has been included in this section that provides guidance for selecting conductor temperature ratings and ampacities where they are directly connected to electric motors. Most motors are manufactured in accordance with the NEMA motor/generator standard and are generally not required to be listed. In previous editions of the code, the use of 75°C conductors for motors rated 100 amperes or less or connected with No. 14 through No. 1 conductors was permitted; however, the ampacity selection had to be made from the 60°C column. This section now specifically permits the use of 75°C conductors at the 75°C ampacity for motors marked with a design letter of B, C, D, or E. The terminals of the equipment from which the conductors to the motor receive their supply must be listed for use with the higher rated conductor.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:30 2005

Background and Explanation

Section 110-14(c) is an example of a significant format change that is found in many sections of the 1999 NEC. Throughout the 1999 NEC, users of the document will find that material formerly expressed within exceptions is integrated into the main code language. Many of these changes were made because the language of the exception presented a mandatory rule. This revision to the exceptions was undertaken as part of the effort to enhance the usablity of the revision to the exceptions was undertaken as part of the effort to enhancethe usabilty of the NEC. Specific language has been added to clarify the temperature selection requirements for conductors directly connected to a motor.

Wed Feb 02 02:30:31 2005

110-26 Locked Equipment Enclosures

Type of Change Revision

BRIEF SUMMARY

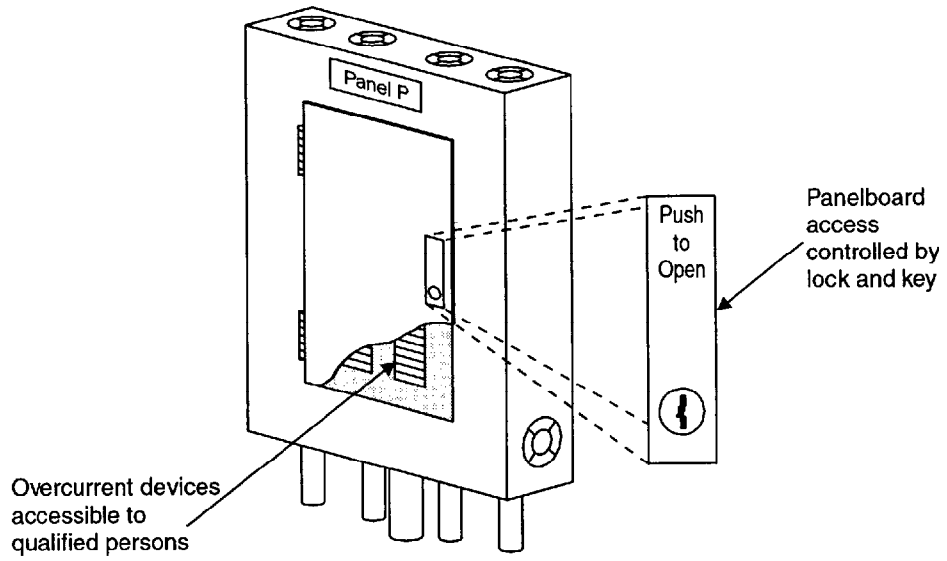
All installations. Equipment behind locked doors or in locked enclosures are considered to be accessible to qualified persons.

Code Language

110-26. Spaces About Electrical Equipment.

•
•
•

Enclosures housing electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons. (ROP 1-260, 1-225) (ROC 1-253, 1-294)



Locked Enclosures

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:31 2005

Application

Article 100 reads as follows: "Accessible: (as applied to equipment) Admitting close approach: not guarded by locked doors, elevation, or other effective means." This has often been interpreted as meaning that panelboards and similar equipment cannot be located behind locked doors or have locked doors. The new second sentence in Section 110-26 makes it clear that such installations are considered to be accessible to qualified persons. The obvious assumption is that qualified persons will have appropriate keys.

The illustration shows a panelboard access controlled by lock and key. The overcurrent devices inside the enclosure are considered to be accessible to qualified persons. The panelboard could also be installed behind a locked equipment room door and still be considered readily accessible.

Background and Explanation

A similar statement already existed in Section 110-31, but that section only covers installations over 600 volts. This new wording was added to cover installations for equipment of 600 volts or less. Inspectors have previously had to read between the lines to find this permission. Often they resorted to combining the definition of "accessible" as applied to equipment with the definition of "accessible, readily." Equipment that is readily accessible must be "Capable of being reached quickly . . ." by persons ". . . to whom ready access is requisite. . ." without having to remove obstacles. If the person to whom access is requisite has a key, then a locked door does not create an obstacle to quickly reaching the equipment.

Wed Feb 02 02:30:31 2005

110-26(a) Equipment Extensions into Work Space

Type of Change Revision

BRIEF SUMMARY

All occupancies. The dimensions of the work space required in front of electrical equipment are clarified.

Code Language

110-26. Spaces About Electrical Equipment.

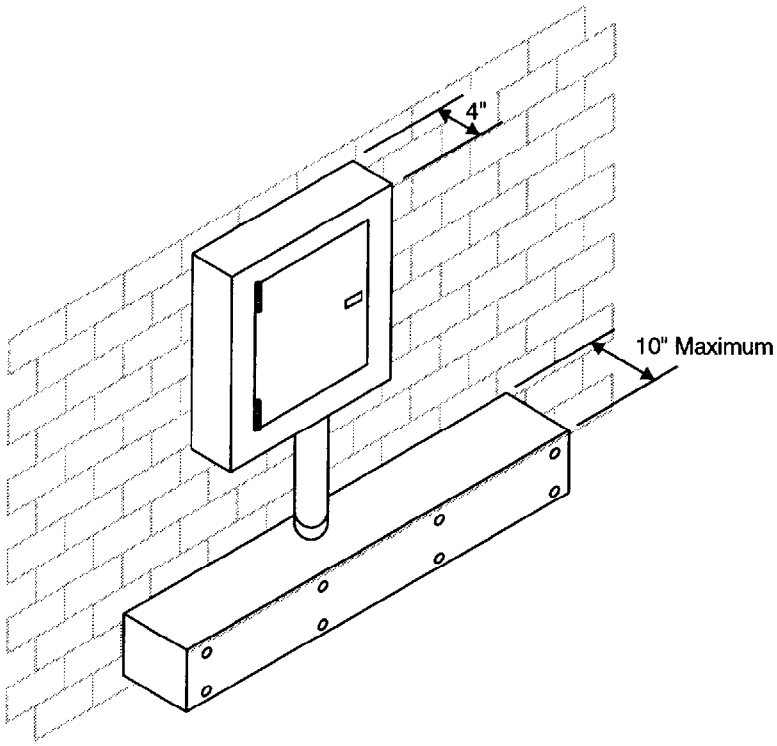
(a) Working Space. Working space for equipment operating at 600 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance while energized shall **comply with the dimensions of (1), (2), and (3)** or as required or permitted elsewhere in this *Code*. (ROP 1-225) (ROC 1-259)

(1) Depth of Working Space. The depth of the working space in the direction of access to live parts shall not be less than indicated in Table 110-26(a). Distances shall be measured from the live parts if such are exposed or from the enclosure front or opening if such are enclosed. (ROP 1-225)

(2) Width of Working Space. The width of the working space in front of the electric equipment shall be **the width of the equipment or** 30 in. (762 mm), **whichever is greater.** In all cases, the work space shall permit at least a 90 degree opening of equipment doors or hinged panels. (ROP 1-225)

(3) Height of Working Space. The work space shall be clear and extend from the grade, floor, or platform to the height required by Section 110-26(e). Within the height requirements of this section, **other equipment associated with the electrical installation located above or below the electrical equipment shall be permitted to extend not more than 6 in. (153 mm) beyond the front of the electrical equipment.** (ROP 1-214, 1-225)

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:31 2005



Associated Equipment Permitted to Extend ≤ 6 Inches into Work Space

Application

Where electrical equipment such as a wireway or auxiliary gutter is installed above or below equipment such as a panelboard, it is usually deeper than the panelboard cabinet. The revised wording in Section 110-26(a)(3) allows such equipment to extend up to 6 inches further into the work space required in front of the panelboard.

Revised wording of Section 110-26(a)(2) makes it clear that the minimum width of the work space is 30 inches. If the equipment is wider than 30 inches, the minimum width is based on the actual width of the equipment.

Background and Explanation

The wording contained in this section of the 1996 NEC indicated that other equipment (including electrical equipment) could not extend into the working space required in front of a specific piece of electrical equipment that is likely to be worked on while energized. The intent of the requirement was to preclude the installation of equipment, such as a large transformer, in the working space required for other electrical equipment, such as a panelboard. This type of installation impeded proper access and created an unsafe condition for personnel working on energized equipment. Small equipment that extends a few inches into the work space does not create the same hazard.

Other revisions were made in this section to make the rules easier to understand. In the 1996 edition both depth and width were covered in Section 110-16(a). There were 3 exceptions, all relating to depth. The revision divided this section into 110-26(a)(1) depth with 3 exceptions, (2) width, and (3) height.

Wed Feb 02 02:30:31 2005

110-26(f) Panelboard and Switchboard Space

Type of Change Relocation

BRIEF SUMMARY

All installations. The rules for dedicated spaces around switchboards and panelboards was moved from Section 384-4.

Code Language

110-26. Spaces About Electrical Equipment.

•
•
•

(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2). (ROP 1-260)

Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.

(1) Indoor. ***For indoor installations, the dedicated space shall comply with the following.***

(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.

Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with b., shall be permitted in areas that do not have the dedicated space described in this rule.

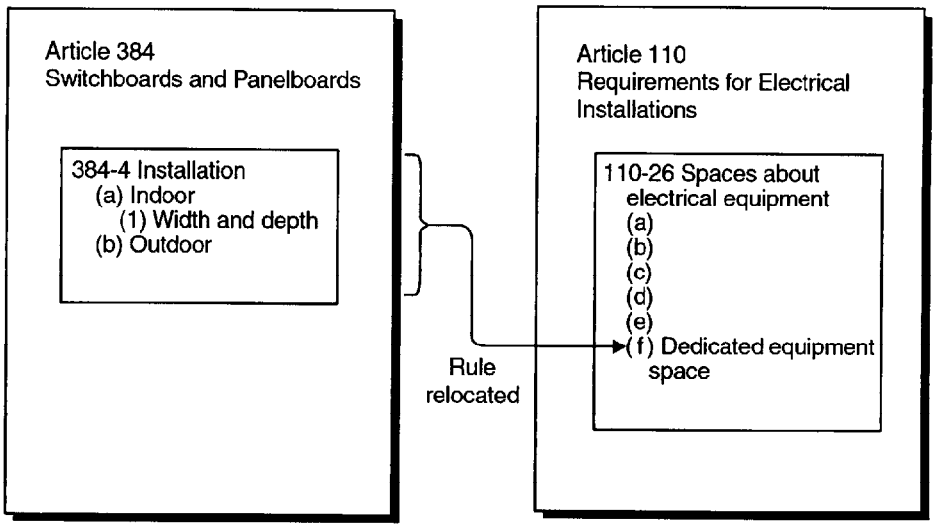
(b) Foreign Systems. The space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.

(c) Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.

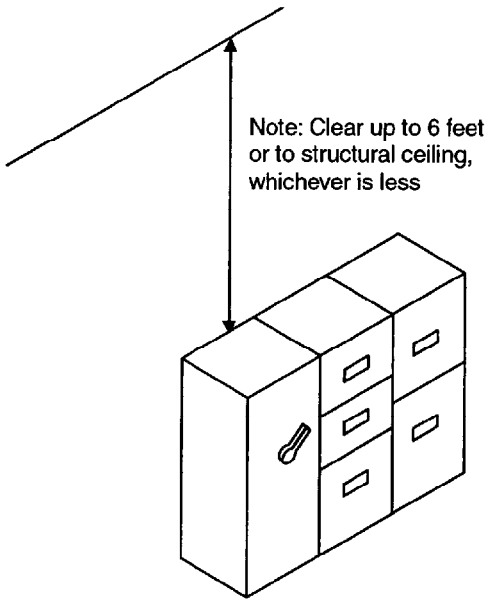
Copyright by the National Fire Protection Association
Wed Feb 02 02:30:32 2005

(d) Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling. (ROC 9-76) (TCC 9-76)

(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone. (ROP 1-260)



Dedicated Space for Panelboards



Required Clear Space Above Switchboards and Panelboards

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:32 2005

Application

The rules for working space and dedicated space are closely related. Working space is the area intended for use by personnel. Dedicated space is the area intended for use by the equipment itself. The working space requirements apply to equipment "likely to require examination, adjustment, servicing, or maintenance while energized." Such equipment includes panelboards, control panels, motor controllers, disconnects, and the like, some of which are routinely used in all types of occupancies. Horizontal and vertical dedicated space composed of an area equal to the footprint of the equipment is required for switchboards, panelboards, and motor control centers. With this change, the requirements for working space, access, illumination, headroom, and dedicated space are all grouped together. The illustration shows the content of Section 384-4 moved to Section 110-26(f).

Background and Explanation

These requirements were relocated to enhance the usability of the code. All of the rules in the revised Section 110-26 are related to the size, arrangement, access, and usability of spaces where electrical equipment is installed. Grouping these related requirements together makes the rules easier to locate and apply.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:32 2005

110-26(f) Panelboard and Switchboard Space Alternative

Type of Change Revision

BRIEF SUMMARY

All occupancies. Height requirement for dedicated space above switchboards, panelboards, and motor control centers was revised.

Code Language

110-26. Spaces About Electrical Equipment.

•
•
•

(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2). (ROP 1-260)

Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.

(1) Indoor. For indoor installations, the dedicated space shall comply with the following.

(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of **6 ft (1.83 m)** above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.

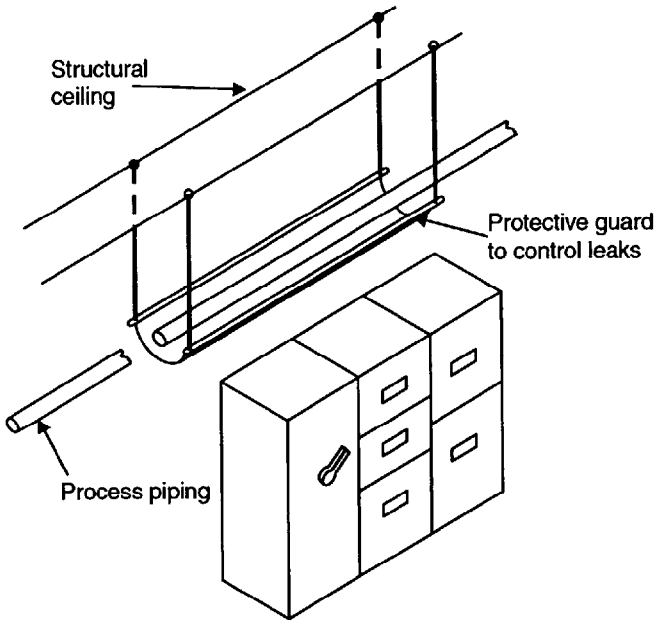
Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with (b), shall be permitted in areas that do not have the dedicated space described in this rule.

(b) Foreign Systems. The space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.

(c) Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.

(d) Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling. (ROC 9-76) (TCC 9-76)

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:32 2005



Foreign Piping with Spill Protection

Application

The major revision is to the amount of clear space requird for the equipment covered within this section. In the 1996 code, this section specified that the clear space was from floor to the structural ceiling or to up to 25 feet. The 1999 code requires that the clear space be from the top of the equipment to 6 feet above the equipment. As in previous editions, the clear space is only the equipment footprint. Equipment that is not associated with the electrical installation is not permitted to be installed within this space. The 6-foot clear space facilitates raceway or cable access into the top of equipment.

In addition, the concerns over accidental spillage have been addressed. The space above the 6-foot zone up to the structural ceiling is required to be kept clear of foreign systems whose failure could endanger the electrical equipment. The space above the 6-foot zone is permitted to contain foreign systems such as plumbing or mechanical systems, where guards or deflector shields are provided that prevent spillage onto the electrical equipment.

Background and Explanation

Many inspectors and installers felt the former 25-foot limit was not logical since a liquid flowing from a broken pipe would not evaporate within 25 feet. The revision reflects that logic by removing the 25-foot rule but allowing other protective measures and by requiring a 6-foot space above the specific types of equipment to facilitate future access for wiring additions into the equipment.

NEC pp. 28–33

Article 110 Parts B, C, D Rules from Article 710

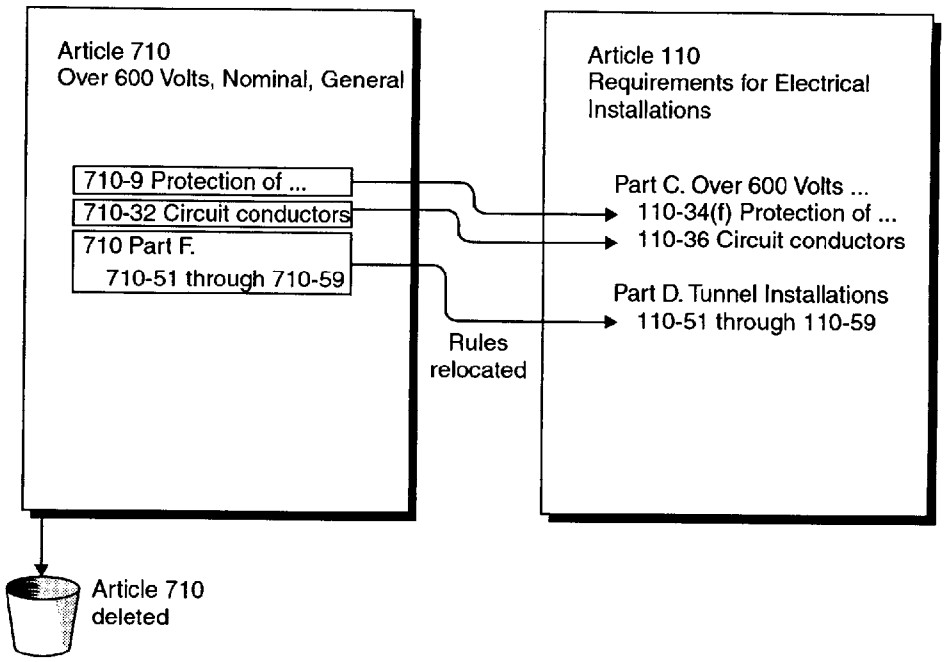
Type of Change Relocation

BRIEF SUMMARY

Commercial and industrial. General requirements from Article 710 were moved to Article 110 and Article 710 was deleted. Article 110 was reorganized into four parts.

Code Language

See flow chart.



Relocation of High Voltage Requirements

Application

Installations of equipment over 600 volts are most common in industrial establishments. However, such installations are also found in large commercial installations, especially where power is distributed through many buildings or to many floors of a high-rise building. The general requirements that apply to all such installations have been grouped together in Article 110.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:33 2005

The existing rules of Part A of Article 110 have been divided into Part A, "General," and Part B, "600 Volts, Nominal, and Under." Section 110-30 was revised to refer to all of Part A. Sections 110-16 and 110-17 were renumbered as 110-26 and 110-27, respectively.

The illustration shows the origin and new locations of the relocated rules. The relocation of these sections adds general installation requirements for service equipment, metal-enclosed power switchgear, industrial control assemblies, and circuit conductors to the existing rules of what was Part B. Part B has been changed to Part C, "Over 600 Volts, Nominal." A new Part D, "Tunnel Installations," was also added. The new Part D contains the requirements that were previously in Part F of Article 710.

Background and Explanation

Prior to the 1999 NEC, the requirement for installations involving systems over 600 volts were located in several areas of the code. Some articles, such as Article 110, had special parts for over 600 volts. Other articles, such as Article 225, had the rules for over 600 volts located in numerous separate sections. Article 710 contained only requirements for over 600 volts. These numerous locations for the "high voltage" rules made it necessary to refer to several articles to find similar requirements. To improve this situation, the various sections of Article 710 were reexamined and moved to appropriate articles. Those sections dealing with general installation requirements not specific to wiring methods, overcurrent protection, or equipment, were moved to Article 110. They are now grouped with like requirements. For example, since 710-9 had to do with protection of equipment, it was moved to 110-34, which addresses work space and guarding for equipment over 600 volts.

In addition to the relocation of material from Article 710, Article 110 was reorganized to separate general requirements from those requirements that are specific to installations of 600 volts or less. This change and the rewording of Section 110-30 are intended to clarify that all of Part A applies to installations over 600 volts. For installations over 600 volts, Part A is supplemented or modified by Part C. Sections 110-16 and 110-17 were renumbered to locate the rules for work space and guarding of live parts for 600 volts and under into Part B.

200-7(c) Switch Loop Conductor Identification

Type of Change Revision

BRIEF SUMMARY

All occupancies. Requirement for reidentification of white or natural gray conductors in switch loops was changed.

Code Language

200-7. Use of Insulation of a White or Natural Gray Color **or with Three Continuous White Stripes.**

(a) General. The following shall be used only for the grounded circuit conductor, unless otherwise permitted in (b) and (c):

•
•
•

(c) Circuits of 50 Volts or More. The use of insulation that is white or natural gray **or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) through (3).**

(1) If part of a cable assembly and where the insulation is permanently re-identified to indicate its use as an ungrounded conductor, by painting or other effective means at its termination, and at each location where the conductor is visible and accessible.

(2) Where a cable contains an insulated conductor for single-pole, 3-way, or 4-way switch loops, and the conductor with white or natural gray **insulation or a marking of three continuous white stripes** is used for the supply to the switch, but not as a return conductor from the switch to the switched outlet. In these applications, **the conductor with white or natural gray insulation or with three continuous white stripes shall be permanently re-identified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.**

(3) Where a flexible cord, having one conductor identified by a white or natural gray outer finish **or three continuous white stripes** or by any other means permitted by Section 400-22, is used for connecting an appliance or equipment permitted by Section 400-7. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor. (ROC 5-27)

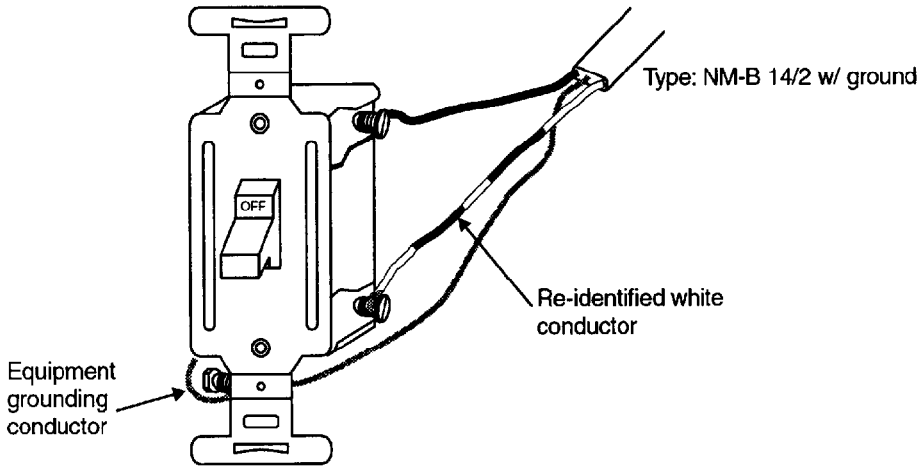
Wed Feb 02 02:30:33 2005



Permanent Identification of White Conductor in Switch Loop

Application

This change will prohibit the use of a white or gray conductor in a cable system to supply a switch unless re-identified. Where the white conductor is used in a switch loop it can only be used to supply the switch and it must be permanently re-identified. The identification must be done anywhere the conductor is visible or accessible.

Background and Explanation

While the change would apply to all occupancies, the principal reason for the change is safety in residential occupancies. It is not unusual for homeowners to undertake minor electrical repairs. By requiring re-identification where a white colored conductor is used as an ungrounded conductor, the chance of confusion and misconnection is reduced.

Article 210 Reorganization and Relocation of Requirements

Type of Change Reorganization

BRIEF SUMMARY

All Installations. Article 210 was reorganized and some provisions were relocated from or to Article 220.

Code Language

See table.

Article 210 Reorganization

1996 NEC Section	*Section Heading or Description*	*1999 NEC Section*
220-4	Branch Circuits Required	210-11
220-4(a)	Number of Branch Circuits	210-11(a)
220-4(d)	Load Evenly Proportioned Among Branch Circuits	210-11(b)
	Dwelling Units	210-11(c)
220-4(b)	Small Appliance Branch Circuits	210-11(c)(1)
220-4(c)	Laundry Branch Circuits	210-11(c)(2)
210-52(d) (part)	Bathroom Branch Circuits	210-11(c)(3)
210-19	Conductors—Minimum Ampacity and Size	210-19
220-3(a), 210-22(c), 210-19 (part)	General (Continuous and Noncontinuous Loads)	210-19(a)
210-19(a) (part)	Multioutlet Branch Circuits	210-19(b)
210-19(b)	Household Ranges and Cooking Appliances	210-19(c)
210-19(c)	Other Loads	210-19(d)
210-20	Overcurrent Protection	210-20
210-22(c), 220-3(a)	Continuous and Noncontinuous Loads	210-20(a)
210-20(1)	Conductor Protection	210-20(b)
210-20(2)	Equipment	210-20(c)
210-20(3)	Outlet Devices	210-20(d)

Application

Article 210 applies to all installations that involve branch circuits unless they supply only motor loads. (See Section 210-1.) A new Section 210-11 provides the method for determining the number of branch circuits required. Most of Section 210-11 was relocated from Article 220, Section 220-4. A complete listing of the sections that were relocated either from Article 220 or within Article 210 is given in the table. There is no substantive change in the effect or application of these rules.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:34 2005

Background and Explanation

This change was made as part of the effort to enhance the usability of the code. Article 220, which is titled Branch-Circuit, Feeder, and Service Calculations, contained material that was not directly related to calculations. Specifically, in the 1996 NEC, portions of Section 220-3 and all of Section 220-4 were about branch-circuit requirements and not about calculations. Those rules were moved into Article 210.

Section 210-22 also contained load calculation requirements, which were relocated to Article 220. Paragraph (c) of Section 210-22, which was concerned with continuous and noncontinuous loads, was combined with Section 220-3(a) and relocated to Section 210-20(a). In addition some sections in Article 210 were relocated to enhance clarity. For example, part of Section 210-52(d) was about requirements for the branch circuit and part was about required outlets. The rule requiring the outlets stayed in Section 210-52, "Dwelling Unit Receptacle Outlets," located in Part C, "Required Outlets." The rule requiring a 20 ampere-rated branch-circuit was moved to the new Section 210-11, "Branch Circuits Required," under Part A, "General Provisions."

NEC pp. 37 & 38

210-4(d) & 210-5 Identification of Conductors/Multiwire

Type of Change Revision

BRIEF SUMMARY

Rules for identification of conductors are clarified.

Code Language

210-4. Multiwire Branch Circuits.

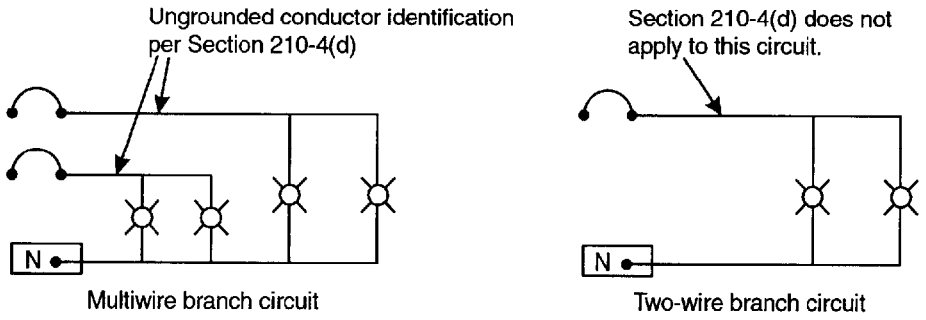
•
•
•

(d) Identification of Ungrounded Conductors. Where more than one nominal voltage system exists in a building, each ungrounded conductor **of a multiwire branch circuit, where accessible,** shall be identified by phase and system. This means of identification shall be **permitted to be by separate color coding, marking tape, tagging, or other approved means and** shall be permanently posted at each branch-circuit panelboard. (ROP 2-18) (ROC 2-9)

210-5. Identification for Branch Circuits. (ROP 2-23)

(a) Grounded Conductor. **The grounded conductor of a branch circuit shall be identified in accordance with Section 200-6.** (ROP 2-23)

(b) Equipment Grounding Conductor. **The equipment grounding conductor shall be identified in accordance with Section 250-119.** (ROP 2-23, TCC 2-23)



Ungrounded Conductor Identification—Multiwire Branch Circuits

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:34 2005

Application

Section 210-4 covers only multiwire branch circuits. Subsection 210-4(d) covers identification of conductors in multiwire branch circuits. The revision of 210-4(d) makes it clear that identification of ungrounded conductors is required in only multiwire branch circuits where there is more than one nominal voltage system in the building.

Although color coding of ungrounded conductors is a common industry practice, it is not required by the NEC. The marking required by this section could be color coding, tags, labels, or other effective means. Marking is not required for services, feeders or two-wire branch circuits. Marking is also not required for multiwire branch circuits if there is only one nominal voltage system in the building.

Background and Explanation

The term "multiwire branch circuit" was added to Section 210-4(d) to eliminate misinterpretation of this section. Section 210-4 covers the use of only multiwire branch circuits and 210-4(d) is one of the rules relating to that topic. When it is read out of context, the 1996 version of 210-4(d) seems to apply to all conductors. The revision should eliminate this misinterpretation.

Section 210-5 was revised to eliminate duplication of code text. Identification of grounding and grounded conductors was covered by Sections 210-5 and 310-12. The grounded conductor was also covered by Section 200-6 and the grounding conductor was covered by Section 250-57. The duplication of text has been eliminated by a series of changes leaving identification of grounded conductors in Section 200-6 and identification of grounding conductors covered by revised Section 250-119.

210-8 (a)(2) Accessory Building GFCI

Type of Change Revision

BRIEF SUMMARY

Residential. New wording clarifies which areas of residential accessory buildings are required to have GFCI protection for personnel.

Code Language

210-8. Ground-Fault Circuit-Interrupter Protection for Personnel.

•
•
•

(a) Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified below shall have ground-fault circuit-interrupter protection for personnel.

•
•
•

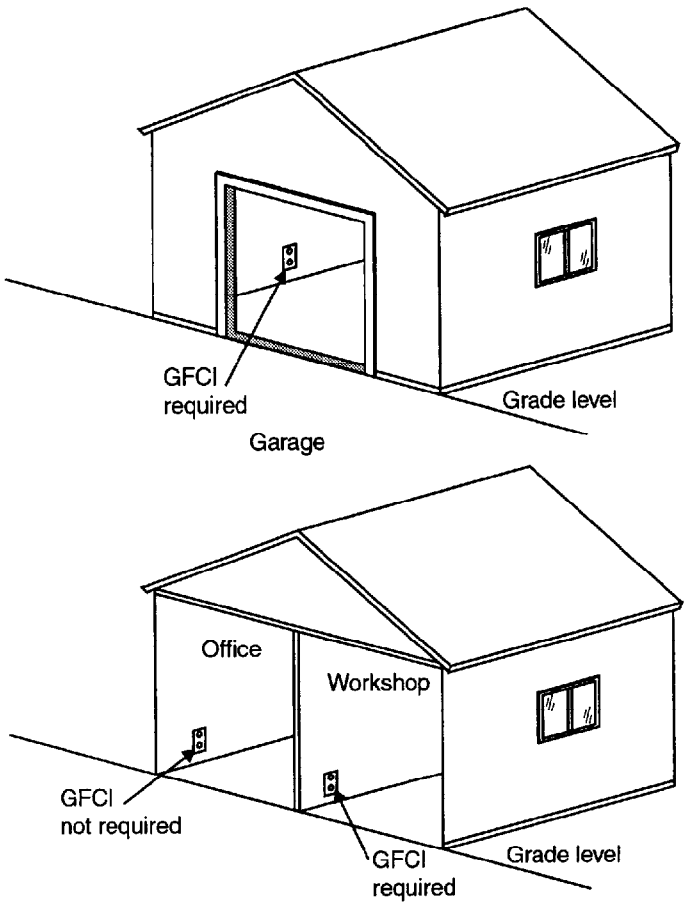
2. Garages, and **also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use.** (ROP 2-60)

Application

According to 210-8(a), the receptacles subject to this rule are only those rated 125 volt, single phase, 15 and 20 ampere. Such receptacles installed in residential accessory buildings are required to have GFCI protection for personnel if the receptacles are located in rooms that are both (1) at or below grade level, and (2) used for storage areas, work areas, or similar uses. The Exceptions exclude receptacles that are not readily accessible or that are located in spaces dedicated to specific cord-and-plug-connected appliances that are not easily moved.

The illustrations show that receptacles in garages are required to be GFCI protected. Also, the areas of other accessory buildings that are at grade level and used as storage or work areas are required to have GFCI protection. In the illustration the area on grade level that is finished and used as an office is not required to have GFCI protection. The area that is at grade level and used as a storage or work area is required to have GFCI protection for receptacles. Work areas are intended to be those areas where portable power tools and appliances are likely to be used.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:35 2005



GFCIs in Accessory Buildings

Background and Explanation

The locations of receptacles requiring GFCI protection in accessory buildings are similar to those locations in the main dwelling that are required to have GFCI protection. In fact, the new wording in 210-8(a)(2) is intended to clarify what was meant by "unfinished" in the 1996 NEC and is essentially the same as the description of basement areas requiring GFCI protection for receptacles in 210-8(a)(5). The Exceptions to both sections are identical.

In general, GFCI protection is required in areas that are likely to be damp or wet, areas where people are likely to be in contact with earth or other nonelectrical surfaces or equipment at ground potential, areas where portable power tools or appliances are likely to be used, or where extension cords are likely to be used to extend power into these areas. The intent of this change is to identify those areas.

210-8(a)(3) Exc. & (b)(2) Exc. Deicing Equipment GFCI Exceptions

Type of Change Revision; New Exception

BRIEF SUMMARY

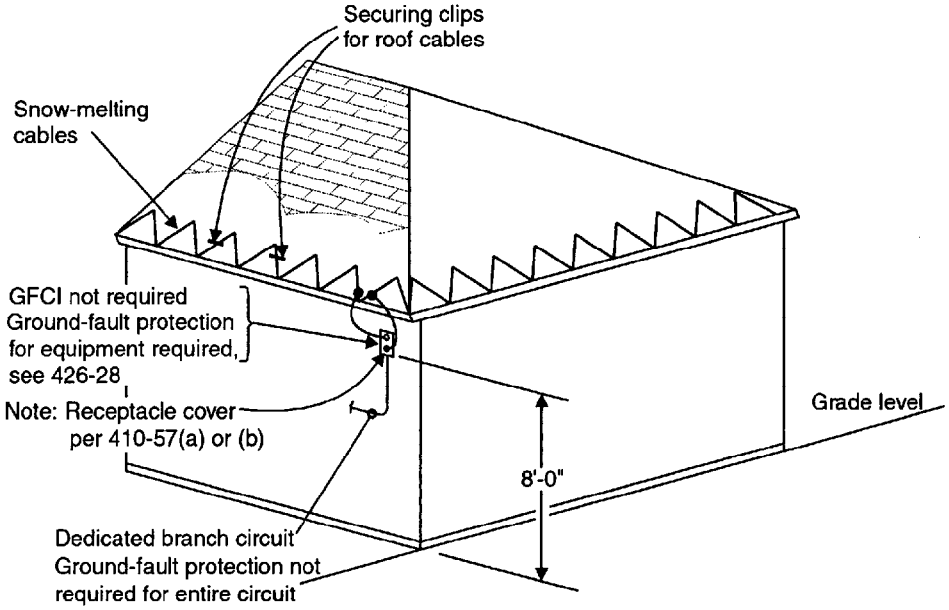
All installations. Exceptions are clarified and added to allow receptacles for snow melting and deicing to be installed without GFCI protection where ground-fault protection of the equipment is provided as specified by Section 426-28.

Code Language

210-8. Ground-Fault Circuit-Interrupter Protection for Personnel.

•
•
•

Exception: Receptacles that are not readily accessible and are supplied by a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed ***in accordance with the applicable provisions of Article 426.*** (ROP 2-67) (ROC 2-34)



Receptacles for Deicing and Snow Melting

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:35 2005

Application

Section 210-8(a)(3) applies to residential installations and Section 210-8(b)(2) applies to other than residential installations. Both sections cover 125-volt, single-phase, 15- and 20-ampere receptacles. Section 210-8(a)(3) requires such receptacles located outdoors on dwelling units to be GFCI protected. Section 210-8(b)(2) requires such receptacles installed on nondwelling rooftops to be GFCI protected. The exception to 210-8(a)(3) was revised to allow receptacles that are not readily accessible to omit GFCI protection where the receptacles are supplied by branch circuits dedicated to deicing and snow melting and the installation of the deicing and snow-melting equipment complies with the applicable provisions of Article 426. A new exception with identical wording allows similarly installed rooftop receptacles located on nondwelling occupancies to be installed without GFCI protection.

The illustration shows a dedicated circuit supplying a receptacle that is installed under the eave of a house to supply resistance-type deicing or snow-melting cables. GFCI protection for this receptacle is not required. An identical exception would apply if a receptacle supplying similar equipment were installed on a rooftop of a commercial building. Note, however, that the receptacle installed under the eave is made "not readily accessible" by mounting it so that it is out of normal reach. A receptacle on a rooftop may be considered readily accessible if a permanent roof access is provided. See the definition of "accessible, readily" in Article 100.

Background and Explanation

The primary purpose of this change is to make it clear that GFCI protection is not required for the receptacles that are not readily accessible and that are supplied by branch circuits dedicated to the electric deicing and snow-melting equipment. Section 426-28 requires ground-fault protection of equipment for resistance-type deicing and snow-melting equipment. This protection is permitted to be installed anywhere in the branch circuit or can be an integral component of the deicing and snow-melting equipment. GFCI protection is not usually suitable for such installations as the normal leakage currents may cause nuisance tripping. Where a 125-volt, single-phase, 15- or 20-ampere receptacle installed to supply this equipment is readily accessible and in a location covered by Sections 210-8(a)(2) or 210-8(b)(2), GFCI protection is required.

Wed Feb 02 02:30:35 2005

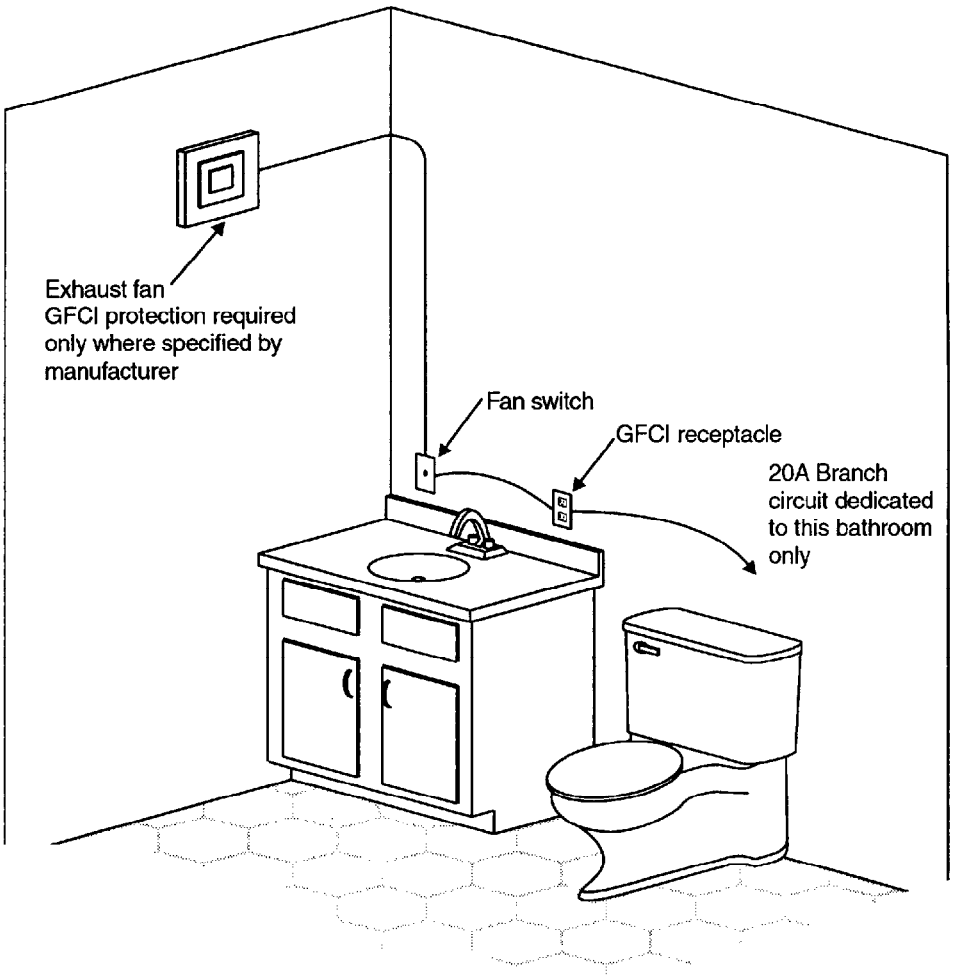
210-11(c)(3)

Exc. Relocated Requirements from 220-4 and 210-52

Type of Change New

BRIEF SUMMARY

Residential. Part of 210-52(d) was moved to 210-11(c)(3). A new exception allows the 20-ampere bathroom receptacle circuit to serve other equipment in the same bathroom if the circuit supplies only one bathroom.



Dedicated Circuits for Bathrooms

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:35 2005

Code Language

210-11. Branch Circuits Required.

•
•
•

(3) Bathroom Branch Circuits. **In addition to the number of branch circuits required by other parts of this section,** at least one 20-ampere branch circuit shall be provided to supply the bathroom receptacle outlet(s). Such circuits shall have no other outlets. (ROP 2-5) (ROC 2-93)

Exception: Where the 20-ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with Section 210-23(a). (ROP 2-191)

Application

The illustration shows an exhaust fan fed from the same 20-ampere circuit that feeds the bathroom receptacle. This installation is permitted under the 1999 NEC as long as no other bathroom is on the same circuit. The other equipment that may be supplied is subject to the limitations of Section 210-23(a). In this example, 210-23(a) would limit the fan load to no more than 50 percent of the rating of the branch circuit, or 10 amperes. If the bathroom circuit is used as shown, an additional circuit or circuits would be required for any additional bathrooms.

Background and Explanation

The 1996 NEC added a new requirement for 20-ampere branch circuits in bathrooms. These circuits were allowed to feed more than one bathroom but were required to be dedicated to bathroom receptacles. A proposal was made for the 1999 NEC to allow ventilation fans that are listed to require GFCI protection to be supplied from the same GFCI that protects the bathroom receptacles. In response, the code panel added an exception to allow any other outlets in the same bathroom to be on the same circuit, subject to the load limitations of Section 210-23(a) for 20-ampere circuits. The panel also added the requirement that if a bathroom receptacle circuit serves other outlets in a bathroom, the 20-ampere circuit must be dedicated to that bathroom.

210-12 Arc-Fault Circuit Interrupters

Type of Change New

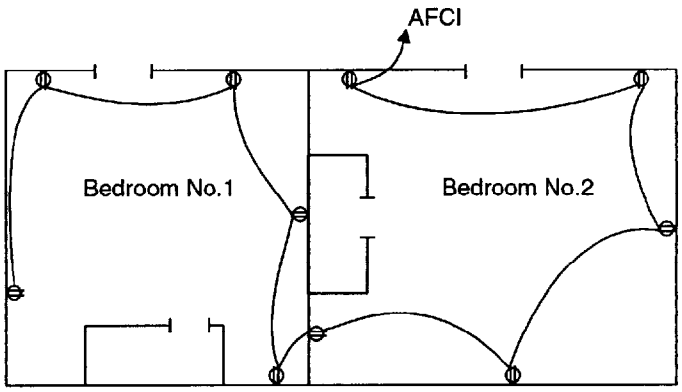
BRIEF SUMMARY

Residential. Requirements for the use of arc-fault circuit interrupter protection (AFCI) are introduced.

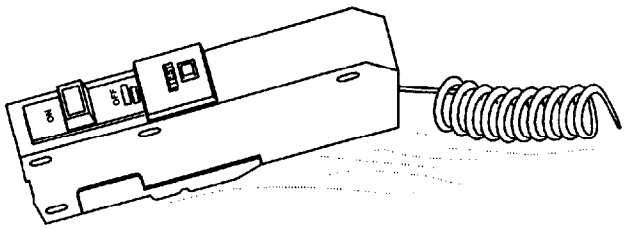
Code Language

210-12. Arc-Fault Circuit-Interrupter Protection.

(a) Definition. An *arc-fault circuit interrupter* is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.



Requirement becomes effective 1/1/02



AFCI Protection for Receptacle Circuits in Bedrooms of Dwelling Units

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:36 2005

(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002. (ROC 2-65)

Application

This new requirement has an effective date of January 1, 2002.

As seen in the definition, these new devices are able to recognize the unique characteristics of some types of arcing faults and will distinguish between abnormal arcing, such as series arcing or line to neutral faults, and normal arcing, such as in switches and motors. When abnormal arcing occurs in a circuit, these devices de-energize the entire circuit before excessive damage occurs. This protection will be provided for the entire branch-circuit and utilization equipment connected to it. Once this requirement becomes effective, AFCI protection will be required for 15- and 20-ampere, 125-volt receptacle circuits in dwelling unit bedrooms.

Background and Explanation

The effective date was established to allow time for the industry to make the devices available. The requirement for AFCI protection was limited to residential bedrooms to introduce this new technology on a gradual basis. The statistics provided to the committee indicated that many residential fires where the electrical system was determined to be the source of ignition originated in bedrooms.

210-19(a) Ampacity Adjustment and Correction Factors

Type of Change Relocation and Revision

BRIEF SUMMARY

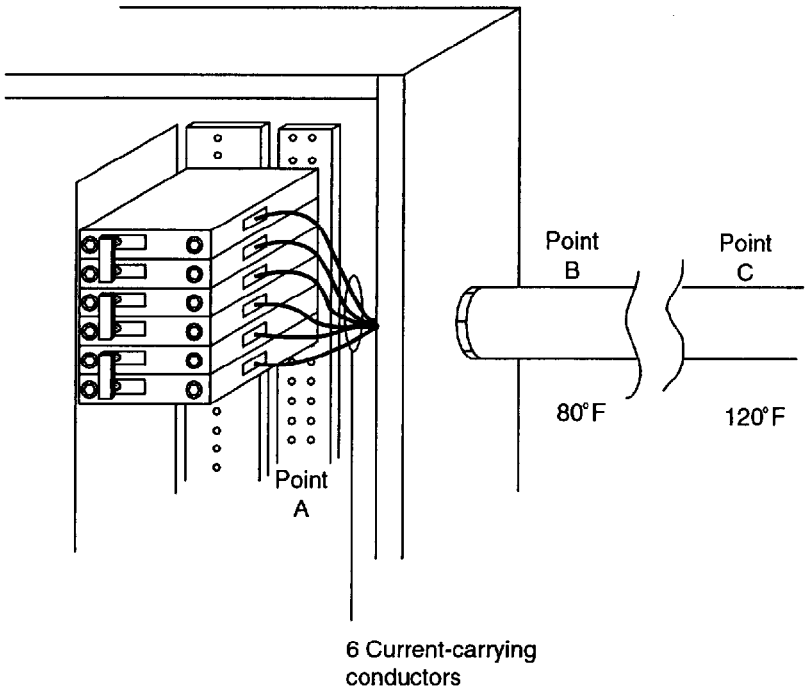
All installations. Wording is changed to clarify how conductors are to be selected for continuous and noncontinuous loads.

Code Language

210-19. Conductors—Minimum Ampacity and Size.

•
•
•

(a) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, **before the** application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load. (ROP 2-5, 2-143)



Conductors Supplying Continuous Loads

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:36 2005

Application

The illustration shows three different conditions for the conductors in the circuits shown. This example is based on the following conditions:

1. The circuit does not supply multiple receptacle outlets for cord- and plug-connected portable loads.
2. The load on each conductor is 16 amperes continuous and 16 amperes noncontinuous.
3. The conductors are copper with type THWN-Z insulation.

Conductor sizing at Point A must consider the termination provisions of the circuit breakers. A minimum conductor can be selected here "before" the conditions at Points B and C are considered.

The minimum conductor ampacity at Point A is found as follows:

> Minimum Ampacity for the load from 210-19(a):
> 16 A (noncontinuous) + 1.25 × 16A (continuous) = 16 + 20 = 36A

The minimum conductor size at Point A is found as follows (based on equipment marking):

> Terminal temperature rating from 110-14(c) = 60°C
> Smallest conductor from the 60°C column with an ampacity of at least 36A is No.8 AWG

Therefore, the minimum conductor size at Point A is No.8 AWG, which has an ampacity of 40A "before the application of any adjustment factors."

Because 110-14(c) says we must select an ampacity with the terminal temperature in mind, the minimum copper conductor size for the load is No. 8 AWG. We cannot use the 40A ampacity for a No. 10 from the 90°C column because the overcurrent device is not designed for the increased terminal temperatures associated with the use of the higher conductor ampacities. Note that 110-14(c) does not provide an adjustment factor, it is a rule about conductor ampacity selection relative to the terminal temperature rating.

Although the steps we have taken so far are sufficient to satisfy the requirements of 210-19(a), the conditions at Points B and C must still be considered in the final selection of a conductor size. At these two points, the ampacity must be adjusted for the ambient temperature that exceeds 30°C (86°F) and for more than three current carrying conductors in the raceway (310-15(b)(2)a). These ampacities can be determined using Section 310-15 as follows:

> Ampacity of a No.8 THWN-2 at 90°C from Table 310-16 = 55A
> Temperature correction factor at Point B = 1.00 (80°F, 90°C Column)
> Temperature correction factor at Point C = 0.82 (120°F, 90°C Column)
> Derating factor for six conductors in a raceway = 0.80

Using the factors determined above, we note that the No.8 conductor ampacities are

> 55A × 1.00 × 0.80 = 44A at Point B
> 55A × 0.82 × 0.80 = 36A at Point C

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:37 2005

According to 310-15(a)(2), because we have more than one ampacity that applies to the same circuit, the lowest ampacity must be used. We have found that the No.8 conductor has three applicable ampacities in this illustration: 40A at Point A, 44A at Point B, and 36A at Point C. Therefore, we select the 36A ampacity for the entire circuit. This ampacity must be adequate for the load. We also found that the minimum ampacity of the conductors to comply with 210-19(a) was 36A.

Finally, the overcurrent device size must be determined. The minimum size overcurrent device for a branch circuit supplying continuous and noncontinuous loads is given by 210-20(a). This rule requires the overcurrent protection to be not less than 125 percent of the continuous load plus 100 percent of the noncontinuous load. Because this example is based on the use of a circuit breaker installed in a panelboard, similar provisions of Section 384-16(d) also apply. This size matches the minimum ampacity of the conductors at Point A: 36A. Because 36 A is not a standard size according to Section 240-6 and the circuit is not a multioutlet circuit-supplying receptacle, Section 240-3(b) allows us to select the next larger size, 40A.

Let us summarize the requirements:

210-19(a)—Minimum ampacity for the branch circuit load : 36A
210-20(a)—Minimum overcurrent device for the load: 36A
310-15—Ampacity of No.8 conductors (lowest from Point C): 36A
240-3(b)—Maximum overcurrent device size: 40A
110-14(c)—Maximum ampacity of No.8 based on terminals: 40A

When we correlate the requirements listed here, we see that the minimum size conductors for this example would be No.8 with the specified THWN-2 insulation or an equivalent 90°C rated insulation. The maximum rating of the overcurrent device would be 40 amperes.

Background and Explanation

The relocation of this rule from 210-22(c) and 220-3(a) was discussed as part of the reorganization of Articles 210 and 220. The application of the rule has not changed from the 1996 NEC. Ampacity adjustments must be made for elevated ambient temperature and for more than three current-carrying conductors in a raceway. The wording change is meant to clarify that the adjustment factors need not be applied to conductor ampacities for the purpose of selecting a minimum size conductor to comply with 210-19(a). The ampacity adjustments still apply, but the selection of a minimum size conductor may be done "before" making the adjustments. The previous use of the word "without" led some code users to believe that the adjustment factors could be disregarded altogether as long as the conductor sizing was adequate for continuous and noncontinuous loads.

Selection of a conductor size involves more than one rule. The minimum conductor size determined under 210-19 is concerned with the application of a conductor to an overcurrent device. Similarly, the rules of 110-14(c) require ampacity selection to take into account the terminal temperature ratings at overcurrent devices as well as at utilization equipment terminals. These two rules must be coordinated with the ampacity selection covered by 310-15 and the overcurrent device selection covered by 240-3.

An identical wording change was made in the rules for sizing feeders in Section 215-2(a).

210-23(a) Lighting Fixture Loads on Branch Circuits

Type of Change Revision

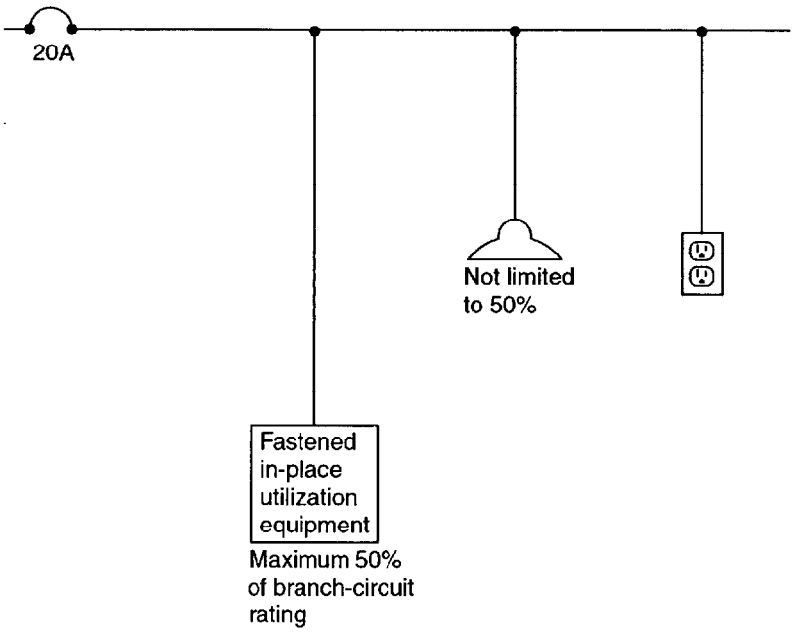
BRIEF SUMMARY

All occupancies. Loading restrictions on 15- and 20-ampere branch circuits are clarified.

Code Language

210-23. Permissible Loads.

(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both. The rating of any one cord- and plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating. The total rating of utilization equipment fastened in place, **other than lighting fixtures,** shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied. (ROP 2-146) (ROC 2-105)



Fixed Lighting Loads on 15- or 20-Ampere Multioutlet Branch Circuits

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:37 2005

Application

Section 210-23 requires branch circuits that supply more than one outlet to comply with 210-23(a) through (d). Section 210-23(a) limits the rating of any single cord- and plug-connected appliance to 80 percent of the circuit rating.

The rating of equipment fastened in place, other than lighting, must not exceed 50 percent where the circuit also supplies cord- and plug-connected equipment.

Background and Explanation

The revised wording makes it clear that lighting units fastened in place are not limited to 50 percent of the branch-circuit rating. This rule typically applies where an appliance that is fastened in place is connected to a general lighting circuit that also supplies convenience receptacles. The submitter of the proposal indicated that the rule was being interpreted to limit fixed lighting to 50 percent of the branch-circuit rating.

210-52(b)(3) Small-Appliance Circuits—Multiple Kitchens

Type of Change Revision

BRIEF SUMMARY

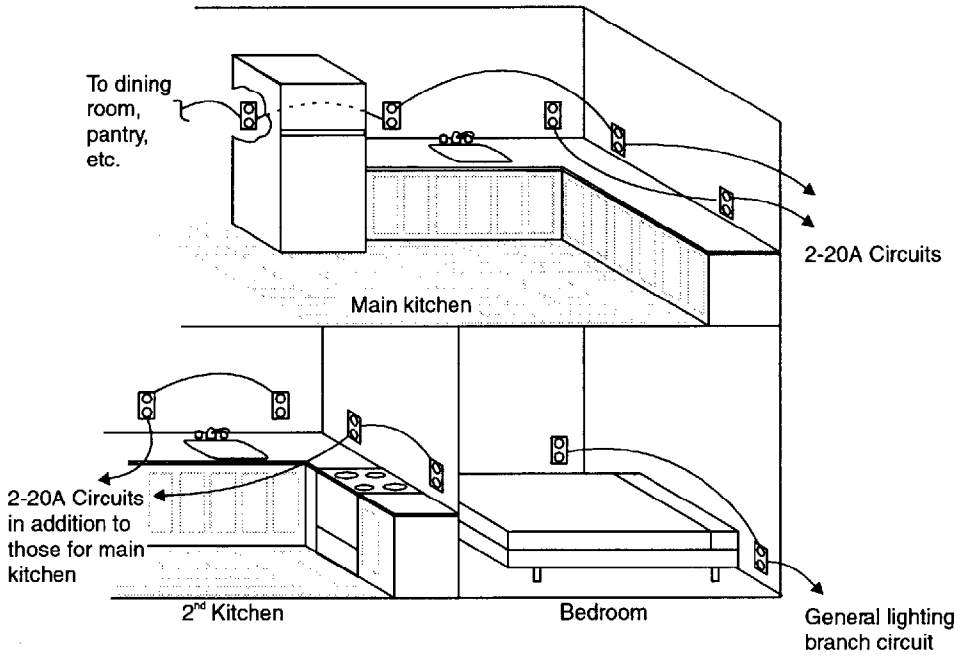
Residential. Each kitchen must be supplied by at least two small-appliance branch circuits and any such circuit may serve only one kitchen.

Code Language

210-52. Dwelling Unit Receptacle Outlets.

•
•
•

(3) Receptacles installed in a kitchen to serve countertop surfaces shall be supplied by not less than two small-appliance branch circuits, either or both of which shall also be permitted to supply receptacle outlets in the **same** kitchen and in other rooms specified in Section 210-52(b)(1). Additional small-appliance branch circuits shall be permitted to supply receptacle outlets in the kitchen and other rooms specified in Section 210-52(b)(1). **No small-appliance branch circuit shall serve more than one kitchen.** (ROP 2-174)



Circuits for More Than One Kitchen

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:37 2005

Application

Where a residence has more than one kitchen, each kitchen must have a minimum of two 20-ampere branch circuits to supply countertop receptacles. Although the small appliance circuits may serve other rooms listed in 210-52(b)(1), no small-appliance branch circuit may serve more than one kitchen. Additional small-appliance branch circuits may be used, but only two are required for each kitchen.

The illustration shows a dwelling unit with two kitchens. Each kitchen is shown with two small-appliance branch circuits. Other rooms are fed by general lighting circuits. The receptacle outlets in the dining room, pantry, breakfast nook, or similar area are required to be supplied by at least one small-appliance branch circuit, which can be one of the circuits that supplies the kitchen receptacles.

Background and Explanation

Some dwelling units have more than one kitchen. Dwelling units that have more than one kitchen may have both kitchens in use at the same time. Such use could easily result in overloading of the kitchen circuits if these circuits are shared by more than one kitchen. This change requires each kitchen to be treated individually.

210-52(c)(5) Exc. Island and Peninsula Receptacle Outlets

Type of Change Revision

BRIEF SUMMARY

Dwelling units. This revision clarifies where receptacles serving the countertop may be located below the countertop.

Code Language

210-52. Dwelling Unit Receptacle Outlets.

•
•
•

(c) Countertops. In kitchens and dining rooms of dwelling units, receptacle outlets for counter spaces shall be installed in accordance with (1) through (5).

•
•
•

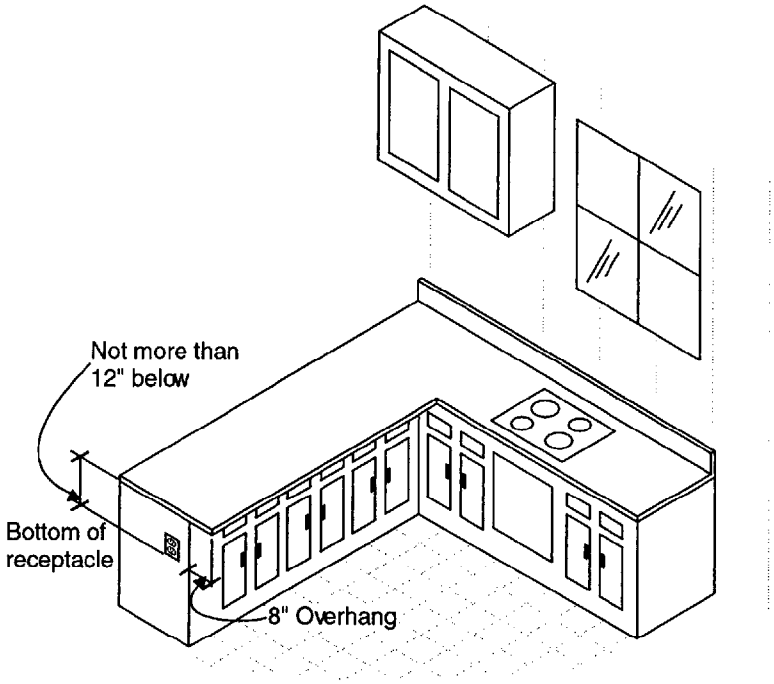
(5) Receptacle Outlet Location. Receptacle outlets shall be located **above, but** not more than 18 in. (458 mm) above the countertop. Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops. Receptacle outlets rendered not readily accessible by appliances fastened in place or appliances occupying dedicated space shall not be considered as these required outlets. (ROP 2-186)

Exception: ~~*Where acceptable to the Authority having jurisdiction and*~~ *To comply with the* ~~*special*~~ *conditions as specified in a. or b., receptacle outlets shall be permitted to be mounted not more than 12 in. (305 mm) below the countertop. Receptacles mounted below the countertop in accordance with this exception shall not be located where the countertop extends more than 6 in. (153 mm) beyond its support base.*

a. Construction for the physically impaired

b. On island and peninsular countertops ***where the countertop is flat across its entire surface (no backsplashes, dividers, etc.) and there are no means to mount a receptacle within 18 in. (458 mm) above the countertop, such as an overhead cabinet*** (ROP 2-186) (ROC 2-116)

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:38 2005



Island and Peninsula Countertop Receptacles

Application

Many island or peninsular countertops are flat across the entire surface. As a result it may be difficult to locate a receptacle above the counter. Where there are cabinets located not more than 18 inches above the island or peninsular counter, the receptacles must be mounted on (surface or flush) the overhead cabinets. If a backsplash is installed on the counter, the receptacle must be installed in or on the backsplash. In other installations the receptacle may be installed below the countertop in compliance with the exception. Note that the receptacle cannot be located below the 8-inch overhang that is shown in the illustration.

Background and Explanation

This section was revised to make it clear that the preferred location for receptacles is above the countertop. One concern with receptacles below the countertop is that children may pull cooking appliances off the counter. This section now recognizes this hazard by requiring receptacles to be located above the counter where practical. It now also recognizes that some installations do not allow for practical mounting above the counter.

Wed Feb 02 02:30:38 2005

210-52(d) Bathroom Receptacle Outlets and Circuits

Type of Change Revision

BRIEF SUMMARY

Dwelling units. Requirement for receptacle outlets in bathrooms is clarified.

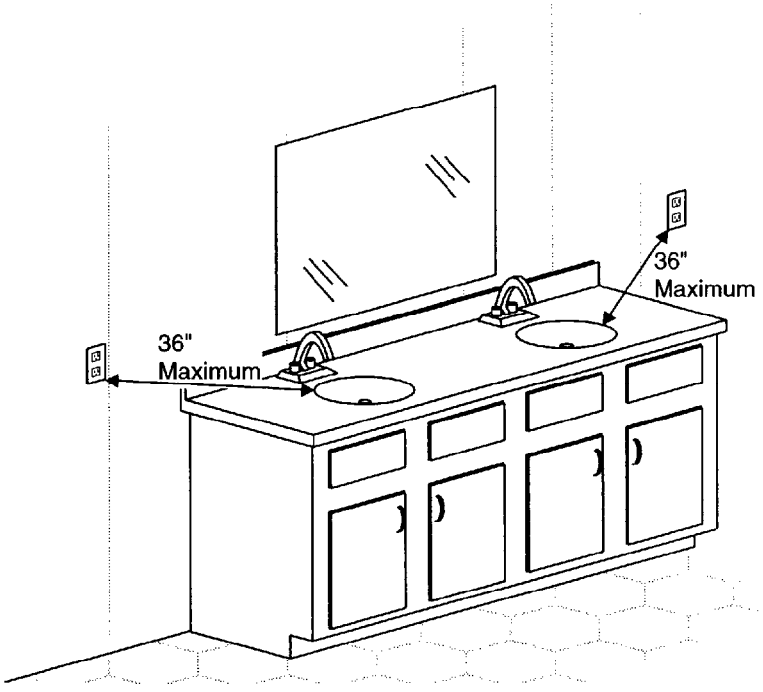
Code Language

210-52. Dwelling Unit Receptacle Outlets.

•
•
•

(d) Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms ~~adjacent to~~ **within 36 in. (914 mm) of the outside edge of** each basin. **The receptacle outlet shall be located on a wall that is adjacent to the basin location.** See Section 210-8(a)(1). (ROP 2-195) (ROC 2-123)

Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops in a bathroom basin location.



Bathroom Receptacle Location

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:38 2005

Application

Revised wording requires bathroom receptacles to be located within 36 inches of the basin. The 36-inch distance is to be measured from the edge of the basin. By changing the wording relative to the wall on which the receptacle is to be located, the committee clearly intends that receptacles be installed so that appliance cords in a bathroom will not present a tripping hazard. One receptacle outlet that is within 36 inches of each basin will meet this requirement.

Background and Explanation

The 1996 NEC required the receptacle to be located adjacent to the basin. Adjacent was considered by the code panel to be a vague and unenforceable term. The new wording clarifies what distance is required, how the measurement is to be made, and the wall space that is to be used. A receptacle located on a wall behind a person who is facing the basin does not satisfy the revised rule.

Wed Feb 02 02:30:38 2005

210-52(g) Unfinished Basement Receptacle

Type of Change Revision

BRIEF SUMMARY

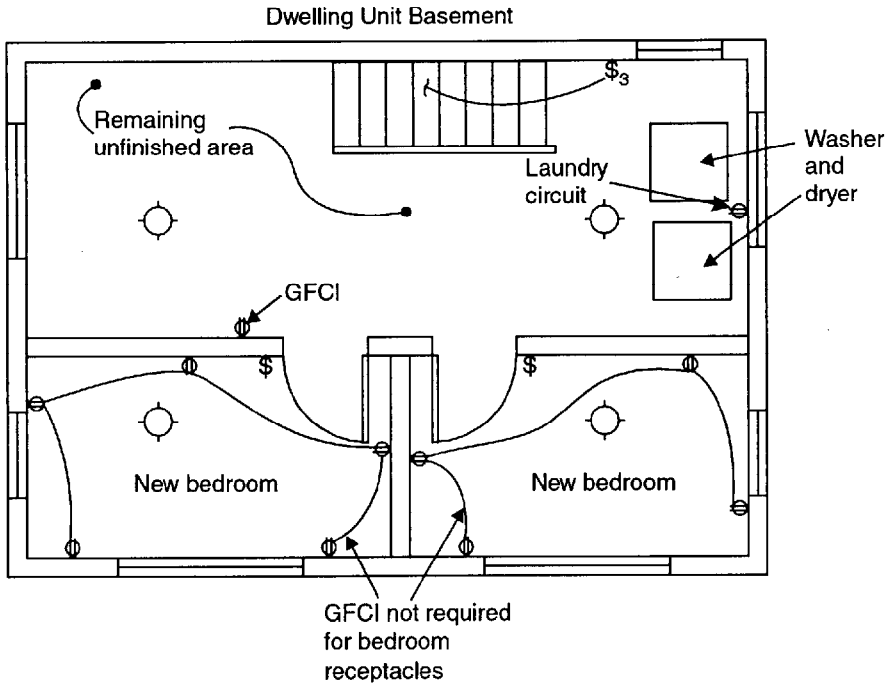
Residential. Partially finished basements are required to have a GFCI-protected receptacle in the unfinished portion.

Code Language

210-52. Dwelling Unit Receptacle Outlets.

•
•
•

(g) Basements and Garages. For a one-family dwelling, at least one receptacle outlet, in addition to any provided for laundry equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See Sections 210-8(a)(2) and (a)(5). **Where a portion of the basement is finished into a habitable room(s), the receptacle outlet required by this section shall be installed in the unfinished portion.** (ROP 2-211) (ROC 2-128, 2-129)



GFCIs in Partially Finished Basements

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:39 2005

Application

The illustration shows a basement that has been partially finished into bedrooms. The locations of receptacles, switches, and lighting outlets for the new bedrooms are dictated by Sections 210-52 and 210-70. Even though there are now receptacles in the basement bedrooms, these receptacles are not required to have GFCI protection. The code requires that a receptacle outlet be installed in the unfinished portion of the basement, and Section 210-8(a)(5) requires such outlets to be GFCI protected. Section 210-8(a)(5) also defines "unfinished basements" as "portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like."

Background and Explanation

When an unfinished basement is partially finished, the remaining portion of the basement is likely to continue to be used as storage and work areas. However, unless specifically required by Section 210-8(a), the receptacles installed in the newly finished areas are not required to have GFCI protection. The intent of Sections 210-52(g) and 210-8(a)(5) is to provide GFCI protection for persons using cord- and plug-connected appliances in the unfinished areas. Without the new provision of Section 210-52(g), users would likely extend cords from the non-GFCI-protected receptacles in the finished areas into the unfinished areas. The requirement to install a receptacle outlet in the unfinished portion ensures that the intended GFCI protection will still be provided for the unfinished area.

Wed Feb 02 02:30:39 2005

210-60(b) Hotel/Motel Receptacle Outlets

Type of Change Revision

BRIEF SUMMARY

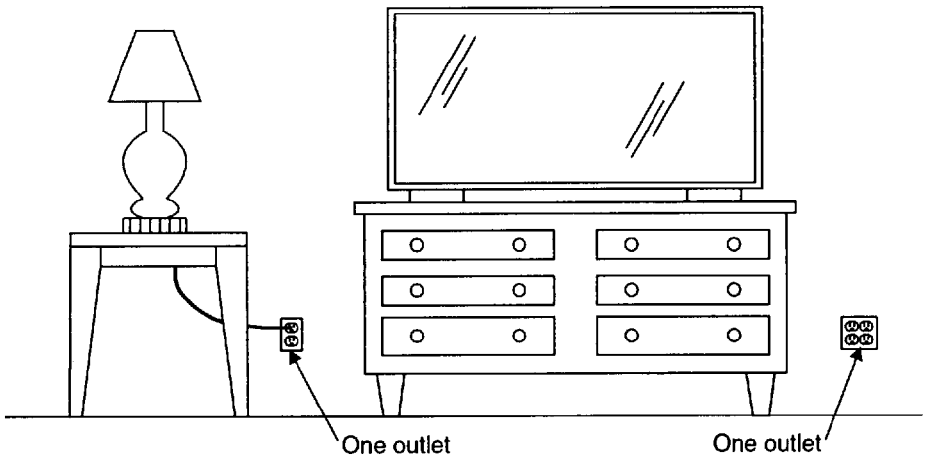
Hotels and motels. Receptacle placement in guest rooms is clarified.

Code Language

210-60. Guest Rooms.

(a) General. Guest rooms in hotels, motels, and similar occupancies shall have receptacle outlets installed in accordance with Section 210-52. See Section 210-8(b)(1).

(b) Receptacle Placement. In applying the provisions of Section 210-52(a), the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section. These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. ~~and readily accessible~~. **At least two receptacle outlets shall be readily accessible. Where receptacles are installed behind the bed, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed, or the receptacle shall be provided with a suitable guard.** (ROP 2-218, 2-219)



Readily Accessible Receptacles in Hotel and Motel Guest Rooms

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:39 2005

Application

In each hotel and motel guest room, at least two receptacle outlets must be readily accessible. "Ready access" is defined, in part, as capable of being reached quickly without the removal of obstacles. At least two receptacle outlets must be accessible to the occupant of the guest room without the moving of furniture. To prevent damage to attachment caps and cords, receptacle outlets installed behind beds are required to be located so that the bed will not contact attachment plugs connected to the outlet or guards must be installed on receptacle outlets.

Background and Explanation

The exception to Section 210-60 in the 1996 edition of the NEC required all guest room receptacles to be readily accessible. This requirement was considered to be excessive since some receptacles are installed for dedicated equipment. Two readily accessible outlets are considered to be adequate to allow the hotel guest to connect portable equipment. The requirement for location or guards for receptacles behind beds is intended to reduce the fire hazard created where attachment caps and cords are damaged and bedding may come into contact with exposed live or arcing parts.

NEC pp. 45–46

210-70(a) & (c) Required Lighting Outlets

Type of Change Revision

BRIEF SUMMARY

Residential and equipment spaces. Section 210-70(a) was revised to clarify requirements in dwellings. Section 210-70(c) was revised to clarify the requirements for servicing equipment in attics and underfloor spaces and the permitted uses of fixtures with integral switches in such spaces.

Code Language

210-70. Lighting Outlets Required.

•
•
•

(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room **and bathroom**. (ROP 2-237) (ROC 2-136)

Exception No. 1: In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets. (ROP 2-237)

Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.

(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet **containing a switch or controlled by a wall switch** shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing. (ROP 2-237)

(c) Other Locations. For attics and underfloor spaces containing equipment requiring servicing, such as heating, air-conditioning, and refrigeration equipment, at least one lighting outlet **containing a switch or controlled by a wall switch** shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing. (ROP 2-237)

Application

The basic requirements for dwelling units have not changed. The rules have been reorganized and grouped for easier use. Section 210-70(a) is now divided into three parts: (1) Habitable Rooms, (2) Additional Locations, and (3) Storage or Equipment Spaces. The table illustration summarizes where lighting outlets are required and what types of lighting outlets are permitted.

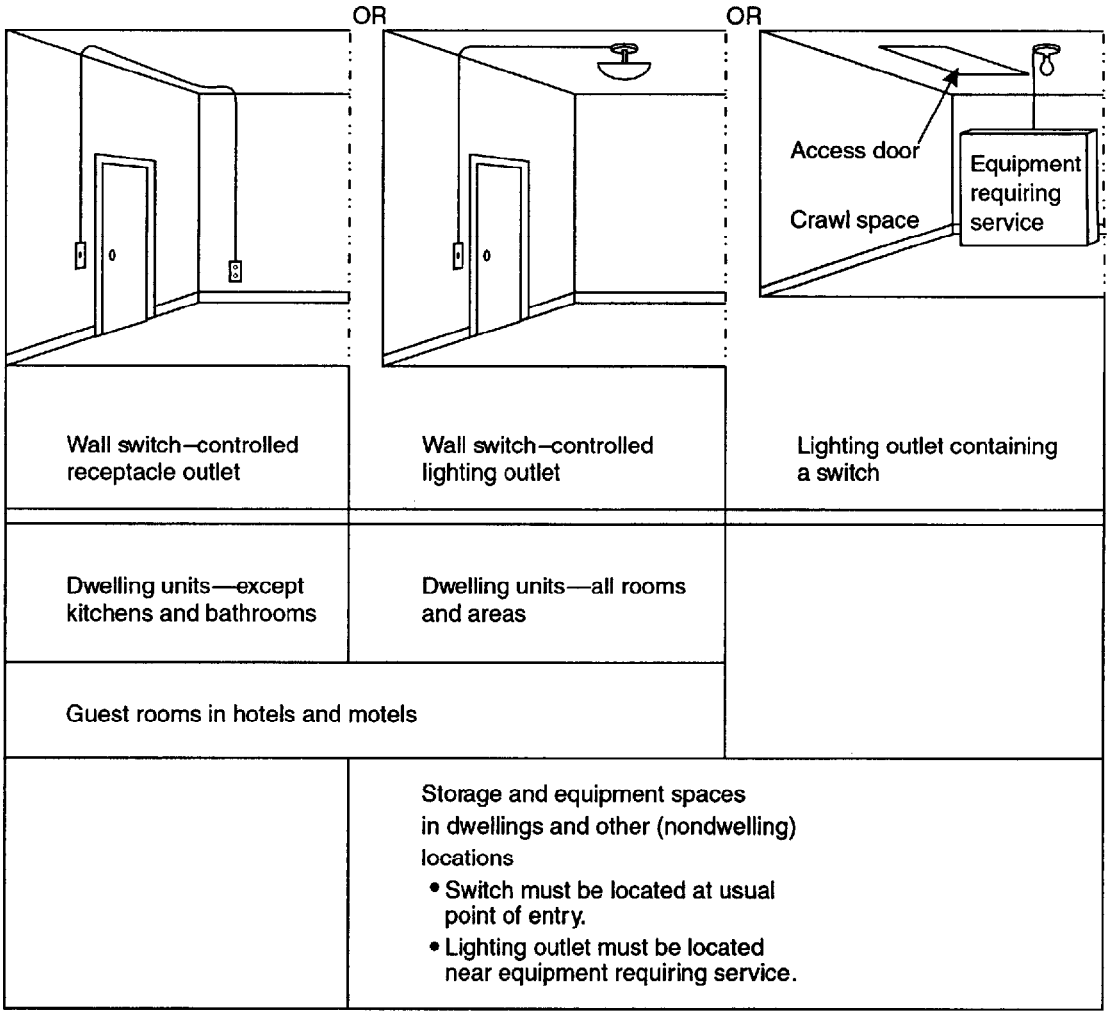
Copyright by the National Fire Protection Association
Wed Feb 02 02:30:40 2005

Habitable rooms are required to have a wall switch-controlled lighting outlet. A switched receptacle(s) in other than kitchens and bathrooms is permitted.

Additional locations where at least one wall switch-controlled lighting outlet is required include hallways, stairways, attached garages, and exterior entrances and exits. These locations require wall switch controlled-lighting outlets, although central controls are permitted for hallways, stairways, and outdoor entrances. Lighting outlets in stairways with six steps or more are still required to have controls at each floor level.

Storage and equipment spaces are required to have lighting outlets, but the switching may be provided by wall switches or as switches that are part of a lighting outlet. The lighting control must be provided near the "usual point of entry" and lighting fixtures must be located at or near the equipment requiring servicing. These revisions clearly permit a fixture containing a switch to be used if it is near both the equipment and the point of entry.

Attics and underfloor spaces in other than dwelling units that contain equipment requiring servicing are required to have lighting outlets. The rules for these spaces are similar to storage and equipment spaces in dwelling units as covered here. However, this requirement applies only to attic and underfloor spaces containing equipment that will require servicing or maintenance.



Required Lighting Outlets and Types Permitted

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:40 2005

Background and Explanation

The changes to Section 210-70 were made primarily to improve usability. The exceptions in this section have been relocated so that they immediately follow the rules they modify. The primary change in this section is to clarify the location of switches and fixtures in equipment spaces and to clarify that a fixture or lampholder with an integral switch is permitted in storage and equipment spaces in all occupancies.

Wed Feb 02 02:30:40 2005

NEC pp. 46–47

215-2 & 215-3 Reorganization and Relocation of Requirements

Type of Change Reorganization

BRIEF SUMMARY

All installations. Article 215 was reorganized to include material relocated from Article 220.

Code Language

See table.

Article 215 Reorganization

1996 NEC Section	*Section Heading or Description*	*1999 NEC Section*
215-2	Minimum Rating and Size	215-2
220-10(b) (part)	General	215-2(a)
215-2(a)	For Specified Circuits	215-2(b)
215-2(b)	Ampacity Relative to Service Entrance Conductors	215-2(c)
215-2 (part)	Individual Dwelling Unit or Mobile Home Conductors	215-2(d)
220-10(b) (part)	Overcurrent Protection	215-3

Application

Article 215 provides requirements for feeders. Feeder sizes and loads are determined by calculations of the branch circuits they supply. The calculations for feeders are to be done in accordance with Part B of Article 220. A listing of the sections that were relocated by this change is given in the table. This reorganization did not result in any substantive changes to the way feeders are sized or installed.

Background and Explanation

This change was made as part of the effort to improve the usability of the code. Section 220-10(b) contained two rules about feeder conductor and overcurrent device sizing that were not directly related to the feeder calculation. Former Section 220-10(b) was divided into two parts and incorporated into Sections 215-2 and 215-3. Section 215-2 was renumbered to accommodate the additional text from Article 220. This change groups the basic requirements for feeder sizing and overcurrent protection into one location.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:40 2005

215-10 Excs. 1 & 2 GFPE for Feeders

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Exceptions to requirements for ground-fault protection of equipment for feeder disconnects have been added.

Code Language

215-10. Ground-Fault Protection of Equipment. **Each** feeder disconnect rated 1000 amperes or more **and installed on** solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase, shall be provided with ground-fault protection of equipment **in accordance with the provisions of Section 230-95.** (ROP 2-267)

Exception No. 1: The provisions of this section shall not apply to a disconnecting means for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards. (ROP 2-267)

Exception No. 2: The provisions of this section shall not apply to fire pumps. (ROP 2-267)

Exception No. 3: The provisions of this section shall not apply if ground-fault protection of equipment is provided on the supply side of the feeder. (ROP 2-267)

Application

Ground-fault protection of equipment is required for each feeder disconnecting means rated 1000 amperes or higher and installed in solidly grounded wye distribution systems of over 150 volts to ground and not exceeding 600 volts phase to phase, unless exempted by one of the three exceptions. Installation of the GFPE device may be omitted for some continuous industrial processes, fire pumps, and where the required protection is installed on the supply side of the feeder other than as required by Section 517-17 for health-care facilities.

Background and Explanation

Exceptions 1 and 2 were added to clarify where ground-fault protection may be omitted from feeder disconnects rated 1000 amperes or higher. This revised text directly correlates with similar requirements for service disconnecting means found in Section 230-95.

Table 220-3(b) *Note	General use receptacles in dwellings and guest rooms of hotels and motels	220-3(b)(10)
Table 220-3(b)	General Lighting Loads by Occupancies	Table 220-3(a)
210-22	Maximum Loads	220-4
210-22(a)	Motor-Operated and Combination Loads	220-4(a)
210-22(b)	Inductive Lighting Loads	220-4(b)
210-22(c) (part)	Range Loads	220-4(c)

Application

Article 220 is the base for all load calculations covered by the NEC. The major difference in the use of Article 220 in the 1999 NEC will be in the use of Section 220-3. Section 220-3(b) is now Section 220-3(a), and Section 220-3(c) is now Section 220-3(b). Exceptions to Section 220-3(c) are now incorporated into the rules

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:41 2005

of Section 220-3(b). Also, the former rules of Section 220-4, which did not involve calculations, were moved to Article 210 and replaced by text that was in Section 210-22, "Maximum Loads." A complete listing of the sections that were relocated is given in the table.

Article 220 is now used only to compute branch-circuit, feeder, and service loads. Once the load is determined, the provisions of Articles 210, 215, 230, 240, and 310 can be used to size conductors and determine overcurrent device ratings. Article 220 will direct the user to other sections where specific rules apply to loads, such as motors or air conditioning equipment.

Background and Explanation

This change was made to transform Article 220 into an article that is exclusively about calculations as the title of the article implies. Sections that were not part of load calculations were moved to Articles 210 and 215. The basic organization of the Parts of Article 220 remain the same. Part A, "General," covers branch circuit calculations and forms the basis for Part B, "Feeders and Services." Parts C and D are "Optional Calculations for Computing Feeder and Service Loads" and "Method for Computing Farm Loads," respectively.

220-2 Fraction of Ampere Calculation

Type of Change

Revision and Relocation

BRIEF SUMMARY

All installations. The rule regarding fractions of an ampere was relocated from Chapter 9 examples and the examples are moved to new Appendix D.

Code Language

See flow chart.

Application

The examples in Chapter 9 along with the examples from Articles 550 and 552 are now in Appendix D. Appendix D is not a part of the mandatory rules of the code, but one small part of the examples was still needed. That part, on the proper way to deal with fractions of an ampere, was relocated to Section 220-2 so that it would remain as part of the code. The illustration shows the origin and destination of the examples and the fractions of an ampere rule.

Section 220-2(a) now contains what used to be 220-2 and covers nominal voltages for use in calculations. Section 220-2(b) contains the permission to drop minor fractions from calculations.

Background and Explanation

Although the examples have long been a part of Chapter 9, Chapter 9 is a part of the code as outlined in Section 90-2. The examples are meant to be just that, examples. They do not represent the only correct approach to the given problems. However, the placement of the examples in Chapter 9 caused some confusion. For instance, some licensing exams have included test problems that were modeled on the examples, and any approach other than that taken in the examples may have been considered incorrect. The examples are more properly placed in the new Appendix D where they are clearly for reference and are less likely to be misinterpreted as mandatory calculation methods.

220-3 Load Requirements

Type of Change Revision

BRIEF SUMMARY

All occupancies. Extensive revision clarifies load calculation requirements.

Code Language

220-3. Computation of Branch Circuit Loads. Branch-circuit loads shall be computed as shown in (a) through **(c)**.

~~(a) Continuous and Noncontinuous Loads.~~ [Moved to Section 210-20(a)]

~~(b)~~**(a) Lighting Load for Specified Occupancies.** A unit load of not less than that specified in Table 220-3**(a)** ~~(b)~~ for occupancies specified therein shall constitute the minimum lighting load for each square foot (0.093 m^2) of floor area. . . .

FPN: The unit values herein are based on minimum load conditions and 100 percent power factor, and may not provide sufficient capacity for the installation contemplated.

(b) Other Loads—All Occupancies. In all occupancies, the minimum load for each outlet for general-use receptacles and outlets not used for general illumination shall not be less than **that computed in (1) through (11)**, the loads shown being based on nominal branch-circuit voltages. (ROP 2-5) (ROC 2-4)

Exception ~~No. 4~~: The loads of outlets serving switchboards and switching frames in telephone exchanges shall be waived from the computations. (ROP 2-5)

(1) **Specific Appliances or Loads.** An outlet for a specific appliance or other load not covered in **(2) through (11) shall be computed based on the** ampere rating of the appliance or load served. (ROP 2-5)

(2) **Electric Dryers and Household Electric Cooking Appliances. Load computations shall be permitted as specified in Section 220-18 for electric dryers and Section 220-19 for electric ranges and other cooking appliances.** (ROP 2-5)

(3) Motor Loads. Outlets for motor loads shall be computed in accordance with the requirements in Sections 430-22 and 430-24 and Article 440. (ROP 2-5)

(4) Recessed Lighting Fixtures. An outlet supplying recessed lighting fixture(s) shall be **computed based on** the maximum volt-ampere rating of the equipment and lamps for which the fixture(s) is rated. (ROP 2-5)

(5) Heavy Duty Lampholders. Outlets for heavy-duty lampholders shall be computed at a minimum of 600 volt-amperes. (ROP 2-5) (ROP 2-285)

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:42 2005

(6) Sign and Outline Lighting. Sign and outline lighting outlets shall be computed at a minimum of 1200 volt-amperes for each required branch circuit specified in Section 600-5(a). (ROP 2-5) (ROC 2-153)

(7) Show Windows. Show windows shall be computed in accordance with either (a) or (b).

(a) The unit load per outlet as required in other provisions of this section

(b) At 200 volt-amperes per linear foot of show window (ROP 2-5) (ROC 2-4)

(8) Fixed Multioutlet Assemblies. Fixed multioutlet assemblies used in other than dwelling units or the guest rooms of hotels or motels shall be computed in accordance with (a) or (b). (ROP 2-5)

(a) Where appliances are unlikely to be used simultaneously, each 5 ft (1.52 m) or fraction thereof of each separate and continuous length shall be considered as one outlet of not less than 180 volt-amperes. (ROP 2-5)

(b) Where appliances are likely to be used simultaneously, each 1 ft (305 mm) or fraction thereof shall be considered as an outlet of not less than 180 volt-amperes. (ROP 2-5)

(9) Receptacle Outlets. Except as covered in (10), receptacle outlets shall be computed at not less than 180 volt-amperes for each single or for each multiple receptacle on one strap. A single piece of equipment consisting of a multiple receptacle comprised of four or more receptacles shall be computed at not less than 90 volt-amperes per receptacle.

This provision shall not be applicable to the receptacle outlets specified in Sections 210-11(c)(1) and (2). (ROC 2-4)

(10) Dwelling Occupancies. In one-family, two-family, and multifamily dwellings and in guest rooms of hotels and motels, the outlets specified in (a), (b), and (c) are included in the general lighting load calculations of Section 220-3(a). No additional load calculations shall be required for such outlets.

(a) All general-use receptacle outlets of 20-ampere rating or less, including receptacles connected to the circuits in Section 210-11(c)(3)

(b) The receptacle outlets specified in Sections 210-52(e) and 210-52(g)

(c) The lighting outlets specified in Section 210-70(a) and (b)

(11) Other Outlets. Other outlets not covered in (1) through (10) shall be computed based on 180 volt-amperes per outlet. (ROC 2-4)

(c) Loads for Additions to Existing Installations. (ROP 2-5)

(1) Dwelling Units. Loads for structural additions to an existing dwelling unit or to a previously unwired portion of an existing dwelling unit, either of which exceeds 500 ft^2 (46.5 m^2), shall be computed in accordance with (b). Loads for new circuits or extended circuits in previously wired dwelling units shall be computed in accordance with either (a) or (b).

(2) Other than Dwelling Units. Loads for new circuits or extended circuits in other than dwelling units shall be computed in accordance with either (a) or (b).

Application

This revised section has integrated material that formerly appeared as exceptions into positive statement code text. The note for general lighting circuit calculation that used to appear at the bottom of Table 220-3(b) has been included in this section as Section 220-3(b)(10).

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:42 2005

Background and Explanation

In the 1996 NEC this section consisted of a series of rules and five exceptions. The extensive revision eliminated the exceptions by moving them into the main text. The new arrangement provides a more usable code section.

220-3(b)(9) Calculation of Multiple Receptacle Devices

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Receptacle outlets with more than three receptacles on a strap are computed at 90VA per receptacle.

Code Language

220-3. Computation of Branch Circuit Loads.

•
•
•

(9) Receptacle Outlets. Except as covered in (10), receptacle outlets shall be computed at not less than 180 volt-amperes for each single or for each multiple receptacle on one strap. A **single piece of equipment consisting of a multiple receptacle comprised of four or more receptacles shall be computed at not less than 90 volt-amperes per receptacle.**

This provision shall not be applicable to the receptacle outlets specified in Sections **210-11(c)(1) and (2).** (ROC 2-4)

Application

Convenience receptacle outlets in commercial and industrial occupancies are computed per outlet. This has been computed at 180VA per strap for receptacle outlets not intended for a specific appliance or other load. Multiple receptacles with more than three receptacles are increasingly common. The NEC now requires that a "fourplex" receptacle on a single strap be computed at 4 × 90VA = 360VA. Similarly, a "sixplex" receptacle on a single strap is computed at 6 × 90VA = 540VA. The illustration shows five common configurations of 125-volt 15-ampere receptacles.

These computations do not apply to residential load calculations. Most receptacles in dwelling units, other than those intended for specific appliances, which are covered by 220-3(b)(1), are included in the general lighting load, the small appliance load, or the laundry load. (See Section 220-3(b)(10).)

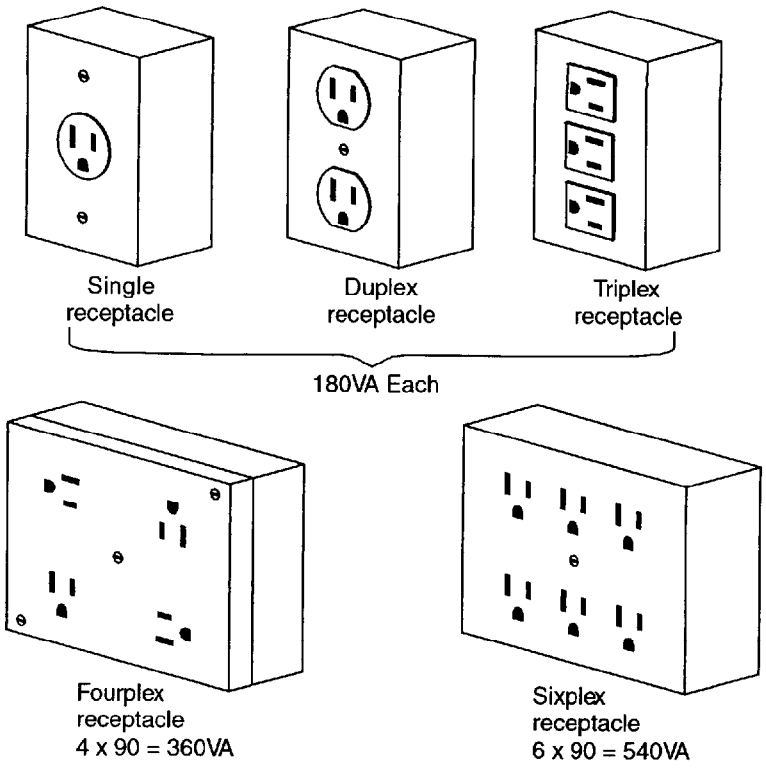
Wed Feb 02 02:30:42 2005



Calculation of Receptable Loads

Background and Explanation

Prior to the 1990 edition of the code, receptacle outlets were computed at 180 VA per outlet regardless of the number of receptacles at the outlet. A four-gang outlet box with four duplex receptacles counted the same as a single outlet in a single-gang box. (An "outlet" is defined in Article 100 as a location, not as a device or a piece of equipment.)

Since 1990 the computation of receptacle loads has been based on the number of straps, therefore two duplex receptacles in a box are computed at 2 × 180VA = 360VA. As multiple receptacles with up to six receptacles on a strap became more common, inspectors had no basis in the code for requiring a load calculation of more than 180VA per strap. This change addresses the newer style receptacle arrangements.

The reasoning behind this change is the same as the reasoning behind the 1990 change: If more receptacles are desired, more things are likely to be plugged in. If six cord- and plug-connected loads are connected to a single outlet, it makes sense to assume there is more load than if only two loads were connected to the same outlet.

220-12 Track Lighting Feeder Calculation

Type of Change Relocated

BRIEF SUMMARY

All occupancies. Calculation of track lighting loads is relocated to the proper article.

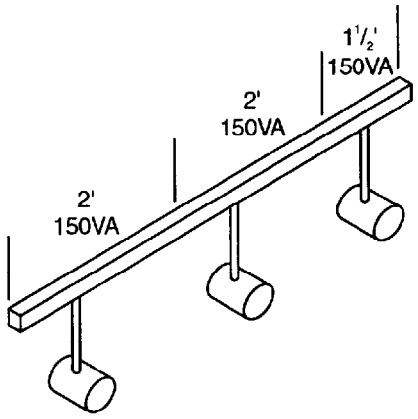
Code Language

220-12. Show-Window **and Track Lighting.**

(a) **Show Windows.** For show-window lighting, a load of not less than 200 volt-amperes shall be included for each linear foot (305 mm) of show window, measured horizontally along its base.

FPN: See Section **220-3(b)(7)** for branch circuits supplying show windows.

(b) Track Lighting. For track lighting in other than dwelling units or guest rooms of hotels or motels, an additional load of 150 volt-amperes shall be included for every 2 ft (610 mm) of lighting track or fraction thereof. (ROC 2-158a)



Calculation of Track Lighting Loads

Application

Track lighting in other than residential occupancies and guest rooms of hotels and motels is considered to be special-use lighting. This load is in addition to the normal lighting load calculated from Section 220-3(a). Track lighting loads are calculated at 150 volt-amperes per every 2 feet or fraction thereof.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:43 2005

Background and Explanation

To aid the code user, this load calculation was relocated from Article 410 to Article 220. This change places the calculation with most other feeder calculations to enhance the usability of the code. This section provides the method to calculate track lighting loads on feeders and services and does not limit the linear footage of track permitted on a branch circuit. The branch-circuit sizing for track lighting is limited by the rating and listing of the track.

220-15 Exc. Deleted Electric Heating Exception

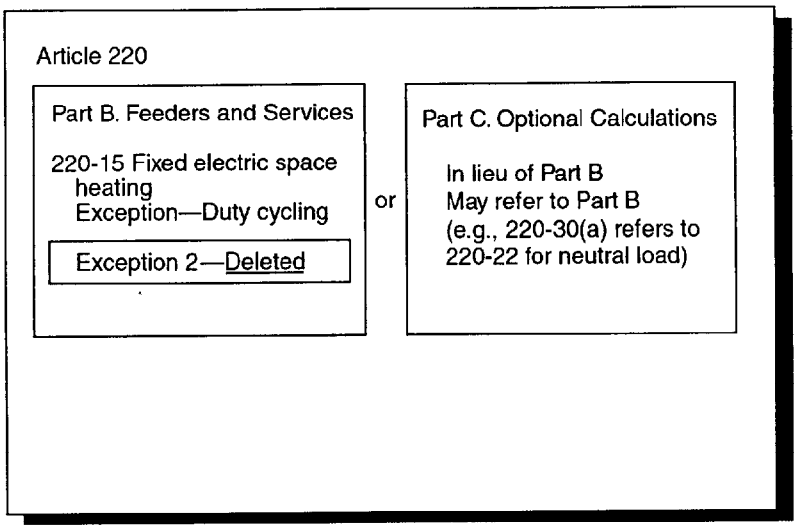
Type of Change Deletion

BRIEF SUMMARY

All installations. An exception referring to optional calculations for fixed electric space heating has been deleted.

Code Language

See flow chart.



Exception Deleted

Background and Explanation

Section 220-15 is located in Part B of Article 220. Part B is referred to as the standard method of computing feeder and service loads. The deleted exception seemed to imply that the optional calculation methods of Part C could be used as part of the standard method. For example, in Section 220-15 of Part B, fixed electric space heating is to be figured at 100 percent of the connected load. However, based on Section 220-15 Exception No. 2 in the 1996 NEC, a code user might infer that four or more baseboard heaters with separate thermostats could be computed at 40 percent of the nameplate load as allowed in the optional calculation in Section 220-30. Yet Section 220-30 said it was to be used "in lieu of the

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:43 2005

method specified in Part B . . . ." (The 1999 NEC says "instead of the method specified in Part B . . . .")

The deleted exception can be traced back to the 1971 NEC. Prior to the 1975 NEC, Article 220 had no lettered parts. All calculation methods were in one part. Exceptions were necessary to recognize the optional calculation methods. Section 220-7 in the 1971 NEC became Section 220-30 of Part C in the 1975 NEC. With the addition of Part C, which modifies Part B, the exceptions in Part B, which recognized the optional calculations, were rendered unnecessary. It was not intended to permit the mixing of components from the calculation methods of Parts B and C.

220-16(a) Exc. Dwelling Unit Refrigerator Load

Type of Change

Revision and New

BRIEF SUMMARY

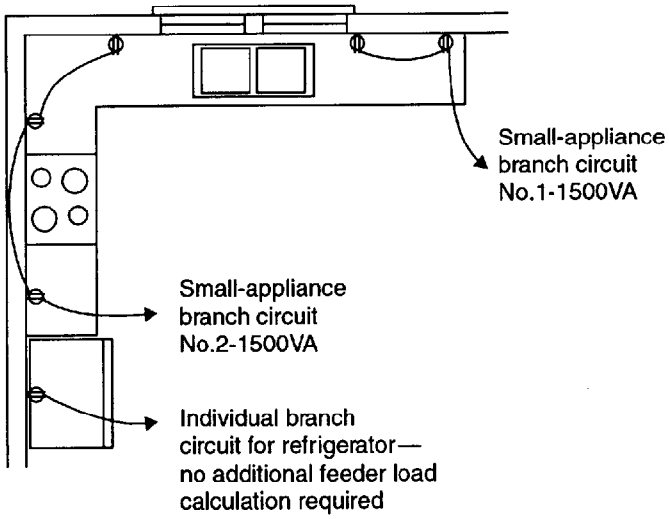
Residential. Calculations for small-appliance circuits in dwelling units are clarified.

Code Language

220-16. Small Appliance and Laundry Loads—Dwelling Unit.

(a) Small Appliance Circuit Load. In each dwelling unit, the ~~feeder~~ load shall be computed at 1500 volt-amperes for each 2-wire small-appliance branch circuit required by Section **210-11(c)(1)**. Where the load is subdivided through two or more feeders, the computed load for each shall include not less than 1500 volt-amperes for each 2-wire small-appliance branch circuit. These loads shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 220-11. (ROP 2-5) (ROC 2-186)

Exception: The individual branch circuit permitted by Section 210-52(b)(1), Exception No. 2 shall be permitted to be excluded from the calculation required by Section 220-16. (ROP 2-312)



Individual Branch Circuit for Refrigerator

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:44 2005

Application

Section 210-52(b)(1) requires a minimum of two 20-ampere small-appliance branch circuits. These circuits are permitted to supply the refrigeration equipment. Section 220-16(a) requires a feeder calculation of 1500VA for each of these small-appliance circuits. Where the refrigeration equipment is connected to one of the required circuits, the refrigeration load is included in the 1500VA calculation.

Section 210-52(b)(1) Exception allows the refrigeration equipment to be supplied by a separate circuit rated 15 amperes or greater. The new exception in Section 220-16(a) clarifies that no additional load calculation is required for the separate circuit dedicated to the refrigeration equipment. In this case the load from the refrigeration is included in the 3000VA calculated for the required small-appliance circuits.

Background and Explanation

The main rule in Section 220-16(a) is revised to eliminate redundant requirements and update the references that have been renumbered. The new exception has been added to clarify that a separate refrigeration circuit in a dwelling unit does not require an additional load calculation. When Exception 2 to Section 210-52(b)(1) first appeared in the 1996 NEC, it was not clear whether an additional load calculation for the individual branch circuit was required.

220-18 Dryer Calculations on 3-Phase Circuits

Type of Change Revision

BRIEF SUMMARY

Residential and multifamily. The application of demand factors to multiple household electric dryers connected to a 3-phase system is clarified.

Code Language

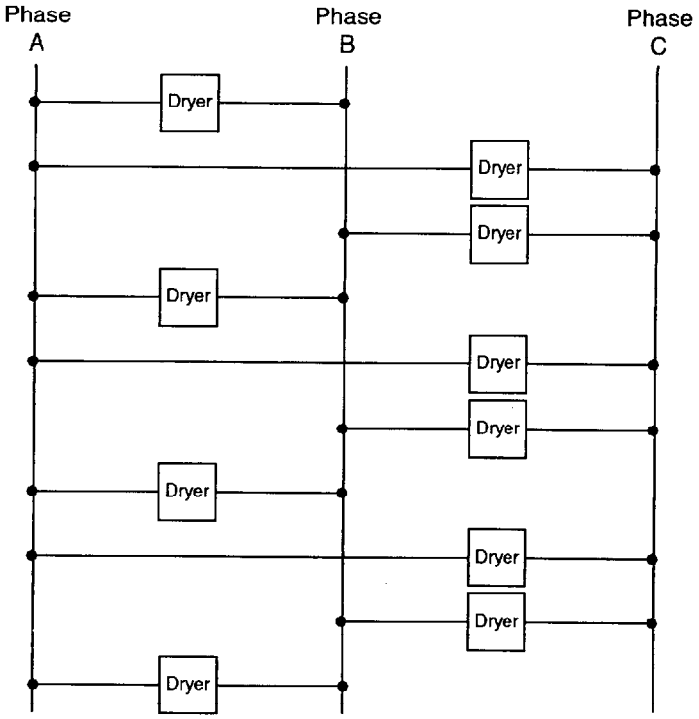
220-18. Electric Clothes Dryers in Dwelling Unit(s). The load for household electric clothes dryers in a dwelling unit(s) shall be 5000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 220-18 shall be permitted. **Where two or more single-phase dryers are supplied by a 3-phase, 4-wire feeder or service, the total load shall be computed on the basis of twice the maximum number connected between any two phases.** (ROP 2-344) (ROC 2-186)

Application

The illustration shows ten electric dryers connected to a 3-phase system. (Neutral connections are not shown.) Each dryer is 5000VA and the system is 208/120V. The demand load for the feeder or service conductors supplying these loads can be found as follows:

1. Identify the maximum number of dryers connected between any two phases. The illustrations shows four dryers connected A to B, three connected A to C, and three connected B to C. The maximum number connected between any two phases is four.
2. Select a demand factor based on twice the maximum number connected between any two phases. Four times two is eight. The demand factor from Table 220-18 for eight dryers is 60 percent.
3. Determine the total connected load. Ten dryers at 5000VA each is 50,000VA total connected load.
4. Apply the demand factor from Step 2 to the total connected load from Step 3 to determine the calculated or demand load. 50,000 × 60 percent = 30,000VA. The calculated load is 30,000VA.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:45 2005



4 dryers connected between
Phase A and Phase B
4 x 2 = 8 dryers
8 dryers = 60% demand
10 dryers total x 5000VA = 50,000VA
50,000VA x 60% = 30,000VA demand load

Dryer Loads on Three-Phase System

Background and Explanation

This change is meant to clarify how 3-phase feeders or service conductors are to be sized when supplying multiple household electric dryers. Three-phase systems are often used to supply single-phase power to large multifamily dwellings. This makes 3-phase power available for house loads such as elevators and pool heaters, while still providing for single-phase systems to individual dwelling units.

Prior to the 1999 NEC, the code did not say how to deal with this issue. Using the total number of dryers to find a demand factor could result in undersized conductors on 3-phase systems because the load of the single-phase dryers will be distributed across the ungrounded conductors of a 3-phase system. Using only the number connected between any two phases to find a demand factor would, in the example given here, result in full-sized conductors (demand factor for four dryers = 100 percent), even though some diversity is highly likely with ten dryers. The change permitting the demand factor to be selected on the basis of twice the number connected between any two phases follows similar language used for household electric cooking equipment in 220-19.

220-21 Loads Not in Use Simultaneously

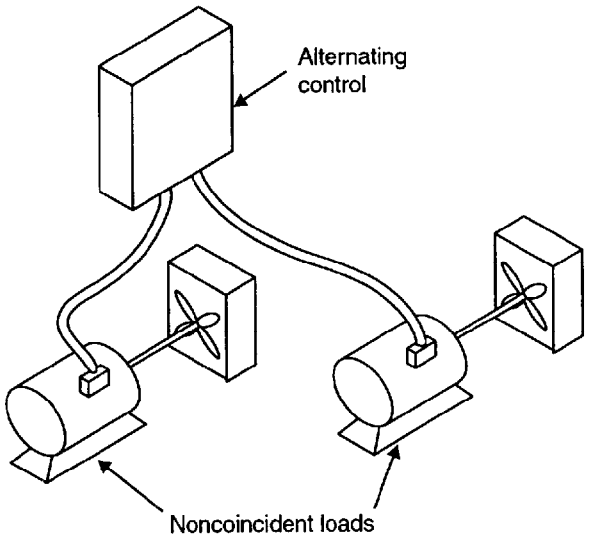
Type of Change Revision

BRIEF SUMMARY

All occupancies. Section is revised to clarify that noncoincident loads are not required to be dissimilar.

Code Language

220-21. Noncoincident Loads. Where it is unlikely that two **or more noncoincident** loads will be in use simultaneously, it shall be permissible to **use only the largest load(s) that will be used at one time,** in computing the total load of a feeder **or service.** (ROP 2-318) (ROC 2-161, 2-186)



Similar Loads Not in Simultaneous Use

Application

Where two similar loads, such as two heaters, are not operated at the same time, one of the loads may be omitted from the feeder of service calculation. When the loads are not the same size, the smaller load is to be omitted.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:46 2005

It is important to note that Section 220-14 requires that motor calculations be in accordance with Sections 430-24, 430-25, and 430-26. Section 430-26 requires special permission from the authority having jurisdiction for the application of demand factors of this type.

Background and Explanation

The substantiation found in Proposal 2-318 suggested that there was no need to require loads to be dissimilar in order to allow a calculation reduction for nonsimultaneous operation. Motors were cited as an example in this proposal. Sections 220-14 and 430-26 were not changed, therefore special permission is still required for the application of demand factors where motors are involved.

Wed Feb 02 02:30:47 2005

220-35 Adding to Existing Installations

Type of Change Revision

BRIEF SUMMARY

All installations. Section and exception were rewritten to clarify use of demand records to determine existing load.

Code Language

220-35. Optional Calculations for ~~Additional Loads to Existing Installations~~ **Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine the existing load under the following conditions.** (ROP 2-321) (ROC 2-167, 2-169)

1. The maximum demand data is available for a 1-year period.

Exception: If the maximum demand data for a 1-year period is not available, ***the calculated load shall be permitted to be based on the maximum demand (measure of average power demand over a 15-minute period)*** *continuously recorded over a minimum 30-day period using a recording ammeter* ***or power meter*** *connected to the highest loaded phase of the feeder or service,* ***based on the initial loading at the start of the recording.*** *The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space is occupied and shall include by measurement or calculation the larger of the heating or cooling equipment load,* ***and other loads that may be periodic in nature due to seasonal or similar conditions.***

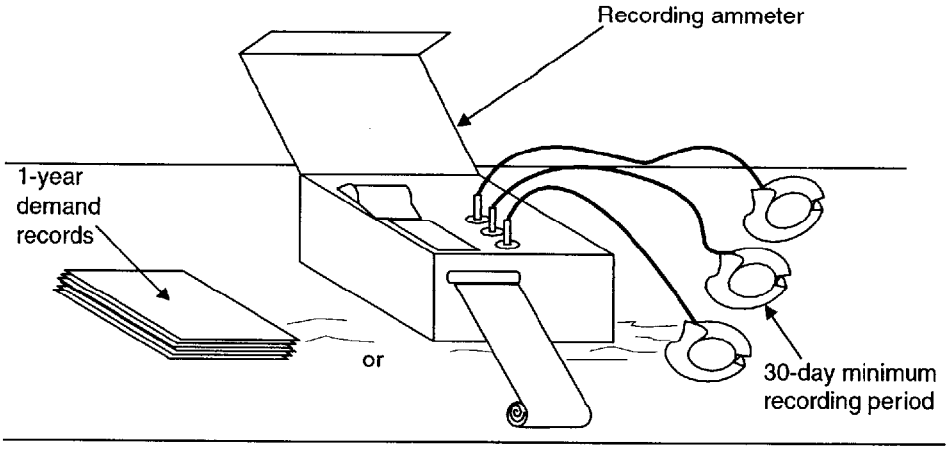
2. The **maximum** demand at 125 percent plus the new load does not exceed the ampacity of the feeder or rating of the service.

3. The feeder has overcurrent protection in accordance with Section 240-3, and the service has overload protection in accordance with Section 230-90.

Application

The illustration shows two basic methods of obtaining demand information. Demand information is usually available from utility records or power bills for commercial and industrial occupancies. Demand meters are less likely to be used by utilities for residential metering. Recording ammeters or recording power meters may also be used to obtain demand information.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:47 2005



Measuring Existing Load for Additional Load

Section 220-35 is divided into three steps:

1. Obtain the maximum demand for a 1-year period. If the maximum demand is not available for a 1-year period, the demand information can be obtained by recording the usage over a 30-day period. The phase with the highest load at the time of the initial measurement must be recorded. The measurements shall be taken while the building is in use and must include the larger of heating or cooling loads and any other periodic or seasonal loads. Designers may include loads that are periodic or seasonal by actually measuring them or by calculating any loads not measured and adding them to the measured load.
2. Determine the required capacity of feeders or service conductors by adding the new load to 125 percent of the maximum demand load determined in Step 1. This value may then be compared to the existing feeder or service capacity to determine whether the existing installation is adequate for the new load. This value may also be used to size new services or feeders to handle the existing load plus the new load.
3. Verify that feeder and service overcurrent protection comply with 240-3 for the feeder and 230-90 for the service.

Background and Explanation

This change is meant to clarify four issues:

1. The title of this section was changed to "Optional Calculations for Determining Existing Loads" to clarify that the optional method of 220-35 is meant to measure "existing load," which may be supplied either by existing or new service or feeder conductors or distribution equipment.
2. The change clarifies that the highest loaded phase at the start of recording is considered to be the highest loaded phase for the purposes of recording maximum demand. This makes it clear that all phases do not have to be recorded for 30 days, and that a meter that records a single phase may be used.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:48 2005

3. The change clarifies the meaning of "maximum demand" by explaining that it is the highest average demand over a 15-minute period. This is the method used by utilities to measure demand.
4. The change also explains that any periodic or seasonal loads must be included in the maximum demand, not just the larger of heating or air conditioning. The periodic loads and the maximum demand may be determined by measurement or calculation.

The proposal also included a provision to reduce the measurement period from 30 days to 7 days. This part of the proposal was rejected because of insufficient technical substantiation within the proposal to warrant a reduction in the monitoring period.

225-19(d)
230-9 Horizontal Clearances for Conductors from Platforms

Type of Change Revision

BRIEF SUMMARY

All installations. Vertical clearances from overhead service drops and outside feeders and branch circuits must be maintained over and near building projections and platforms.

Code Language

225-19. Clearances from Buildings for Conductors of Not Over 600 Volts, Nominal.

•
•
•

(d) Final Spans. Final spans of feeders or branch circuits to a building they supply or from which they are fed shall be permitted to be attached to the building, but they shall be kept not less than 3 ft (914 mm) from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations. **Vertical clearance of final spans above, or within 3 ft (914 mm) measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with Section 225-18.** (ROP 4-42a) (ROC 4-31)

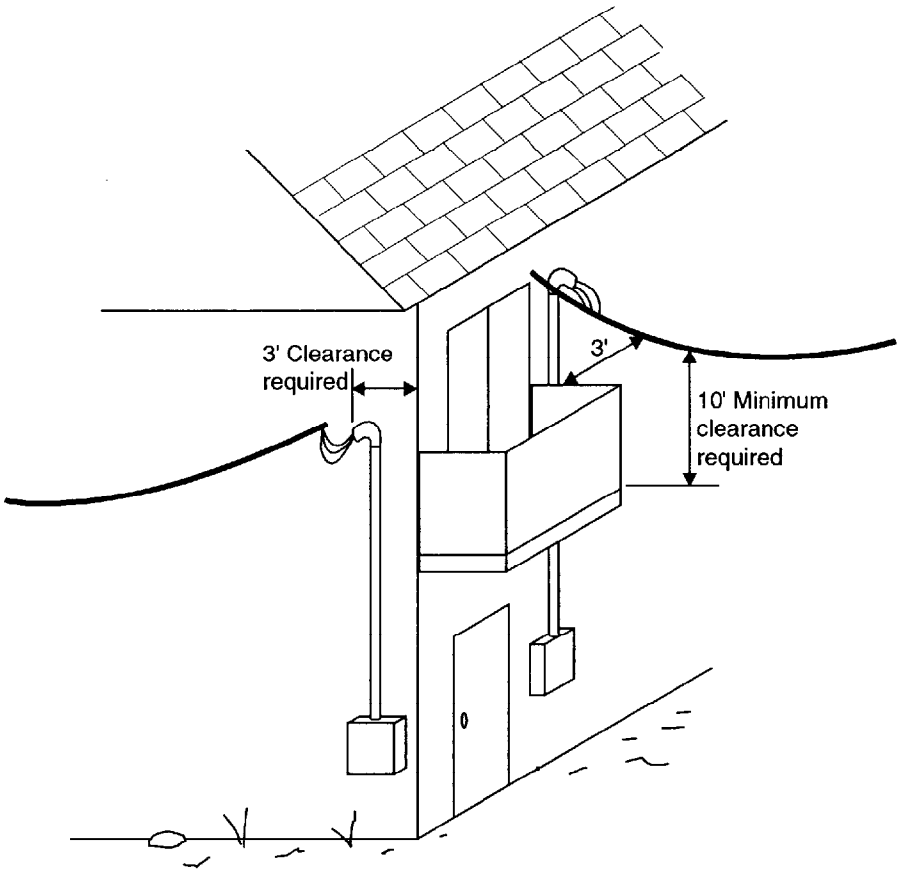
Exception: Conductors run above the top level of a window shall be permitted to be less than the 3 ft (914 mm) requirement above.

Application

Overhead clearances are specified in Section 225-18 for outside branch circuits and feeders and in Section 230-24(b) for services. These clearances must be maintained where the conductors pass over platforms or projections from which the conductors could be reached.

In the illustration, two sets of conductors pass near a balcony. The conductors could be service conductors, feeders, or branch circuits. In this example the voltage to ground is 150 volts or less. The balcony is obviously only accessible to pedestrians, not vehicles. From Sections 225-18 or 230-24(b), the clearance that must be maintained is ten feet where the conductors pass above the balcony or pass above the area within 3 feet of the balcony. The 3-foot clearance required by Sections 225-19(d) or 230-9 must also be maintained.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:49 2005



Clearances from Platforms or Projections

Background and Explanation

The substantiation for this proposal stated that the change was made "To clarify that the 10 ft must be maintained above platforms and surfaces." Section 225-18 already contained wording to that effect, but only under the 10-foot rule. Section 230-24(b) did not mention platforms or projections.

Under the new wording, the clearance that would apply to ground now also applies to platforms or surfaces, and the clearance is not limited to 10 feet. The applicable clearance must be maintained for 3 feet horizontally around the balcony. The required clearance depends on the voltage and the exposure. In some cases the required clearance might be 12 feet or 15 feet or even 18 feet if a projection was somehow subject to truck traffic. Sections 225-19(a) Exception No. 1 and 230-24(a) Exception No. 1 provide similar requirements for clearances above roofs.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:49 2005

NEC pp. 59–60

Article 225
Part B Rules for Multiple Buildings

Types of Change
New and Relocation

BRIEF SUMMARY

All occupancies. Requirements where more than one building is supplied by a single service are clarified.

Code Language

B. More Than One Building or Other Structure.

225-30. Number of Supplies. Where more than one building or other struture is on the same property and under single management, each building or other structure served shall be supplied by one feeder or branch circuit unless permitted in (a) through (e). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit.

(a) Special Conditions. Additional feeders or branch circuits shall be permitted to supply the following:

(1) Fire pumps

(2) Emergency systems

(3) Legally required standby systems

(4) Optional standby systems

(5) Parallel power production systems

(b) Special Occupancies. By special permission, additional feeders or branch circuits shall be permitted for

(1) Multiple-occupancy buildings where there is no available space for supply equipment accessible to all occupants, or

(2) A single building or other structure sufficiently large to make two or more supplies necessary.

(c) Capacity Requirements. Additional feeders or branch circuits shall be permitted where the capacity requirements are in excess of 2000 amperes at a supply voltage of 600 volts or less.

(d) Different Characteristics. Additional feeders or branch circuits shall be permitted for different voltages, frequencies, or phases, or for different uses, such as control of outside lighting from multiple locations.

(e) Documented Switching Procedures. Additional feeders or branch circuits shall be permitted to supply installations under single management where documented safe switching procedures are established and maintained for disconnection.

•
•
•

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:50 2005

225-35. Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's supply disconnecting means.

Exception: In a multiple-occupancy building where electric supply and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the supply disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

225-36. Suitable for Service Equipment. The disconnecting means specified in **Section 225-31** shall be suitable for use as service equipment.

Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches shall be permitted as the disconnecting means.

225-37. Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch-circuit disconnect location denoting all other services, feeders, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each. See Section 230-2(b).

Exception No. 1: A plaque or directory shall not be required for large capacity multibuilding industrial installations under single management, where it is ensured that disconnection can be accomplished by establishing and maintaining safe switching procedures.

Exception No. 2: This identification shall not be required for branch circuits installed from a dwelling unit to a second building or structure.

225-38. Disconnect Construction.

(a) Manually or Power Operable. The disconnecting means shall consist of either (1) a manually operable switch or a circuit breaker equipped with a handle or other suitable operating means or (2) a power-operable switch or circuit breaker, provided the switch or circuit breaker can be opened by hand in the event of a power failure.

(b) Simultaneous Opening of Poles. Each building or structure disconnecting means shall simultaneously disconnect all ungrounded supply conductors that it controls from the building or structure wiring system.

(c) Disconnection of Grounded Conductor. Where the building or structure disconnecting means does not disconnect the grounded conductor from the grounded conductors in the building or structure wiring, other means shall be provided for this purpose at the location of disconnecting means. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose.

In a multisection switchboard, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard, provided any such switchboard section is marked.

(d) Indicating. The building or structure disconnecting means shall plainly indicate whether it is in the open or closed position.

225-39. Rating of Disconnect. The feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be carried, determined in accordance with Article 220. In no case shall the rating be lower than specified in (a), (b), (c), or (d).

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:50 2005

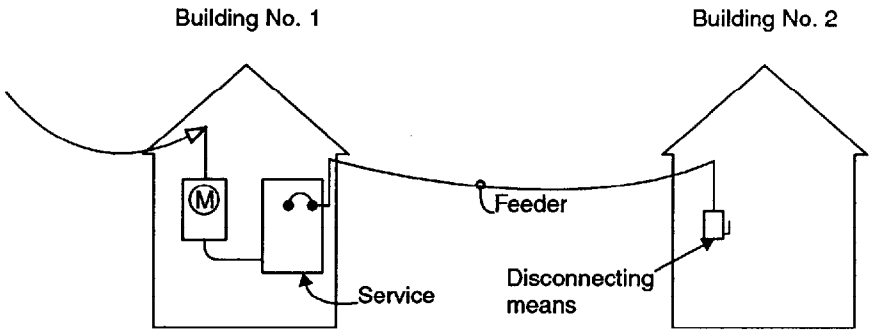
(a) One-Circuit Installation. For installations to supply only limited loads of a single branch circuit, the branch-circuit disconnecting means shall have a rating of not less than 15 amperes.

(b) Two-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the feeder or branch-circuit disconnecting means shall have a rating of not less than 30 amperes.

(c) One-Family Dwelling. For a one-family dwelling, the feeder disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(d) All Others. For all other installations, the feeder or branch-circuit disconnecting means shall have a rating of not less than 60 amperes.

225-40. Access to Overcurrent Protective Devices. Where a feeder overcurrent device is not readily accessible, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of a lower ampere rating than the feeder overcurrent device.



Disconnecting Means Required at Each Building

Application

Section 225-30 limits the number of electrical supplies to each building to one feeder or branch circuit. Provisions are included to allow multiple supplies similar to the Article 230 rules that allow multiple services.

Sections 225-31 through 225-34 have been relocated from Section 225-8 and no major changes were made.

Section 225-35 requires that the occupants have access to the building disconnect. This corresponds to the service requirement in Section 230-72(c). Sections 225-36 and 225-37 are relocated from Section 225-8.

Section 225-38 covers the rating of the disconnect and is similar to Section 230-79.

This extensive revision eliminated a number of cross references and clarifies the requirements for multiple buildings.

Background and Explanation

This revision is intended to limit the number of supply circuits to a building with exceptions similar to Section 230-2 for multiple services. A number of requirements from other articles are repeated in Part B to eliminate cross referencing. This group of rules plus the special rules for over 600 volts in new Part C, covers all outside branch-circuit and feeder installations.

Type of Change New

BRIEF SUMMARY

Industrial. Requirements for outside feeders and branch circuits over 600 volts are provided.

Code Language

C. Over 600 Volts

225-50. Warning Signs. Signs with the following words "Warning—High Voltage—Keep Out" shall be posted in plain view where unauthorized persons might come in contact with live parts.

225-51. Isolating Switches. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute a building disconnecting means, an isolating switch with visible break contacts and meeting the requirements of Section 230-204(b), (c), and (d) shall be installed on the supply side of the disconnecting means and all associated equipment.

Exception: The isolating switch shall not be required where the disconnecting means is mounted on removable truck panels or metal-enclosed switchgear units that cannot be opened unless the circuit is disconnected and that, when removed from the normal operating position, automatically disconnect the circuit breaker or switch from all energized parts.

225-52. Location. A building or structure disconnecting means shall be located in accordance with Section 225-32, or it shall be electrically operated by a similarly located remote-control device.

225-53. Type. Each building or structure disconnect shall simultaneously disconnect all ungrounded supply conductors it controls and shall have a fault-closing rating not less than the maximum available short-circuit current available at its supply terminals.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault closing rating of the disconnecting means. (ROC 4-36)

Wed Feb 02 02:30:52 2005

Application

Premises wiring systems that employ over 600 volt distribution systems for multi-building complexes are commonplace in industrial and institutional settings. Within these installations it is also common to find branch circuits that supply equipment over 600 volts. These supply systems are not utility services, rather they are part of the premises wiring system and are frequently installed outdoors. This new set of rules provides requirements for outside branch circuits and feeders rated over 600 volts.

Background and Explanation

To clarify the requirements for installations over 600 volts, information has been located in this new part. Rules for these applications were located in other articles resulting in some confusion. This restructuring brings requirements together in a more usable format.

NEC pp. 64 & 66

230-40 Excs. & 230-71(a) Number of Sets of Service-Entrance Conductors

Type of Change Revision

BRIEF SUMMARY

All occupancies. Restrictions on the number of sets of service-entrance conductors are clarified.

Code Language

230-40. Number of Service-Entrance Conductor Sets. Each service drop or lateral shall supply only one set of service-entrance conductors.

Exception No. 1: Buildings with one or more than one occupancy shall be permitted to have one set of service-entrance conductors ***for each class of service*** *run to each occupancy or group of occupancies.* (ROP 4-93)

•
•
•

Exception No. 4: A two-family dwelling or a multifamily dwelling shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in Section 210-25. (ROP 4-93)

Exception No. 5: One set of service-entrance conductors connected to the supply side of the normal service disconnecting means shall be permitted to supply each or several systems covered by Section 230-82(3). (ROP 4-93)

230-71. Maximum Number of Disconnects.

(a) General. The service disconnecting means for each service permitted by Section 230-2, or for each set of service-entrance conductors permitted by Section 230-40, Exception Nos. 1 **or 3,** shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment or the control circuit of the ground-fault protection system, installed as part of the listed equipment, shall not be considered a service disconnecting means. (ROP 4-144, 4-148, 4-149)(ROC 4-94)

One Service Drop with Multiple Sets of Service Conductors

Application

Section 230-40 Exception No. 1: Where a building of one or more than one occupancy is supplied by several classes of service, each occupancy may have one set of service conductors for each class of service. A service drop or lateral for each class of service run to a building (for instance 120/240 volt, single phase and 480 Y/277 volt, 3 phase) is permitted to supply multiple sets of service-entrance conductors that are run to each occupancy.

Section 230-4 Exception No. 4: In two-family or multifamily dwellings, Section 210-25 requires a separate supply system for the common area equipment such as hallway lighting. This new exception allows a separate set of service conductors for this supply system.

Section 230-40 Exception No. 5: Section 230-82(5) allows a connection ahead of the service main for solar photovoltaic systems or interconnected electric-power production sources. This new exception allows a set of service-entrance conductors for the connections to these systems.

Section 230-71(a): Section 230-40 Exception No. 3 allows a set of service entrance conductors to be run to a separate building at a single-family dwelling. The disconnecting means at this separate structure may consist of up to six switches or circuit breakers.

Background and Explanation

The revisions were made to clarify the application of the rules and to provide for systems not covered here in the 1996 NEC. The revised Exception No. 1 recognizes a similar installation that is permitted for a single occupancy building in Section 230-2(d).

230-42 Sizing of Service-Entrance Conductors

Type of Change Revision

BRIEF SUMMARY

All occupancies: Clarifies the sizing of the grounded service entrance conductor.

Code Language

230-42. Minimum Size and Rating.

(a) General. The ampacity of the service-entrance conductors before the application of any adjustment or correction factors shall not be less than either (1) or (2). Loads shall be determined in accordance with Article 220. Ampacity shall be determined from Section 310-15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.

1. The sum of the noncontinuous loads plus 125 percent of continuous loads

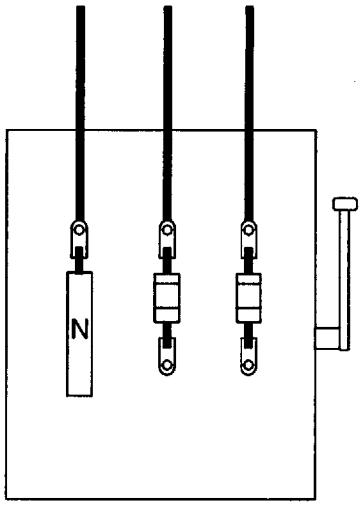
2. The sum of noncontinuous load plus the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating. (ROC 4-65)(TCC 4-65)

(b) Ungrounded Conductors. Ungrounded conductors shall have an ampacity of not less than **the minimum rating of the disconnecting means specified in Section 230-79.** (ROP 4-95b) (ROC 4-69)

Application

Section 230-42(b) requires the use of Section 230-79 for the selection of the ungrounded service-entrance conductors. Section 230-79 allows the rating of the service disconnect to be based on the load calculated from Article 220. The illustration gives an example of the sizing of various sevice components based on a noncontinuous load of 12,200VA and a continuous load of 16,200VA.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:54 2005



Total noncontinuous loads .....12,200 volt-amperes
Total continuous load @ 125%
16,200 x 1.25 .....20,250 volt-amperes
Total load .....32,450 volt-amperes

32,450 volt-amperes ÷ 240 volts = 135 amperes

The next higher standard size is 150 amperes (Section 240-6).

Minimum size disconnect: 135A 230-79
Minimum size ungrounded conductor: 135A 230-42(b), 230-79
Standard switch rating: 200A
Minimum standard fuse or circuit breaker: 150A 240-6

Determining Service Conductor Ampacity

Background and Explanation

The requirements for sizing the ungrounded service-entrance conductors and the service disconnecting means have contained similar language in past editions of the code. Section 230-79 was modified for the 1999 NEC and the panel decided that simply referencing Section 230-79 instead of repeating similar wording in Section 230-42 provided better correlation between the two sections. The requirements for service conductor sizing formerly located in Section 220-10(b) have been relocated to Section 230-42(a) as part of the effort to take conductor and overcurrent device-sizing requirements out of Article 220.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:55 2005

230-46 Splicing of Service-Entrance Conductors

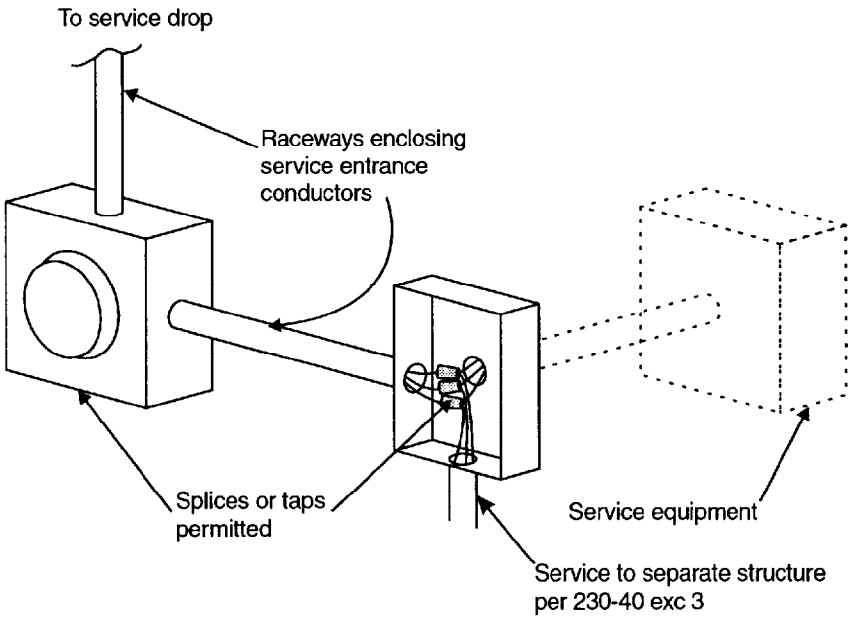
Type of Change Revision

BRIEF SUMMARY

All installations. Splices in service-entrance conductors are permitted.

Code Language

230-46. Spliced Conductors. **Service-entrance conductors shall be permitted to be spliced or tapped by clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices of conductors shall be made in accordance with Sections 110-14, 300-5(e), 300-13, and 300-15.**



Splices in Service-Entrance Conductors

Application

The illustration shows service-entrance conductors run from an overhead service drop, through a meter base, through a junction box, and to the service equipment immediately inside the building. The splices in the junction box

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:55 2005

may have been made to facilitate a service change or move. The splices in the meter base would be necessary even for a new installation.

Service-entrance conductors may now be spliced or tapped as long as the splices or taps are enclosed and made by clamped or bolted connections. Underground splices need not have enclosures but must be made with devices listed for the purpose. The provisions of Sections 110-14, 300-5(e), 300-13, and 300-15 apply to the splices.

Background and Explanation

This section in the 1996 NEC was titled "Unspliced Conductors." The previous rule was that service-entrance conductors could not be spliced, with six exceptions. The splices shown in the junction box in the illustration would not have been permitted under the 1996 NEC as they would not fit any of the six exceptions. However, the splices in the meter base would have been permitted by Exception No. 1 in the 1996 code. The new rule recognizes the need for and common practice of splicing service-entrance conductors for repairs, to relocate equipment, or for any of the reasons covered by the previous exceptions.

One concern with splices in service-entrance conductors is that the conductors generally have no short-circuit or ground-fault protection. The former prohibition against splices was intended to increase the reliability of the conductors. Improperly made splices are of particular concern. Nevertheless, because the many exceptions that allowed splicing had not resulted in problems, the rule was changed to permit splices. Wording was added to specify the types of splicing devices permitted and the six exceptions were eliminated.

230-50(a) Protection of Service Cables

Type of Change Deletion

BRIEF SUMMARY

All installations. The list of conditions that would expose service-entrance cables to physical damage have been deleted.

Code Language

230-50. Protection of Open Conductors and Cables Against Damage—Above Ground. Service-entrance conductors installed above ground shall be protected against physical damage as specified in (a) or (b).

(a) Service Cables. Service cables, where subject to physical damage, shall be protected by any of the following:

1. Rigid metal conduit
2. Intermediate metal conduit
3. Rigid nonmetallic conduit suitable for the location
4. Electrical metallic tubing
5. Other approved means (ROP 4-112a, 4-112b)

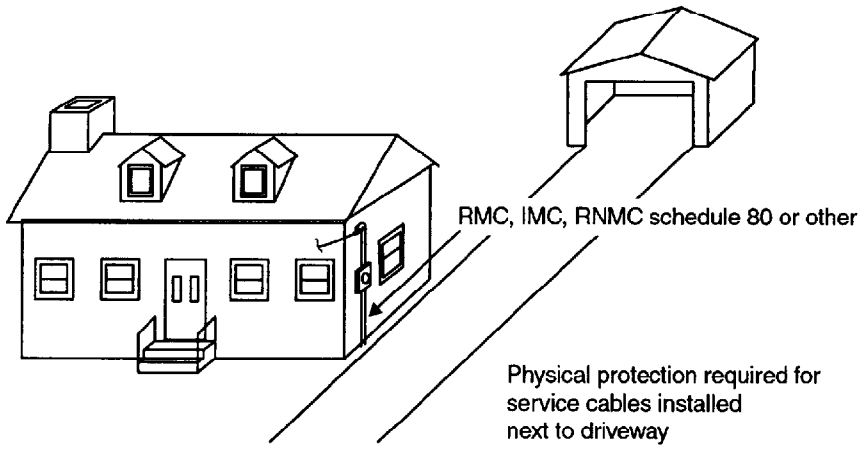
(b) Other Than Service Cable. Individual open conductors and cables other than service cables shall not be installed within 10 ft (3.05 m) of grade level or where exposed to physical damage. (ROP 4-112b)

Exception: Type MI and Type MC cable shall be permitted within 10 ft (3.05 m) of grade level where not exposed to physical damage or where protected in accordance with Section 300-5(d).

Application

Where service-entrance cables are subject to physical damage, they must be protected. Five methods of protection are listed: rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or by other approved means. What constitutes "subject to physical damage" is left to interpretation by the authority having jurisdiction.

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:56 2005



An Area Where Service Cables Require Physical Protection

Background and Explanation

This change eliminates the specific list of conditions under which service cables must be protected and substitutes the undefined phrase "where subject to physical damage." The substantiation stated that the reason for this change is to reserve judgment to the authority having jurisdiction to determine the locations where service conductors are subject to physical damage. The authority having jurisdiction may be the electrical inspector, utility company, or both.

230-79 Minimum Rating of Service Disconnect for One-Family Dwelling Unit

Type of Change Revision

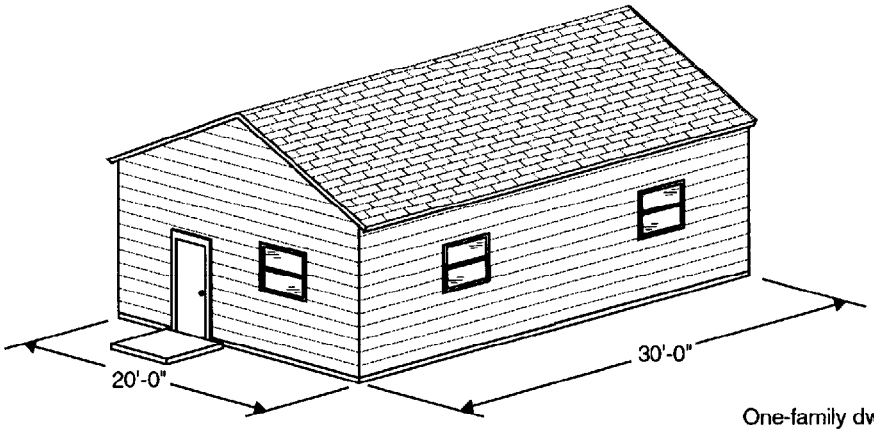
BRIEF SUMMARY

Residential. The minimum size service disconnect for a one-family dwelling unit is 100 amperes regardless of initial load or number of branch circuits.

Code Language

230-79. Rating of Service Disconnecting Means. The service disconnecting means shall have a rating not less than the load carried, determined in accordance with Article 220. In no case shall the rating be lower than specified in (a), (b), (c), or (d). (ROP 4-152b)

(c) One-Family Dwelling. For a one-family dwelling, the service disconnecting means shall have a rating of not less than 100 amperes, 3-wire. ~~under either of the following conditions: (1) where the initial computed load is 10k VA or more, or (2) where the initial installation consists of six or more 2-wire branch circuits.~~ (ROP 4-152b)



Minimum Residential Service Size

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:57 2005

Application

The illustration shows a small single-family dwelling unit. This dwelling has gas heat, a gas range, is plumbed for a gas dryer, and has no air conditioning. The gas furnace has a nameplate that lists the load at 120 volts, 12 amperes and requires a minimum 15-ampere branch circuit. Based on Article 220, the load would be computed as follows:

Floor area = 30 ft × 20 ft = 600 sq. ft	
1 General lighting circuit—(600 sq. ft × 3VA/sq. ft)	= 1800VA
2 Small-appliance branch circuits—(2 × 1500VA)	= 3000VA
1 Laundry circuit—(1 × 1500VA)	= 1500VA
Load subject to Table 220-11 demand factors	= 6300VA
Feeder load after demand factors (3000 @ 100% + 3300 @ 35%) = (3000VA + 1155VA)	= 4155VA
1 Central heating branch circuit—(12A × 120V)	= 1440VA
Initial net computed load	= 5595VA
5 Two-wire branch circuits total—Computed load (23A)	

This load is computed the same way under both the 1996 and 1999 codes.

According to 230-79(c) in the 1999 NEC, this dwelling unit is required to have a minimum 100-ampere service disconnect.

According to 230-79(c) and (d) in the 1996 NEC this dwelling would have been required to have a minimum 60-ampere service disconnect, because there are less than six 2-wire branch circuits and the initial net computed load is less than 10kVA.

Background and Explanation

The substantiation provided for this change was "To reflect current building practices." The example given here is obviously simplistic and is offered to illustrate the difference between the 1996 and 1999 codes. If a single-dwelling unit with the same characteristics were part of a multifamily dwelling, the 60-ampere rated disconnect would still be permitted.

Section 230-42(b) was also changed to require the ungrounded service-entrance conductors to have a rating equal to the service-disconnect rating. That change is discussed separately.

230-92 Accessibility of Service Overcurrent Devices

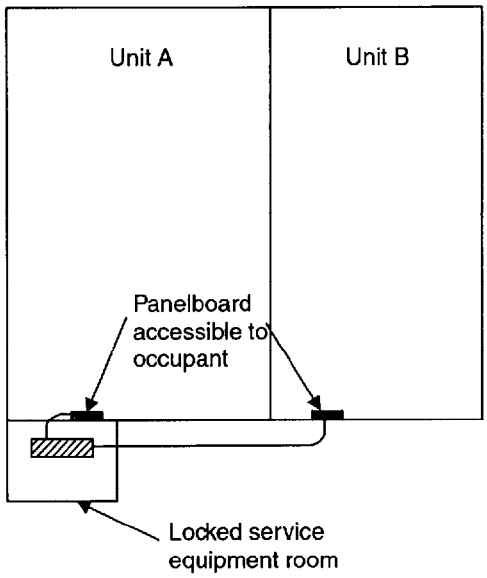
Type of Change Revision

BRIEF SUMMARY

All occupancies. Requirements where the service overcurrent device is not readily accessible or is locked or sealed are clarified.

Code Language

230-92. Locked Service Overcurrent Devices. Where the service overcurrent devices are locked or sealed, or not readily accessible **to the occupant,** branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of lower ampere rating than the service overcurrent device. (ROP 4-170)



Service Overcurrent Device Not Required to Be Accessible to Each Occupant

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:58 2005

Application

Section 230-72(c) Exception allows the service disconnect means to be under management control. In this situation the disconnect may not be readily accessible to each occupant of a multiple-occupancy building. In applications of this type the branch-circuit overcurrent devices must be readily accessible and of a lower rating than the service overcurrent protection.

Background and Explanation

Section 230-92 was revised to clarify the requirements for placement and accessibility of service overcurrent devices. The occupants of a multiple-occupancy building are not required to have access to the service overcurrent devices. This change correlates with similar language found in Section 240-24(b) 1.

230-204 Visible-Break Contacts for Isolating Switches

Type of Change Revision

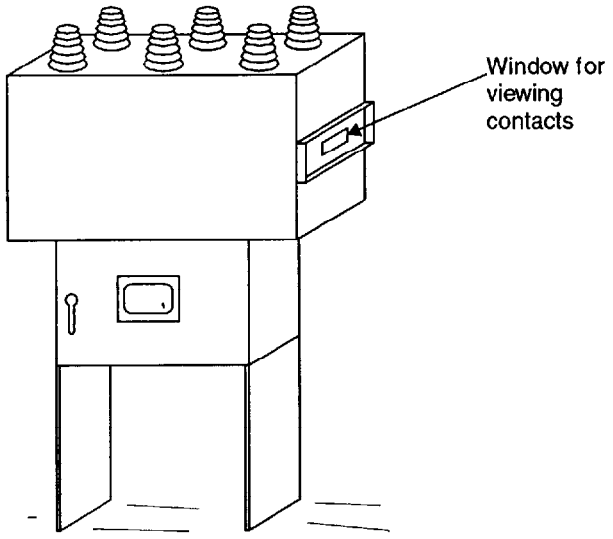
BRIEF SUMMARY

Industrial and commercial. Isolating switches must have visible-break contacts but are not required to be air-break types.

Code Language

230-204. Isolating Switches.

(a) Where Required. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute the service disconnecting means, **an isolating switch with visible break contacts** shall be installed on the supply side of the disconnecting means and all associated service equipment. (ROP 4-172)



SF_6 Switch with visible break contacts

Isolating Switches

Copyright by the National Fire Protection Association
Wed Feb 02 02:30:59 2005

Application

When oil switches or air, oil, vacuum, or sulphur hexafluoride circuit breakers are used as service disconnects on services over 600 volts, an isolating switch must be provided ahead of the service disconnect. This isolating switch must have visible-break contacts but is no longer required to be only the air-break type.

Background and Explanation

This change was made to provide additional options for isolating switches and to harmonize with the National Electrical Safety Code. The NEC has previously specified an air-break type of isolating switch, but this change allows other constructions with visible-break contacts. By requiring visible break contacts on the isolating switch, maintenance personnel can easily determine whether they are open or closed.

230-205(c) Remote Control for Disconnects Over 600 Volts

Type of Change New

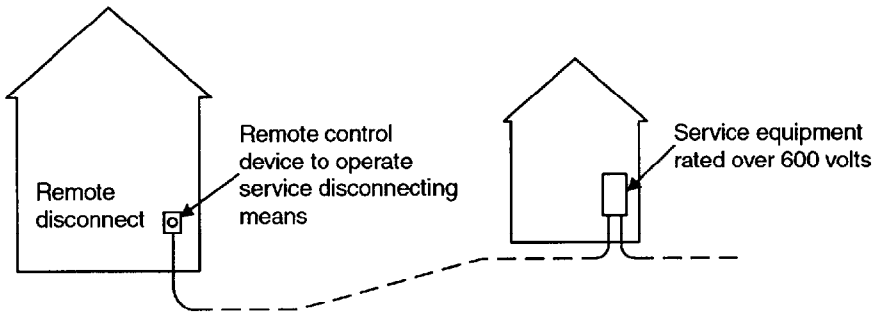
BRIEF SUMMARY

Industrial. Allows remote operation of medium-voltage disconnects.

Code Language

230-205. Disconnecting Means.

(c) Remote Control. For multibuilding, industrial installations under single management, the service disconnecting means shall be permitted to be located at a separate building or structure. In such cases, the service disconnecting means shall be permitted to be electrically operated by a readily accessible, remote-control device. (ROP 4-173) (ROC 4-108)



Service Disconnecting Arrangment for Over 600-Volt Multibuilding Industrial Complex

Application

In some industrial applications the service equipment is located in an outdoor substation. Each individual building is then supplied from one of the remotely located service disconnects. Remote operation of the service disconnect is permitted to be done from each building.

This method allows a means for safely disconnecting each building and eliminates the need to provide a medium-voltage switch at the termination of the conductors.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:00 2005

Background and Explanation

Prior to the 1996 NEC this method was allowed. However, some Article 230 material was relocated to Articles 225 and 710 in 1996. The allowance for remote operation was deleted from the NEC in the 1996 edition. This new section with similar text from previous codes allows a common industry practice to continue.

240-3(d) Small Conductor Overcurrent Protection Limits

Type of Change Relocation

BRIEF SUMMARY

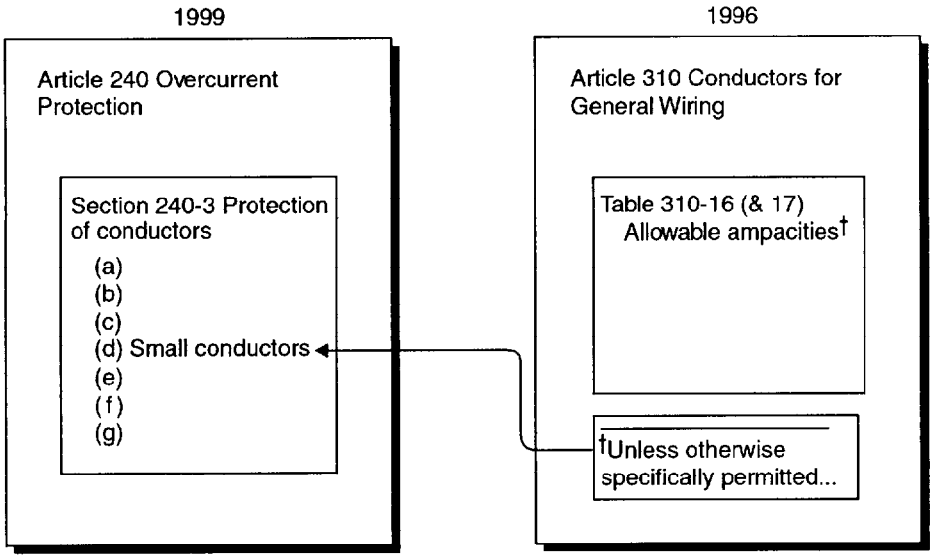
All installations. The "obelisk note" information from the ampacity Tables 310-16 and 310-17 is relocated.

Code Language

240-3. Protection of Conductors.

•
•
•

(d) Small Conductors. Unless specifically permitted in (e) through (g), the overcurrent protection shall not exceed 15 amperes for No. 14, 20 amperes for No. 12, and 30 amperes for No. 10 copper; or 15 amperes for No. 12 and 25 amperes for No. 10 aluminum and copper-clad aluminum after any correction factors for ambient temperature and number of conductors have been applied. (ROP 10-11)



"Obelisk Note" Relocated

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:00 2005

Application

The practical application of this rule has not changed. The overcurrent protection for small conductors, sizes No. 14, No. 12, and No. 10 AWG copper, are limited to 15, 20, and 30 ampere ratings, respectively. The overcurrent protection for small conductors sizes No. 12 and No. 10 AWG aluminum are limited to 15- and 25-ampere ratings, respectively. Other rules in Section 240-3, such as those for motors, air-conditioning equipment, and welders, permit the use of higher overcurrent device ratings for these conductor sizes.

Background and Explanation

This change was made primarily to improve the usability of the NEC. The obelisk note has been in Tables 310-16 and 310-17 in one form or another for over 30 years. Although the tables are used in determining ampacities, the obelisk note specifically limited the size of overcurrent protection for conductor sizes No. 14–No. 10 and was not a limit on the ampacity of small conductors. Moving this note to Article 240 puts the rule in a more appropriate location.

Much confusion has resulted from the obelisk note phrase "unless otherwise specifically permitted elsewhere in this code..." as well as from the fact that the rule had nothing to do with the ampacity of the conductors. Where would this specific permission be expected to be found? The specific permission was where it still remains, in Section 240-3. Section 240-3 gives specific permission to use the rules of Articles 430, 440, and 630 for sizing of conductor overcurrent protection. All of these articles provide separate rules for sizing conductors and selecting overcurrent protection. Conductors supplying motors and welders are usually allowed to have overcurrent protection rated at a value greater than the ampacity of the conductors they protect. Now the rule refers to the location of the specific permission, which can be found in Section 240-3 (e) through (g).

An asterisk note referencing Section 240-3 has been placed below Tables 310-16 and 310-17 to alert the user of the code where the requirements for overcurrent protection of small conductors (No. 14–No. 10) is now located.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:00 2005

240-3(e) Tap Conductor Definition

Type of Change Revision

BRIEF SUMMARY

All occupancies. The meaning of the term "tap" as used in Article 240 is clarified.

Code Language

240-3. Protection of Conductors. Conductors, other than flexible cords and fixture wires, shall be protected against overcurrent in accordance with their ampacities as specified in Section 310-15, unless otherwise permitted or required in (a) through (g). (ROP 10-13a)

•
•
•

(e) Tap Conductors. Tap conductors shall be permitted to be protected against overcurrent in accordance with Sections 210-19(d), 240-21, 364-11, 364-12, and 430-53(d).

As used in this article, *a tap conductor* is defined as a conductor, other than a service conductor that has overcurrent protection ahead of its point of supply, that exceeds the value permitted for similar conductors that are protected as described elsewhere in this section. (ROP 10-11, 10-12)

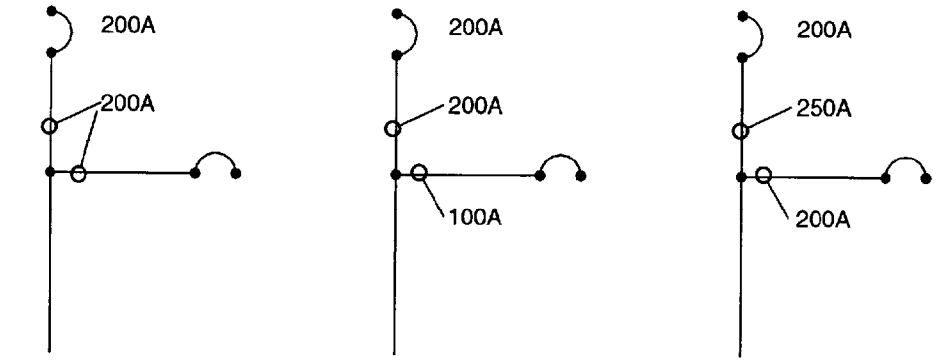


Figure B Meets New Definition of Tap Conductors.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:01 2005

Application

The term "tap" is used throughout the code and several different meanings may be applied. The use of the term in Article 240 is only related to overcurrent protection. The Article 240 rules for tap conductors are to be applied only where the rating of the overcurrent is larger than the allowable rating of the device permitted for the conductor involved.

Background and Explanation

The term "tap" is used in many ways, both in the NEC and in the field. While not an Article 100 definition, this revision assigns a clear meaning to the term as used in Article 240. Branch circuit taps, feeder and transformer secondary taps, busway taps, and motor circuit taps are covered by this Article 240 definition.

Wed Feb 02 02:31:01 2005

240-3(g) Revised Format for Overcurrent Protection Rules

Type of Change Reorganization

BRIEF SUMMARY

All installations. Section 240-3 has been reorganized, with many references to other articles placed in a table.

Code Language

240-3. Protection of Conductors.

(g) Overcurrent Protection for Specific Conductor Applications. Overcurrent protection for the specific conductors shall be permitted to be provided as referenced in the following list.

Air-conditioning and refrigeration equipment circuit conductors	Article 440, Parts C and F
Capacitor circuit conductors	Article 460, Sections 460-8(b) and 460-25(a) through (d)
Control and instrumentation circuit conductors (Type ITC)	Section 727-9
Electric welder circuit conductors	Article 630, Sections 630-12 and 630-32
Fire alarm system circuit conductors	Article 760, Sections 760-23, 760-24, 760-41 and Chapter 9, Tables 12(a) and 12(b)
Motor-operated appliance circuit conductors	Article 422, Part B
Motor and motor-control circuit conductors	Article 430, Parts C, D, E, F, and H
Phase converter supply conductors	Article 455, Section 455-7
Remote-control, signaling, and power-limited circuit conductors	Article 725, Sections 725-23, 725-24, 725-41, and Chapter 9, Tables 11(a) and 11(b)
Secondary tie conductors	Article 450, Section 450-6

(ROP 10-13a, ROC 10-8)

Application

Section 240-3 provides a list of rules for overcurrent protection of conductors. Much of Section 240-3 refers the user to other articles for the protection of conductors supplying specific types of loads. Those other articles are now listed in Section 240-3(g).

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:02 2005

Background and Explanation

This change makes Section 240-3 easier to use. No technical requirements other than the reference to Type ITC cable were changed by this reorganization. The former 240-3(i), concerning overcurrent protection for transformer secondary conductors, has been renumbered as 240-3(f). The remaining rules in 240-3(e) through (m) were just references to and permission to use other articles and have been replaced by a list of references to other articles. The format will make this section more user friendly.

Wed Feb 02 02:31:02 2005

240-4(b)(3) Field-Assembled Extension Cord Sets

Type of Change Revision

BRIEF SUMMARY

All installations. Field-assembled cord sets with conductors size No. 16 or larger are permitted to be protected by 20-ampere overcurrent devices.

Code Language

240-4. Protection of Flexible Cords and Fixture Wires.

(3) Extension Cord Sets. Flexible cord used in listed extension cord sets, **or in extension cords made with separately listed and installed components,**

Cord Conductor Size	Listed Cord Set		Field-Assembled from Listed Components	
	Overcurrent Protection		Overcurrent Protection	
	1996 NEC	1999 NEC	1996 NEC	1999 NEC
No.16 AWG	20A	20A	10A Ampacity table 400-5(A)	20A
No.14 AWG	20A	20A	15A Ampacity table 400-5(A)	20A
No.12 AWG	20A or Table 400-5(A)	20A or Table 400-5(A)	20-25A Ampacity table 400-5(A)	20A or Table 400-5(A)

Protection of Cord Sets

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:02 2005

shall be permitted to be supplied by a branch circuit of Article 210 in accordance with the following: 20-ampere circuits—No. 16 and larger (ROP 10-26, 10-27) (ROC 10-17)

Application

Cord sets may be assembled in the field from listed components. Such cords, with conductors sized No. 16 or larger, may now be supplied and protected by 20-ampere circuits. The table illustration shows the differences between the protection requirements for flexible cords in the 1996 and 1999 edition of the NEC.

Background and Explanation

Prior to this change, only cords in listed extension cord sets were permitted to be protected by overcurrent devices rated higher than the ampacity of the cords. Other cords and field assembled extension cords were required to be protected at their ampacities. Cord ampacities are listed in Tables 400-5(A) and 400-5(B). This change allows No. 16 AWG cords assembled in the field using listed attachment plugs and receptacle bodies (also known as cord caps and connectors) to be protected by a 20-ampere overcurrent protection device.

240-21 Tap Conductor Rules

Type of Change Reorganization

BRIEF SUMMARY

All installations. The "tap rules" have been reorganized, with the rules for feeder taps separated from the rules for transformer secondary conductors.

Code Language

240-21. Location in Circuit. Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply, **except as specified in (a) through (g). No conductor supplied under the provisions of (a) through (g) shall supply another conductor under those provisions, except through an overcurrent protective device meeting the requirements of Section 240-3.** (ROP 10-54, 10-56) (ROC 10-40)

Outline of revised Section 240-21:

240-21 Location in Circuit
- 240-21(a) Branch Circuit Conductors
- 240-21(b) Feeder Taps
  - 240-21(b)(1) Taps Not over 10 Ft. Long
  - 240-21(b)(2) Taps Not over 25 Ft. Long
  - 240-21(b)(3) Taps Supplying a Transformer
  - 240-21(b)(4) Taps over 25 Ft. Long
  - 240-21(b)(5) Outside Taps of Unlimited Length
- 240-21(c) Transformer Secondary Conductors
  - 240-21(c)(1) Protection by Primary Overcurrent Device
  - 240-21(c)(2) Transformer Secondary Conductors Not over 10 Ft. Long
  - 240-21(c)(3) Secondary Conductors Not over 25 Ft. Long
  - 240-21(c)(4) Outside Secondary Conductors
  - 240-21(c)(5) Secondary Conductors from a Feeder Tapped Transformer
- 240-21(d) Service Conductors
- 240-21(e) Busway Taps
- 240-21(f) Motor Circuit Taps
- 240-21(g) Conductors from Generator Terminals

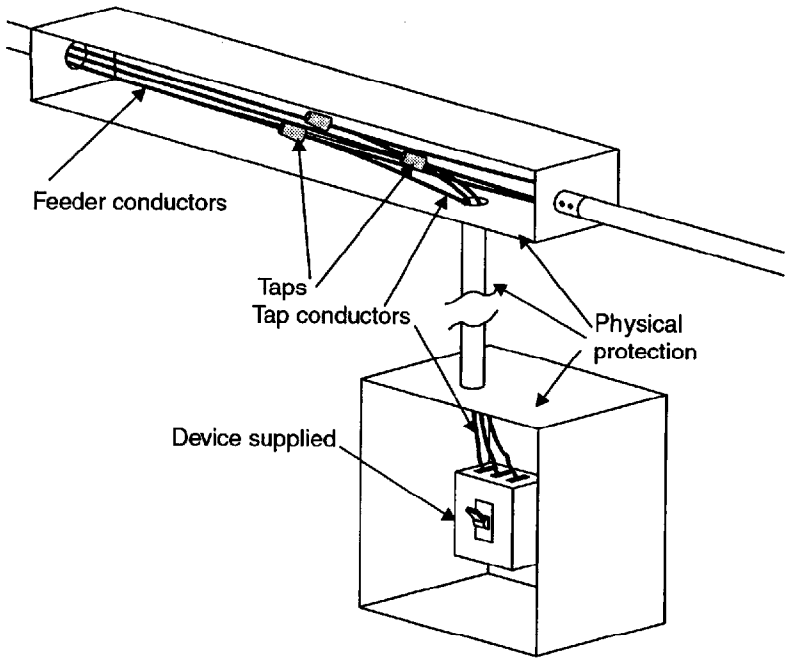

Figure 1. Tap Conductors

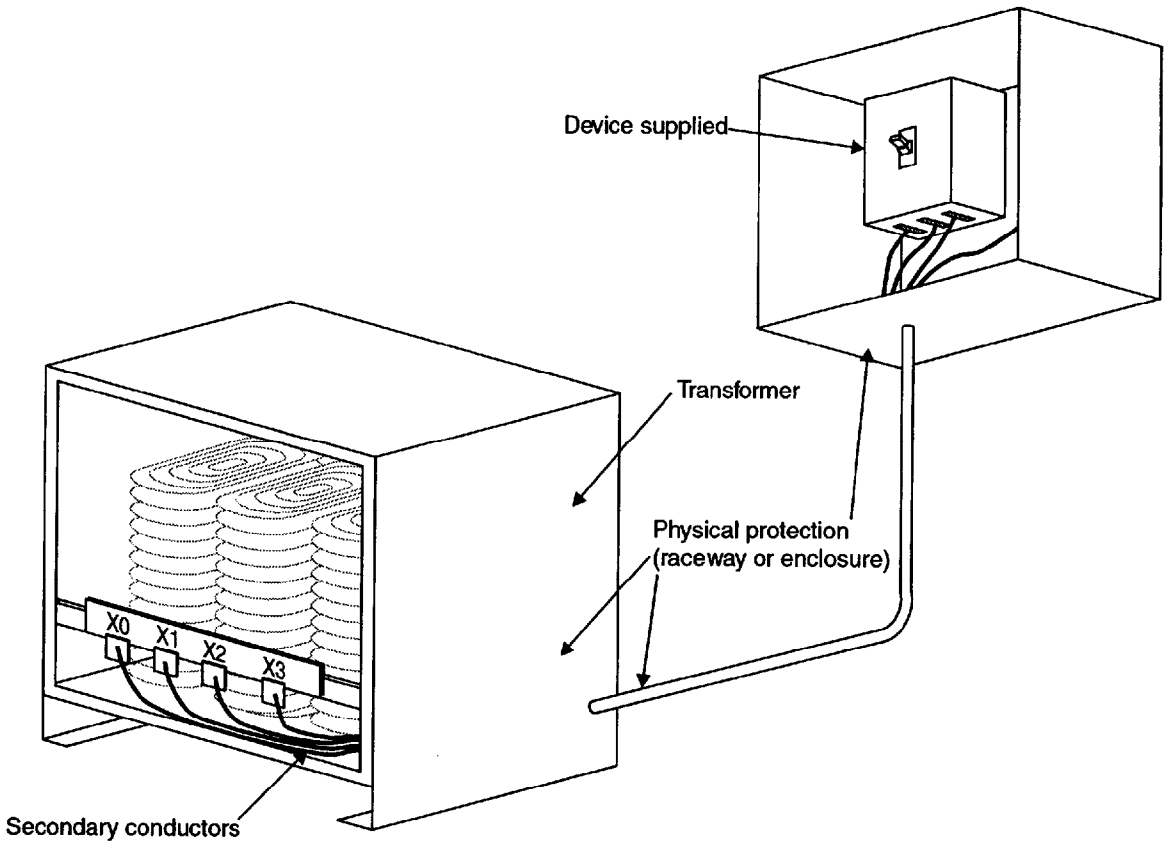

Figure 2. Transformer Secondary Conductors

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:03 2005

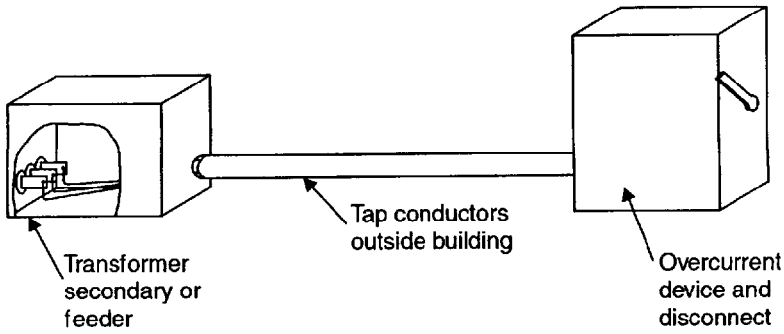

Figure 3. Outside Feeder Taps and Transformer Secondary Conductors

Application

This section contains what are often called the "tap rules." The effect and application of the tap rules have not been modified significantly by this reorganization. The outline of Section 240-21 shows that the rules for transformer secondary conductors have been separated from the rules for feeder taps. The general rule of Section 240-21 is that conductors will be protected where they receive their supply. Subsections 240-21(a) through 240-21(g) modify this general rule.

Figure 1 illustrates tap conductors connected to a feeder. Feeder taps are covered by Section 240-21(b), which is divided into five specific conditions. The variations in the five conditions in the feeder tap rules are based on five general factors: one, the length of the tap conductors; two, the ampacity of the tap conductors, including their adequacy for the load and their size relative to the protective device for the conductors from which the taps are made; three, the rating of the device or equipment supplied; four, the type of device or equipment supplied; and five, the physical protection provided by enclosure and sometimes elevation.

Figure 2 illustrates transformer secondary tap conductors. Transformer secondary conductors are covered by Section 240-21(c), which is also divided into five specific conditions. However, in this case the fifth condition, 240-21(c)(5), refers back to 240-21(b)(3) for taps supplying a transformer. The variations in the conditions for transformer secondary conductors are based on eight general factors: one, the length of the secondary conductors; two, the type of transformer; three, the rating of the primary overcurrent protection; four, the ampacity of the secondary conductors; five, the rating of the device or equipment supplied; six, the type of equipment or device supplied; seven, the location of the device supplied; and eight, the protection of the conductors by enclosure or location. Not all of these eight factors are considered by every rule.

Figure 3 illustrates an outside feeder tap of unlimited length. The conductors are required to terminate in a single set of fuses or a single circuit breaker that limits the load to the ampacity of the tap conductors.

A new Part H of Article 240 covers supervised industrial installations. The new part may modify some of the rules in this section for such installations. An example of such modifications is permission to use tap conductors at increased lengths. This change is covered separately.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:04 2005

Background and Explanation

This change was made to improve the usability of Section 240-21. The previous intermixing of the rules for feeder taps and transformer secondary conductors have been sorted out to enable users of the code to determine specifically which rules apply to feeder tap conductors and which rules apply to transformer secondary conductors. In order to apply the rules of the previous version of Section 240-21 to transformer secondary conductors, it was necessary to identify transformer secondary conductors as "tap conductors" in order to apply the intended rules.

240-21 Tapping a Tap Conductor Prohibited

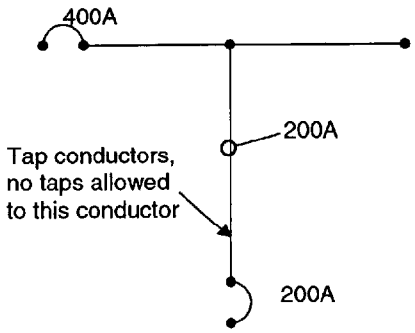
Type of Change Revision

BRIEF SUMMARY

All occupancies. Entire section has been clarified for ease of use.

Code Language

240-21. Location in Circuit. Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply, **except as specified in (a) through (g). No conductor supplied under the provisions of (a) through (g) shall supply another conductor under those provisions, except through an overcurrent protective device meeting the requirements of Section 240-3.** (ROP 10-54, 10-56) (ROC 10-40)



Additional Tap Conductor Connections Cannot Be Made to Individual Tap Conductors.

Background and Explanation

The main rule of Section 240-21 has been revised. This rule now makes it clear that an additional connection cannot be made to a tap conductor ahead of the required overcurrent protection. Inspectors and users have frequently expressed the concept as "you can't tap a tap." This is of particular concern when conductors are tapped from a set of parallel conductors. The individual conductors that

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:04 2005

comprise the parallel circuit would themselves be considered as taps when a tap is not connected to all of the conductors (of a particular phase, grounded conductor, or neutral) in the parallel arrangement. The revised format makes a clear distinction between rules for conductors tapped to a feeder and those for conductors connected to the secondary of a transformer.

240-86 Motor Contribution to Series Ratings

Type of Change New

BRIEF SUMMARY

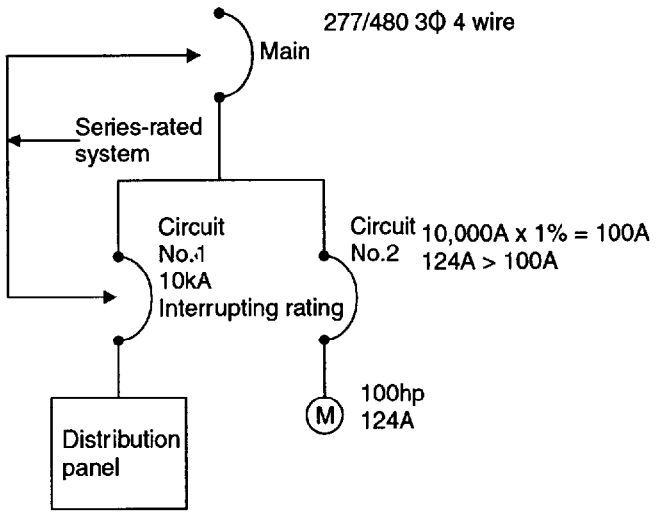
Commercial and industrial. Some use of series-rated systems where motor loads may contribute to short circuit current is restricted.

Code Language

240-86. Series Ratings.

(b) Motor Contribution. Series ratings shall not be used where

(1) Motors are connected on the load side of the higher-rated overcurrent device and on the line side of the lower-rated overcurrent device.
(2) The sum of the motor full-load currents exceeds 1 percent of the interrupting rating of the lower-rated circuit breaker. (ROP 10-114)



Impact of Motor Contribution to Series-Rated System

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:05 2005

Application

Where motor loads are connected between two series-rated devices, the lower-rated (downstream) device can be subjected to more fault current than it was during the series testing.The series rating of the overcurrent protection devices for the Main and Circuit No.1 in the illustration cannot be used where motor FLC exceeds 1 percent of Feeder No.1 OCPD interrupting rating.

This new section is intended to restrict the use of series-rated systems where motors are connected between series-rated devices.

Background and Explanation

This change recognizes that a motor becomes a generator when de-energized and still rotating and can contribute to the available fault current in the system. When series-rated systems are evaluated, it is not known whether there will be motors in a particular facility and, where there are motors, what the size will be. Therefore an accurate evaluation of the motor contribution to the available fault current can only be made on a case-by-case basis. This engineering information can then be used to select the properly rated equipment.

NEC pp. 78–79

Article 240
Part H Supervised Industrial Installations

Type of Change New

BRIEF SUMMARY

Industrial. A new Part H, which includes Sections 240-90, 240-91, and 240-92, defines and provides special rules for supervised industrial installations.

Code Language

H. Supervised Industrial Installations

240-90. General. Overcurrent protection in areas of supervised industrial installations shall comply with all the applicable provisions of the other sections of this article, except as provided in Part H. The provisions of Part H shall only be permitted to apply to those portions of the electrical system in the supervised industrial installation used exclusively for manufacturing or process control activities. (ROP 10-115a) (ROC 10-93)

240-91. Definition of Supervised Industrial Installation. For the purposes of Part H, *Supervised Industrial Installation* is defined as the industrial portions of a facility where all of the following conditions are met.

(1) Where conditions of maintenance and engineering supervision ensure that only qualified persons will monitor and service the system.

(2) The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.

(3) The premises has at least one service that is more than 150 volts to ground and more than 300 volts phase-to-phase.

This definition shall not apply to those installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center. (ROP 10-115b) (ROC 10-93)

240-92. Location in Circuit. An overcurrent device shall be connected in each ungrounded circuit conductor as follows. (ROP 10-115c)

(a) Feeder and Branch-Circuit Conductors. Feeder and branch-circuit conductors shall be protected at the point the conductors receive their supply, as permitted in Section 240-21, or as otherwise permitted in (b) or (c).

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:05 2005

(b) Transformer Secondary Conductors of Separately Derived Systems. Conductors shall be permitted to be connected to a transformer secondary of a separately derived system, without overcurrent protection at the connection, where the conditions of (1), (2), and (3) are met:

(1) Short-Circuit and Ground-Fault Protection. The conductors shall be protected from short-circuit and ground-fault conditions by complying with one of the following conditions.

(a) The length of the secondary conductors does not exceed 50 ft (15.24 m) and the transformer primary overcurrent device has a rating or setting that does not exceed 150 percent of the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.

(b) The length of the secondary conductors does not exceed 75 ft (22.86 m) and the conductors are protected by a differential relay with a trip setting equal to or less than the conductor ampacity.

(c) The conductors shall be considered to be protected if the length of the secondary conductors does not exceed 75 ft (22.86 m) and if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions.

(2) Overload Protection. The conductors shall be protected against overload conditions by complying with one of the following.

(a) The conductors terminate in a single overcurrent device that will limit the load to the conductor ampacity.

(b) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location.

(c) Overcurrent relaying is connected [with a current transformer(s), if needed] to sense all of the secondary conductor current and limit the load to the conductor ampacity by opening upstream or downstream devices.

(d) Conductors shall be considered to be protected if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors from overload conditions.

(3) Physical Protection. The secondary conductors shall be suitably protected from physical damage.

(c) Outside Feeder Taps. Outside conductors shall be permitted to be tapped to a feeder or to be connected at a transformer secondary, without overcurrent protection at the tap or connection, where all the following conditions are met.

(1) The conductors are suitably protected from physical damage.

(2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses mounted in a single enclosure, in a group of separate enclosures, or in or on a

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:06 2005

switchboard. There shall be no more than six overcurrent devices grouped in any one location.

(3) The tap conductors are installed outdoors, except at the point of termination.

(4) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

(5) The disconnecting means for the conductors are installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the conductors. (ROP 10-115c)

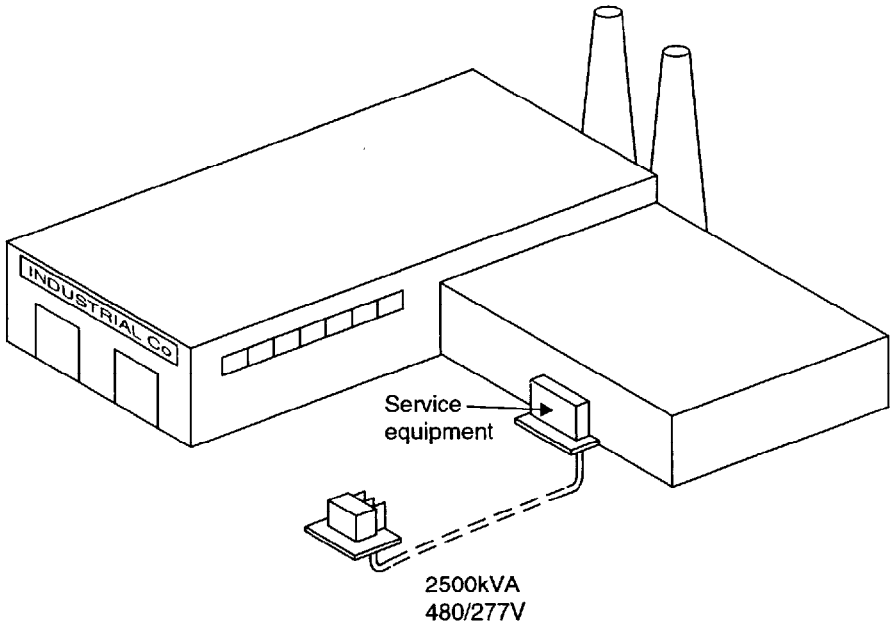

Figure 1. Supervised Industrial Installation

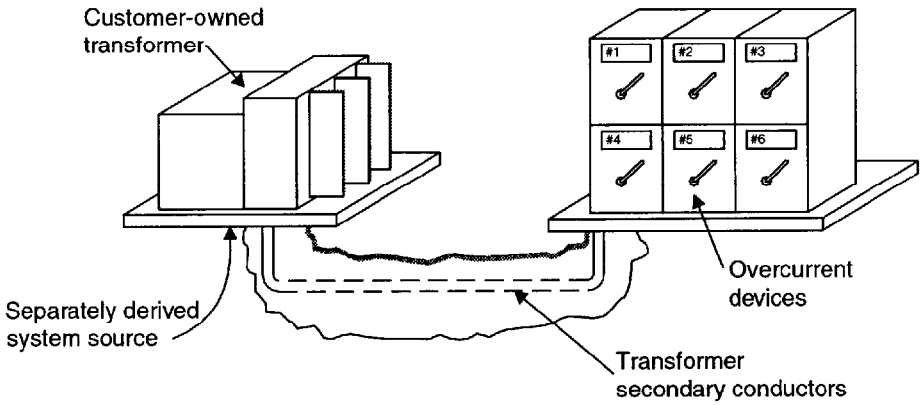

Figure 2. Supervised Industrial Installation—Separately Derived System

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:06 2005

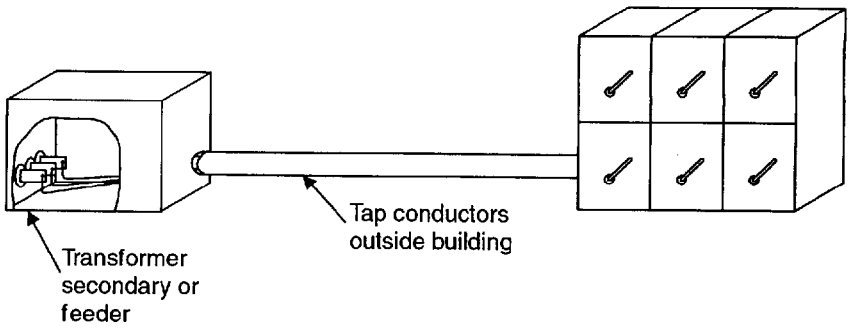

Figure 3. Supervised Industrial Installation—Outside Feeder Taps and Transformer Secondary Conductors

Application

A new Part H to Article 240 permits special rules for overcurrent protection to be used in supervised industrial locations. These rules modify some of the general requirements of Article 240, primarily those in Section 240-21. Except as modified by Part H, the provisions of Article 240 still apply to these installations.

Figure 1 illustrates the definition of a supervised industrial location as given in Section 240-91. A supervised industrial location must have three characteristics: It must be an industrial premises wiring system that supplies an industrial or manufacturing process or both; it must have engineering and maintenance supervision that ensures that servicing will be done only by qualified persons; and it must have at least one service at a voltage of not less than 150 volts to ground and not less than 300 volts phase to phase. The premises wiring system must serve a load of at least 2500kVA calculated according to Article 220. This minimum load would be approximately equivalent to a minimum 480/277-volt, 3-phase, 3000-ampere service. (2500000VA/(480V × 1.73) = 3011). Figure 1 shows a single service that meets the requirements of the definition. However, the load is not required to be served by a single service.

The rules of Part H apply only to those portions of an installation used exclusively for manufacturing or process control, and do not apply to parts of the facility used for other purposes.

A significant new rule of Part H is contained in Section 240-92. Section 240-92(a) states that branch-circuit and feeder conductors must be protected in accordance with Section 240-21 unless they qualify for coverage under the special tap rules in Section 240-92(b) or (c).

Figure 2 illustrates the conditions covered by Section 240-92(b). This section provides the rules for the overcurrent protection of transformer secondary conductors supplied by a separately derived system. These conductors need not meet the usual requirements of Section 240-21. If Section 240-92(b) is used, transformer secondary conductors are required to have short-circuit and ground-fault protection, overload protection, and physical protection.

Section 240-92(b)(1) allows short-circuit and ground-fault protection to be provided in one of the following three ways:

1. The conductors are subject to a 50-ft length limit, and the primary overcurrent device rating is not more than 150 percent of the product of the secondary conductor ampacity and the secondary-to-primary voltage ratio; or

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:06 2005

2. The conductors are subject to a 75-ft length limit, and the secondary conductors are protected by a differential relay with a trip setting not higher than the conductor ampacity; or
3. The conductors are subject to a 75-ft length limit, and engineering calculations determine that the secondary conductors are protected from short circuits and ground faults.

Section 240-92(b)(2) allows overload protection to be provided by limiting the load to the ampacity of the conductors in one of four ways:

1. By a single overcurrent device at the load end of the conductors; or
2. By the sum of up to six overcurrent devices grouped in one location; or
3. By overcurrent relays that operate either upstream or downstream overcurrent devices; or
4. By engineering calculations that determine that system overcurrent devices will protect the conductors from overload.

Section 240-92(b)(3) requires physical protection that is suitable for the conditions.

Figure 3 illustrates the conditions covered by Section 240-92(c). This section provides rules for overcurrent protection of outside feeder taps. The conductors in this case may be tapped from a feeder or a transformer secondary, must remain outdoors except at the point of termination, and must be protected from physical damage. In addition, overcurrent protection must be provided by not more than six overcurrent devices grouped in one location. The sum of the ratings of the overcurrent devices cannot exceed the ampacity of the conductors. The overcurrent device must be an integral part of the disconnecting means or be located immediately adjacent to the disconnecting means, and the disconnecting means must be located outside or inside the nearest point of entrance of the conductors into the building.

Background and Explanation

This new part was added to address the special needs of large industrial users. The definition of "supervised industrial locations" was intended to cover only large industrial installations and to exclude smaller industrial and all commercial installations. The main effect of the new part is to provide for special tap rules for large transformers and outside feeders.

The new tap rules for these large industrial installations vary from the usual rules in a number of different ways:

- First, overcurrent protection may be provided by engineering design and calculation without conformance to specific methods spelled out by the code.
- Second, overcurrent protection may be broken up into separate devices that provide short-circuit and ground-fault protection in one device and overload protection in another device. This concept is similar to the way motor circuits are protected: with short-circuit and ground-fault protection at the source, and separate overload protection near the load end of the conductors.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:07 2005

- Third, different methods or devices are recognized for overcurrent protection. Whereas under the usual provisions of the code overcurrent devices are generally understood to be circuit breakers or fuses, these rules allow for the use of differential relays and overcurrent relaying as protective devices.
- Fourth, conductor length limits are generally longer than for other types of installations.

Like some other tap rules, overcurrent protection may be separate devices that provide short-circuit and ground-fault protection in one device and overload protection in another device.

240-100 Overcurrent Protection for Circuits Over 600 Volts

Type of Change Relocation and Revision

BRIEF SUMMARY

Commercial and industrial. Article 240 Part H was changed to Part I, rearranged, and combined with overcurrent protection rules from the deleted Article 710.

Code Language

240-100. Feeders and Branch Circuits. (ROP 13-35)

(a) **Feeder and branch-circuit conductors shall have overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply or at a location in the circuit determined under engineering supervision. The overcurrent protection shall be permitted to be provided by one of the following.** (ROC 10-97)

(1) Overcurrent Relays and Current Transformers. Circuit breakers used for overcurrent protection of 3-phase circuits shall have a minimum of three overcurrent relays operated from three current transformers. On 3-phase, 3-wire circuits, an overcurrent relay in the residual circuit of the current transformers shall be permitted to replace one of the phase relays.

An overcurrent relay, operated from a current transformer that links all phases of a 3-phase, 3-wire circuit, shall be permitted to replace the residual relay and one of the phase-conductor current transformers. Where the neutral is not regrounded on the load side of the circuit as permitted in Section 250-184(b), the current transformer shall be permitted to link all 3-phase conductors and the grounded circuit conductor (neutral). (ROP 10-5, 13-35)

(2) Fuses. A fuse shall be connected in series with each ungrounded conductor. (ROP 13-35)

(b) Protective Devices. The protective device(s) shall be capable of detecting and interrupting all values of current that can occur at their location in excess of their trip setting or melting point.

(c) Conductor Protection. The operating time of the protective device, the available short-circuit current, and the conductor used shall be coordinated to prevent damaging or dangerous temperatures in conductors or conductor insulation under short-circuit conditions.

240-101. Additional Requirements for Feeders. (ROP 10-5)

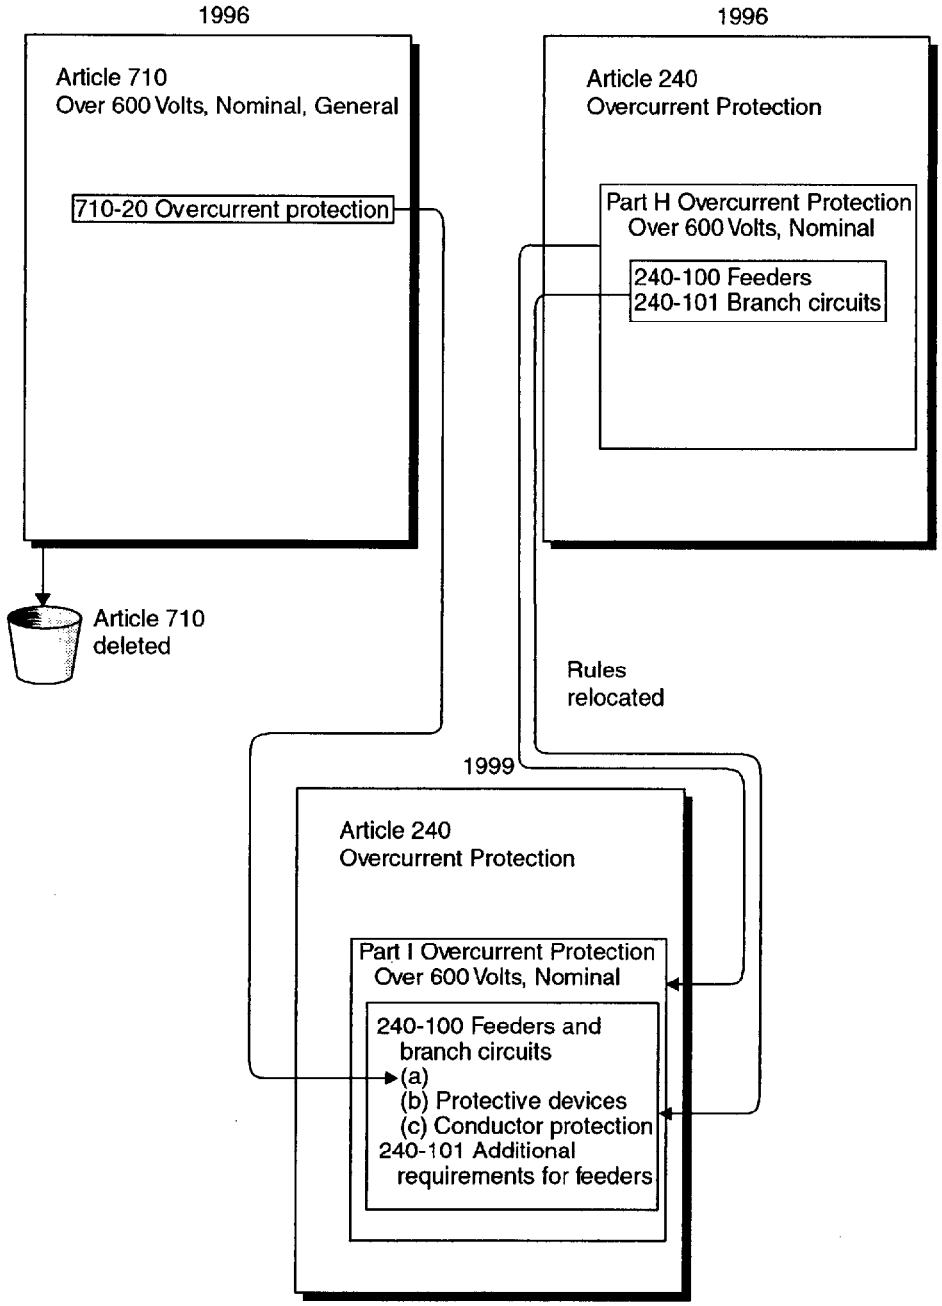
(a) Rating or Setting of Overcurrent Protective Devices. The continuous ampere rating of a fuse shall not exceed three times the ampacity of the conductors. The long-time trip element setting of a breaker or the minimum trip setting of an electronically actuated fuse shall not exceed six times the ampacity of the

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:07 2005

conductor. For fire pumps, conductors shall be permitted to be protected for overcurrent in accordance with Section 695-4(b).

(b) Feeder Taps. Conductors tapped to a feeder shall be permitted to be protected by the feeder overcurrent device where that overcurrent device also protects the tap conductor.

(TCC 13-35)



High Voltage Rules Relocated

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:08 2005

Application

The illustration shows the origin and new location of the relocated and rearranged sections. The rules on overcurrent protection for over 600 volts are now grouped in Sections 240-100 and 240-101. Section 240-100 now requires overcurrent protection to be located either where the conductors receive their supply or at a location determined under engineering supervision.

Background and Explanation

This change was part of the redistribution of Article 710 and the consolidation of requirements for over 600 volts. Part H of Article 240 was changed to Part I. Section 240-100 was combined with Section 240-101 and reorganized to become 240-100(a), (b), and (c) and 240-101(a) and (b). Section 710-20 was moved to Section 240-100(a) because it was concerned with overcurrent protection.

Section 240-100(a) was revised to clarify the location of overcurrent protective devices for feeders and branch circuits over 600 volts. Overload and short-circuit and ground-fault protection are required, but the location of the protective devices may be other than at the source of supply. For circuits over 600 volts, the revised rule permits the location to be determined under engineering supervision. However, without engineering supervision, the location of the overcurrent protection device is now clearly the same as for circuits of 600 volts or less: The overcurrent device(s) must be located where the conductors receive their supply.

A new Part H was added to cover supervised industrial locations. That change is discussed separately.

NEC pp. 80–103

Article 250 Grounding: Reorganization of Entire Article

Type of Change Revision

BRIEF SUMMARY

All occupancies. Extensive revision has been made of the entire article.

Code Language

See Appendix E table.

Application

The arrangement of Article 250 has been completely revised to enhance the usability of the article. Many of the requirements of previous editions of the code have been relocated into the new part of the article that contains similar subject matter. The format is intended to provide a more logical approach to grounding.

Background and Explanation

There have been many comments from users about the difficulty of using Article 250. Users have indicated that related language was not clearly grouped.

Through joint efforts of the NEC Usability Task Group, Code-Making panel 5, and proposals from users, a major revision was undertaken.

A few significant changes were made and will be discussed here separately. In general, the material in Article 250 has been rearranged for clarity and some exceptions have been revised into the main text of the code. Some duplication of requirements has been eliminated.

A new Appendix E has been added to cross reference old section numbers to new section numbers.

250-2 & 250-4 Grounding Performance Requirements

Type of Change

Relocation/Revision; Relocation

BRIEF SUMMARY

All installations. Grounding performance information in FPNs was converted to mandatory language and combined with former Section 250-51 as a new Section 250-2. The old Section 250-2 was renumbered as Section 250-4.

Code Language

250-2. General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section. (ROC 5-45)

(a) Grounding of Electrical Systems. Electrical systems that are required to be grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation. (ROC 5-45)

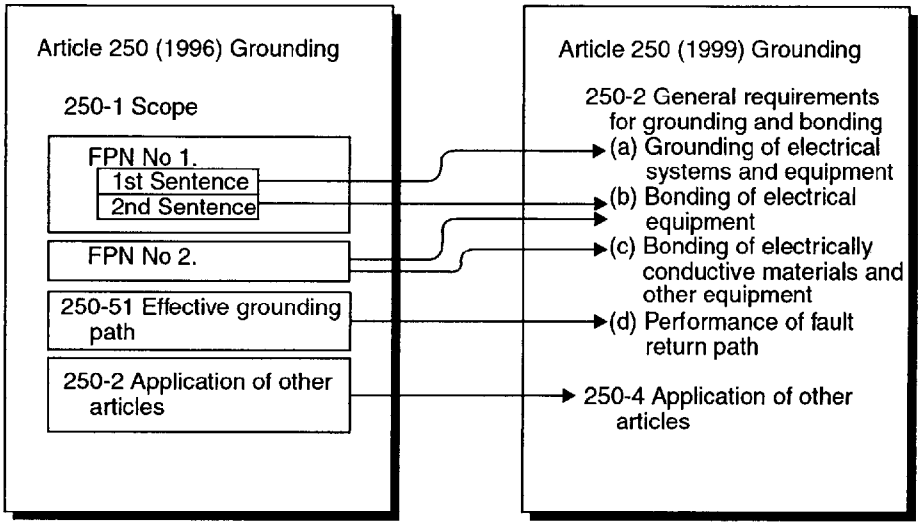
(b) Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials. Where the electrical system is required to be grounded, these materials shall be connected together and to the supply system grounded conductor as specified by this article. Where the electrical system is not solidly grounded, these materials shall be connected together in a manner that establishes an effective path for fault current. (ROC 5-45)

(c) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be bonded as specified by this article to the supply system grounded conductor or, in the case of an ungrounded electrical system, to the electrical system grounded equipment, in a manner that establishes an effective path for fault current. (ROC 5-45)

(d) Performance of Fault Current Path. The fault current path shall be permanent and electrically continuous, shall be capable of safely carrying the maximum fault likely to be imposed on it, and shall have sufficiently low impedance to facilitate the operation of overcurrent devices under fault conditions. (ROC 5-45)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:10 2005

The earth shall not be used as the sole equipment grounding conductor or fault current path.



Grounding Performance Requirements

Application

The FPNs following Section 250-1 have been converted to code requirements and combined with the previous Section 250-51 to form a new Section 250-2 "General Requirements for Grounding and Bonding." The previous Section 250-2 "Application of Other Articles" has been moved to Section 250-4.

The new Section 250-2 provides performance requirements for grounding and bonding. These code rules identify what is required to be accomplished by following the rules of Article 250. The performance requirements do not change the technical requirements of the code. Rather, they explain the reason for the requirements.

Background and Explanation

This change represents a departure from the usual nature of code rules. Most code rules say what to do, but seldom does the code tell us in mandatory language why we are to do something. Most such information is advisory, in the form of FPNs. As stated in the substantiation for this change: "The NEC provides requirements that, when followed, result in a safe electrical installation, but, because it is a prescriptive code, there is no explanation of how these requirements were established or what they are intended to accomplish." The submitter goes on to say: "These performance requirements will still be met by proper compliance with the existing prescriptive rules but installers will have a much better idea of what they are doing and why."

Most of what appears in Section 250-2 was formerly in two FPNs. The FPNs were reworded and recombined to group the subject matter into the new Section 250-2. The last sentences of Section 250-2(a) and (b) were added to explain the reasons for grounding and bonding equipment when the system is not grounded.

250-30(a) (1) & (2) Separately Derived System Grounding

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The requirements for grounding separately derived systems apply to all grounded systems, not only those required to be grounded. The bonding jumper and grounding electrode conductor connections to the grounded conductor of a separately derived system must be in the same location.

Code Language

250-30. Grounding Separately Derived Alternating-Current Systems.

(a) Grounded Systems. A separately derived ac system **that is grounded** shall comply with (1) through (4).

Exception: High-impedance grounded neutral system grounding connection requirements shall not be required to comply with (1) and (2) and shall be made as specified in Sections 250-36 and 250-186.

(1) Bonding Jumper. A bonding jumper in compliance with Sections 250-28(a) through (d), that is sized for the derived phase conductors, shall be used to connect the equipment grounding conductors of the separately derived system to the grounded conductor. Except as permitted by Section 250-24(a)(4), this connection shall be made at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices. **The point of connection shall be the same as the grounding electrode conductor as required in Section 250-30(a)(2).** (TCC 5-65)

Exception No. 1: A bonding jumper at both the source and the first disconnecting means shall be permitted where doing so does not establish a parallel path for the grounded circuit conductor. Where a grounded conductor is used in this manner, it shall not be smaller than the size specified for the bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth is not considered as providing a parallel path.

Exception No. 2: The size of the bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived phase conductors and shall not be smaller than No. 14 copper or No. 12 aluminum.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:10 2005

(2) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with Section 250-66 for the derived phase conductors, shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in (3). **Except as permitted by Sections 250-24(a)(3) or (a)(4), this connection shall be made at the same point on the separately derived system where the bonding jumper is installed.**

Exception: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with Section 250-30(a)(1), Exception No. 2, and the transformer frame or enclosure is grounded by one of the means specified in Section 250-134.

(3) Grounding Electrode. The grounding electrode shall be as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:

(a) An effectively grounded structural metal member of the structure
(b) An effectively grounded metal water pipe **within 5 ft (1.52 m) from the point of entrance into the building**

Exception: In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length of the interior metal water pipe that is being used for the grounding electrode is exposed, the connection shall be permitted at any point on the water pipe system.

(c) Other electrodes as specified in Sections 250-50 and 250-52 where the electrodes specified by (a) or (b) are not available

Exception for (a), (b), and (c): Where a separately derived system originates in listed equipment also used as service equipment, the grounding electrode used for the service equipment shall be permitted as the grounding electrode for the separately derived system provided the grounding electrode conductor from the service equipment to the grounding electrode is of sufficient size for the separately derived system. Where the equipment ground bus internal to the service equipment is not smaller than the required grounding electrode conductor, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

FPN: See Section 250-104(a)(4) for bonding requirements of interior metal water piping in the area served by separately derived systems.

(4) Grounding Methods. In all other respects, grounding methods shall comply with requirements prescribed in other parts of this *Code*.

Grounding Separately Derived Systems

Application

The requirements of Section 250-30(a) were extended to cover all grounded separately derived systems, not just those required to be grounded.

As in the 1996 NEC, the location of the bonding jumper and grounding electrode conductor connections to the grounded conductor of a separately derived system may be made at any location from the source to the first disconnecting means. However, under the 1999 NEC both connections must be in the same location. Bonding jumpers may be installed at both the source and the first disconnect if there is no conductive pathway paralleling the grounded conductor between the two bonding jumpers. Such an installation requires the grounded conductor to be at least as large as the size required for the bonding jumpers. Connection through the earth is not considered to be a parallel pathway, but parallel pathways created by metallic raceways, enclosures, building steel, or electrodes such as water piping are prohibited.

The illustration shows both the bonding jumper and grounding electrode connections at the source of a separately derived system. The dashed lines show that both connections could be made at the disconnecting means. According to the main rule, both connections must be made in the same location. Although the code allows the connections to be made at some point between these two locations, other connection points are usually not practical.

Background and Explanation

This is one of a number of changes that address the problem of parallel pathways that may be created by multiple grounding connections to the grounded conductor of a service or separately derived system. Similar changes were made to Section 250-32 for separate buildings.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:11 2005

Under the 1996 code, the location of the grounding electrode conductor and the bonding jumper connections to the grounded conductor could be selected independently. However, parallel pathways are often created where the two connections are not made at the same point.

Parallel pathways are also created by metallic raceways enclosing the derived system conductors. A parallel path will cause the currents on the grounded conductor to divide between the available pathways. Grounded conductor currents on raceways, bonding or grounding conductors, or through electrodes are considered objectionable currents under Section 250-6. This change clarifies the intent of the code to avoid such parallel paths and objectionable currents. The bonding jumper is intended to connect the grounded conductor to enclosures and equipment grounding conductors. The grounding electrode conductor is intended to connect the grounded conductor to ground reference through a grounding electrode. But the grounding electrode conductor must also be bonded to its enclosures, which, in effect, creates an additional bonding jumper.

Section 250-30(a)(1) Exception No. 1 permits bonding jumpers at both the source and the first disconnect if no parallel pathway is created. When this exception is used, the grounded conductor takes on the function of a bonding jumper. That is, the grounded conductor becomes the fault return path as well as a conductor for normal load currents or unbalanced currents. In such cases, the grounded conductor must be as large as the size required for the bonding jumpers. Parallel pathways would be likely if metallic raceways are used to enclose the derived system conductors. Such pathways would also be created if the enclosures at the source and the disconnect were both connected to building steel, especially where the building steel is used as an electrode.

Section 250-142 still allows the grounded conductor of a separately derived system to be used to ground equipment on the supply side of the disconnecting means, but only where the provisions of Section 250-30(a)(1) do not result in a parallel grounding path.

250-30(a)(3) Electrodes for Separately Derived Systems

Type of Change

Relocated and Revised

BRIEF SUMMARY

Commercial and industrial. These revisions clarify the selection of the grounding electrode for a separately derived system.

Code Language

250-30. Grounding Separately Derived Alternating-Current Systems.

(a) Grounded Systems. A separately derived ac system that is grounded shall comply with (1) through (4).

(3) Grounding Electrode. The grounding electrode shall be as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:

(a) An effectively grounded structural metal member of the structure

(b) An effectively grounded metal water pipe ***within 5 ft (1.52 m) from the point of entrance into the building***

Exception: In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length of the interior metal water pipe that is being used for the grounding electrode is exposed, the connection shall be permitted at any point on the water pipe system.

(c) Other electrodes as specified in Sections 250-50 and 250-52 where the electrodes specified by (a) or (b) are not available

Exception for (a), (b), and (c). Where a separately derived system originates in listed equipment also used as service equipment, the grounding electrode used for the service equipment shall be permitted as the grounding electrode for the separately derived system provided the grounding electrode conductor from the service equipment to the grounding electrode is of sufficient size for the separately derived system. Where the equipment ground bus internal to the service equipment is not smaller than the required grounding electrode conductor, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

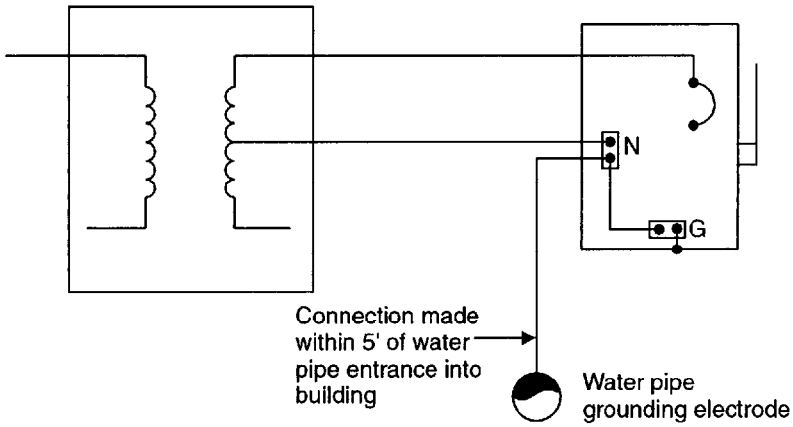
Wed Feb 02 02:31:11 2005

FPN: See Section 250-104(a)(4) for bonding requirements of interior metal water piping in the area served by separately derived systems.



Grounding and Bonding of Separately Derived System

Application

The grounding electrode for a separately derived system must be as near as practicable to the source of the system. The nearest of the first two choices listed in (a) or (b) should be selected. Where the grounded water pipe is nearest, it should be used. Where the grounded structural steel is nearest, it would be used. If grounded water pipe or building steel does not exist, any of the other electrodes listed in Sections 250-50 or 250-52 are used.

For a service supplied system, Section 250-50 requires the connection to the water pipe to be within 5 feet of the point where the water pipe enters the building. This same requirement now also applies to a separately derived system.

Bonding of interior metal piping systems may be required for some installations. The bonding requirements are found in Section 250-104(b).

Background and Explanation

This section was revised to clarify the selection of the electrode and where connections should be made. Water pipe electrodes for separately derived systems are now treated in the same manner as water pipe electrodes for grounding services relative to the connection point being within 5 feet of where the water piping enters the building or structure.

250-30(b) Ungrounded Separately Derived Systems

Type of Change New

BRIEF SUMMARY

Commercial and industrial. A new subsection provides requirements for ungrounded separately derived systems.

Code Language

250-30. Grounding Separately Derived Alternating-Current Systems.

•
•
•

(b) Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded as specified in (1) through (3).

(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with Section 250-66 for the derived phase conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in (2). This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means.

(2) Grounding Electrode. Except as permitted by Section 250-34 for portable and vehicle mounted generators, the grounding electrode shall comply with Section 250-30(a)(3).

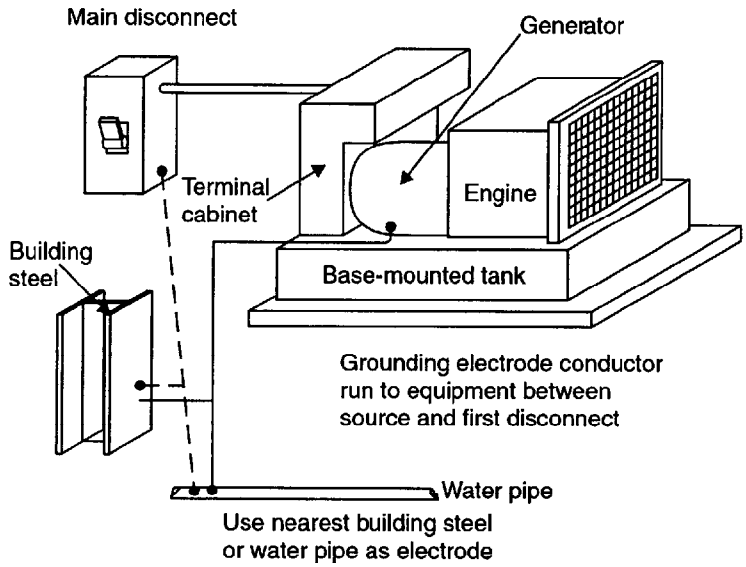
(3) Grounding Methods. In all other respects, grounding methods shall comply with requirements prescribed in other parts of this *Code*. (ROC 5-65) (ROC 5-82)

Application

The illustration shows a generator supplying an ungrounded separately derived system. This system might be a 480-volt delta system or any other system not required to be grounded by Sections 250-20 or 250-162. A grounding electrode conductor is required to connect a grounding electrode to the enclosures of the derived system. The connection to the enclosure may be made at any point from the source of the derived system to the first disconnecting means. The illustration shows the connection made to the generator frame. The dashed lines indicate another acceptable location for the connection. Electrodes are selected using the same criteria as for grounded systems, that is the nearest effectively grounded steel building member or water pipe, or other electrodes if building

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:12 2005

steel and water pipe are not available. No bonding jumper is used because there is no grounded system conductor. Connection to a water pipe electrode must be made within 5 feet of the metal water pipe entrance into a building. There is an exception that permits the connection to be made at any convenient point on the water piping system within commercial and industrial buildings, provided the piping used as an electrode is exposed for its entire length and the installation is serviced by qualified personnel.



Ungrounded Separately Derived Systems

Background and Explanation

This change expands and clarifies the rules on grounding where an ungrounded system is used. Prior editions of the code did not contain specific rules for grounding where an ungrounded separately derived system was installed. These new rules are now consistent with the grounding requirements for service-supplied ungrounded systems.

Although the system itself has no grounded conductor, the enclosures and other noncurrent-carrying metal parts must still be connected to a ground reference and to each other to provide adequate fault paths and reduce shock hazards.

Wed Feb 02 02:31:12 2005

250-32 (a) & (b) Multiple Building Grounding

Type of Change

Relocated and Revised

BRIEF SUMMARY

All occupancies. This section has been revised to reduce parallel neutral and equipment grounding paths.

Code Language

250-32. Two or More Buildings or Structures Supplied from a Common Service.

(a) Grounding Electrode. Where two or more buildings or structures are supplied from a common ac service **by a feeder(s) or branch circuit(s), the grounding electrode(s) required in Part C of this article at each building or structure shall be connected in the manner specified in (b) or (c). Where there are no existing grounding electrodes, the grounding electrode(s) required in Part C of this article shall be installed.** (TCC 5-82)

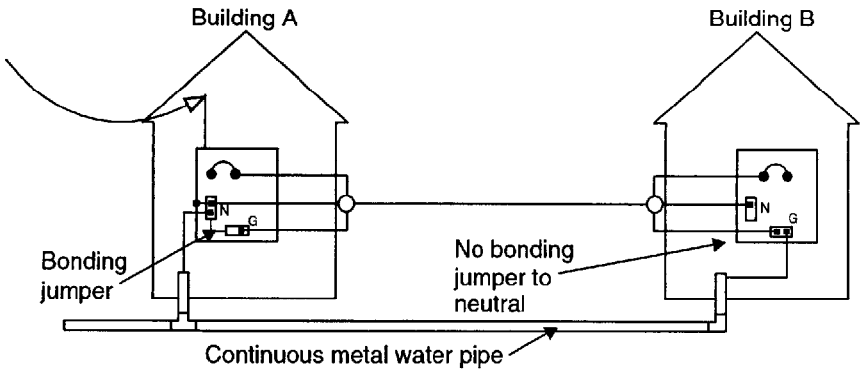
Exception: A grounding electrode at separate buildings or structures shall not be required where only one branch circuit ***supplies the*** *building or structure* ***and the branch circuit includes an equipment grounding conductor for grounding the noncurrent-carrying parts of all equipment.***

(b) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode and grounding or bonding of equipment, structures, or frames required to be grounded or bonded shall comply with either (1) or (2).

(1) Equipment Grounding Conductor. An equipment grounding conductor as described in Section 250-118 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).

(2) Grounded Conductor. Where (1) an equipment grounding conductor is not run with the supply to the building or structure, **and (2) there are no continuous metallic paths bonded to the grounding system in both buildings or structures involved, and (3) ground-fault protection of equipment has not been installed on the common ac service, the grounded circuit conductor run with the supply to the building or structure shall be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded.**

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:12 2005



Parallel Neutral Path Between Buildings

Application

As revised, Section 250-32(a) clarifies that either the equipment grounding conductor or the grounded (neutral) conductor (but not both) is required to be connected to a grounding electrode system at a separate building or structure. For grounded systems, Sections 250-32(b)(1) and (2) provide the grounding and bonding requirements for circuits run to a separate building or structure and have been revised to minimize the possibility of parallel ground return paths between buildings. Parallel paths may exist where equipment grounding conductors, metal piping systems, pipe racks, or other continuous metal paths are installed between buildings. In such cases, Sections 250-32(b)(1) and (2) prohibit a bonding connection between the grounded conductor and the equipment grounding conductor at a separate building or structure. In addition, where ground-fault protection of equipment is provided, bonding of the grounded and grounding conductors may result in improper operation of the ground-fault protection system due to the potential for parallel ground-fault current return paths.

Section 250-32(b)(1) requires the installation of at least one of the equipment grounding conductors described in Section 250-118. Where the equipment grounding conductor(s) is bonded to the grounding electrode system of the building or structure supplied, a grounding connection to the grounded conductor is not permitted.

Background and Explanation

This section was revised to eliminate parallel paths for neutral current that are created by multipoint neutral grounding at facilities having common mechanical, piping, or grounding systems or where the circuit conductors are installed in metallic raceways. This revision also assures the proper operation of ground-fault protection systems by providing a single path for fault current.

Where only a grounded (neutral) conductor is installed with the ungrounded conductors, it takes on the dual function of circuit conductor for line-to-neutral loads and as the ground-fault current return path. Therefore, it is necessary to size the conductor adequately for both functions. Section 220-22 provides the sizing rule for feeder neutral conductors based on the maximum unbalance that could occur in the circuit. Section 250-2(d) describes the performance objectives for the conductor that will provide the return path for ground-fault current. Table 250-122 provides the minimum size for equipment grounding conductors that will meet those performance objectives. The grounded conductor should be sized based on whichever section (220-22 or 250-2(d)) requires the largest conductor.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:13 2005

250-50 Number of Grounding Electrodes Required

Type of Change Revision

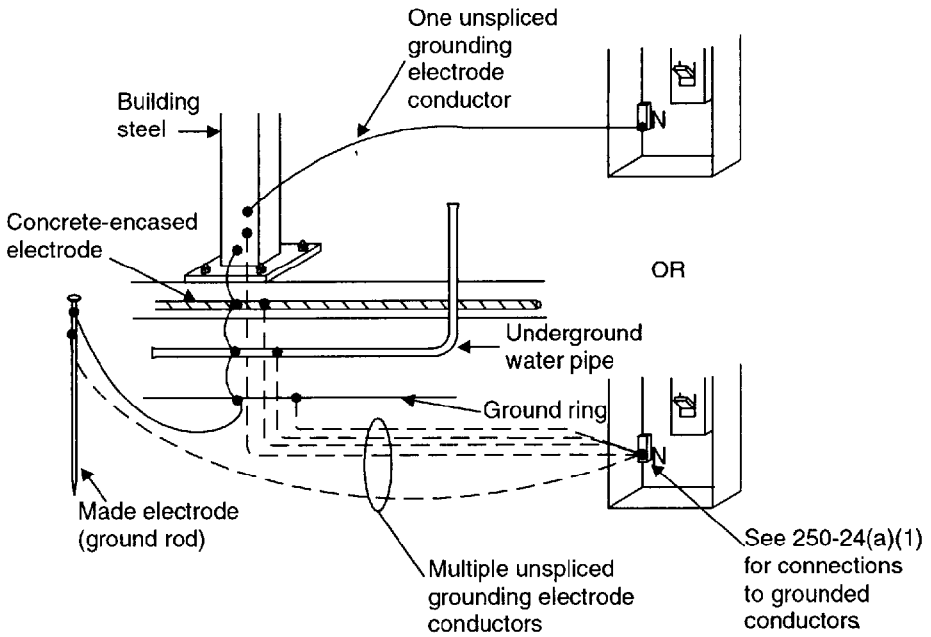
BRIEF SUMMARY

All installations. One or more grounding electrode conductors are permitted.

Code Language

250-50. Grounding Electrode System. If available on the premises at each building or structure served, each item (a) through (d), and any made electrodes in accordance with Sections 250-52(b), (c), and (d), shall be bonded together to form the grounding electrode system. The bonding jumper(s) shall be installed in accordance with Sections 250-64(a), (b), and (e) shall be sized in accordance with Section 250-66, and shall be connected in the manner specified in Section 250-70. (ROP 5-224a, 5-225) (ROC 5-100)

An unspliced grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system **or to one or more grounding electrode(s) individually.** It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it. (ROP 5-227)



Grounding Electrode Conductors

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:13 2005

Application

The illustration shows a collection of the grounding electrodes listed in Sections 250-50(a) through (d) and 250-52. The solid lines indicate a single unspliced grounding electrode conductor run to one of the electrodes, in this case the building steel. The other electrodes are bonded together to form the grounding electrode system. The single grounding electrode conductor must be full sized according to Section 250-66. The bonding conductors can be sized on the basis of the electrodes they connect to. For instance, the bonding conductor between the ground ring and the ground rod would not have to be larger than No. 6 copper.

The dashed lines in the illustration show an alternative way of running grounding electrode conductors and bonding the electrodes together. Separate grounding electrode conductors may be run to each electrode. In this case, the grounding electrodes are bonded together in the service equipment. The individual conductors may be sized on the basis of the phase conductors and the electrodes they connect to. For example, the conductors to the water pipe and the building steel would have to be sized from Table 250-66, but the conductors to the ground rod, ground ring, and concrete-encased electrode are permitted to be smaller in accordance with Section 250-66(a), (b), or (c).

The illustration shows two extremes: one grounding electrode conductor; or one grounding electrode conductor for each electrode. The electrodes could also be grouped. For example, one conductor could be run to the ground ring and ground rod and sized for the ground ring. Another conductor could be run to the building steel, water pipe, and concrete-encased electrode and sized for the water pipe or building steel.

Background and Explanation

This change is intended to be a clarification. No technical requirement was actually modified by this change. However, some authorities interpreted the previous language (this was in Section 250-81 in the 1996 NEC) to require a single grounding electrode conductor. Others interpreted the previous language to mean that only one grounding electrode conductor had to be unspliced and the others were really just bonding conductors. This change should help to make interpretations more uniform. With this change it should be clear that each grounding electrode conductor must be run unspliced to an electrode, and there can be more than one. Note that the main difference between the alternatives in the illustration is the location of the bonding point between electrodes at the service equipment or at each electrode.

250-104(a)(3) Sizing of Bonding Conductors

Type of Change New

BRIEF SUMMARY

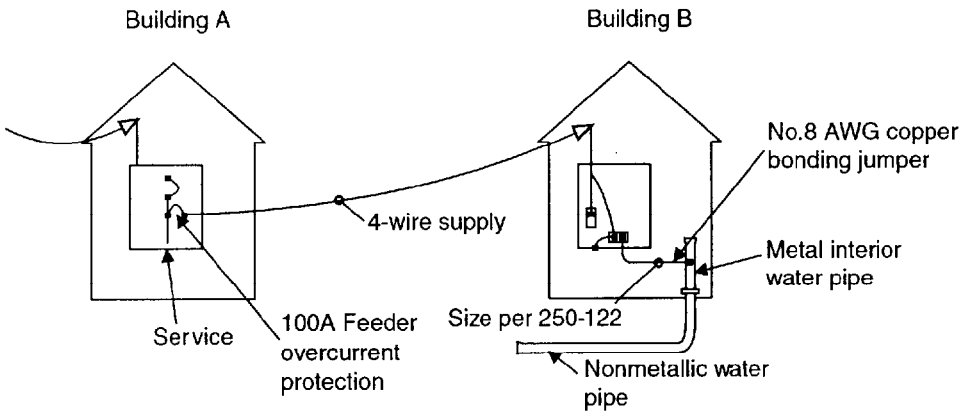
All occupancies. A new rule clarifies requirements for bonding of water piping systems in separate buildings.

Code Language

250-104. Bonding of Piping Systems and Exposed Structural Steel.

•
•
•

(3) Multiple Buildings or Structures Supplied from a Common Service. The interior metal water piping system shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, or to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Section 250-122 based on the rating or setting of the largest overcurrent device protecting the feeder(s) or branch circuit(s) that supply the building. (ROC 5-158)



Sizing Bonding Jumper at Separate Building

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:13 2005

Application

Section 250-32 (formerly Section 250-24) provides grounding requirements for separate buildings. Section 250-104(a)(3) requires that interior metal water piping systems be bonded.

Section 250-104(a) (formerly Section 250-80(a)) Exception requires the bonding jumper to be sized from Section 250-122 (formerly Section 250-95) based on the size of the overcurrent device in the circuit likely to energize the piping system.

Background and Explanation

The 1996 NEC required bonding of the metal structure and metallic piping systems in a multibuilding electrical distribution arrangement but the 1999 NEC now provides clear guidance for the sizing of this bonding conductor(s).

Wed Feb 02 02:31:14 2005

250-106 & FPNs Spacing from Lightning Protection Components

Type of Change Revision

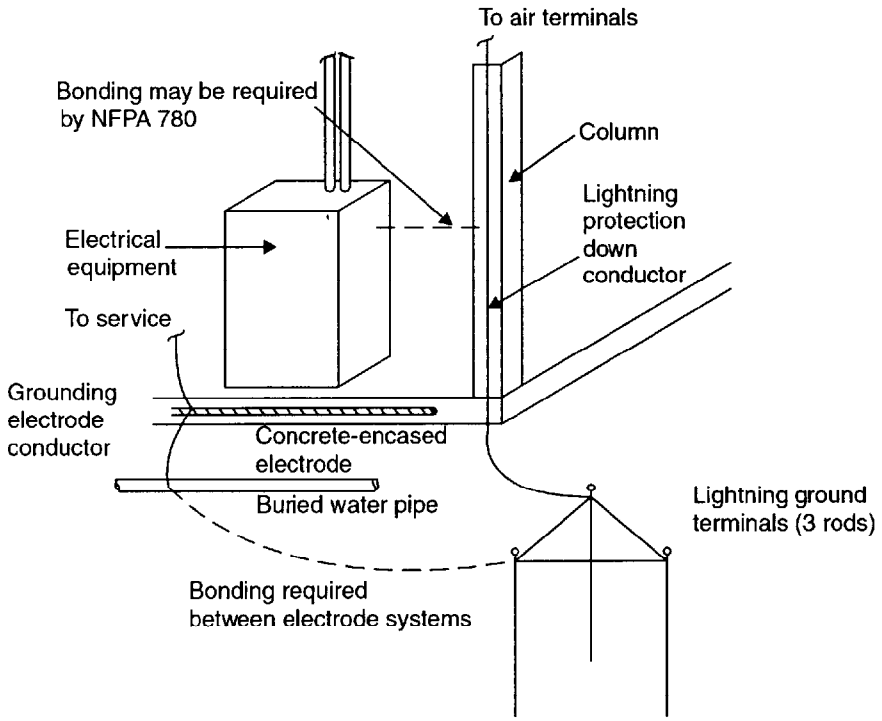
BRIEF SUMMARY

All installations. The ground terminals of a lightning protection system must be bonded to the grounding electrode system of the building or structure.

Code Language

250-106. Lightning Protection Systems. The lightning protection system ground terminals shall be bonded to the building or structure grounding electrode system.

FPN No. 1: See Section 250-60 for use of air terminals. For further information, see *Standard for the Installation of Lightning Protection Systems*, NFPA 780-1997, which contains detailed information on grounding, bonding, and spacing from lightning protection systems.



Lightning Protection Systems

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:14 2005

FPN No. 2: Metal raceways, enclosures, frames, and other noncurrent-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with *Standard for the Installation of Lightning Protection Systems*, NFPA 780-1997. Separation from lightning protection conductors is typically 6 ft (1.83 m) through air or 3 ft (0.92 m) through dense materials such as concrete, brick, or wood. (ROP 5-150a) (ROC 5-241)

Application

Where lightning protection systems are installed, the ground terminals of the lightning protection system must be bonded to the grounding electrode system of the building or structure.

The illustration shows a lightning protection down conductor connected to a ground terminal of a lightning protection system. Also shown are electrical equipment and raceways and grounding electrodes for the building. The ground terminal must be bonded to the grounding electrode system. However, according to Section 250-60, the ground terminal of the lightning protection system may not be used in place of the electrodes for the building.

The revised FPNs refer to NFPA 780 for other bonding requirements. In the illustration, some conductive parts of electrical equipment are in close proximity to the down conductor and must be bonded to the down conductor if determined necessary by calculations performed in accordance with NFPA 780. Types of equipment that must be bonded to down conductors and the spacings required to eliminate bonding are covered by NFPA 780.

Background and Explanation

This change was made to correct language and to state clearly the requirement to bond ground terminals to the grounding electrode system.

The previous wording in this section, formerly Section 250-46, required six-foot spacing or bonding between down conductors and electrical equipment or enclosures. This requirement was not entirely correct and did not completely address the bonding requirements of NFPA 780. In addition, the term "lightning rod," while commonly used and somewhat understood, is not correct terminology. Also, the previous wording did not state the very important requirement for bonding between electrodes and ground terminals.

Lightning protection systems consist of three basic elements: air terminals, ground terminals, and down conductors connecting the air terminals to the ground terminals. The objective is to provide safe and adequate pathways that lightning currents are likely to follow. By providing specific pathways, we can reduce the likelihood of damage due to lightning strikes finding their own pathways through building materials.

In the event of a lightning strike, the large currents in the down conductors cause strong, rapidly changing electromagnetic fields around the down conductors. These magnetic fields can induce voltages in other nearby metal bodies. Because of the extremely high voltages that produce them, lightning currents

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:14 2005

may also jump to other systems that provide alternate pathways to ground. To reduce the hazards, NFPA 780 provides a method to calculate whether it is necessary to provide additional bonding connections between the lightning protection system and metallic components of other systems. The distance depends on the materials surrounding the down conductors, as explained in FPN No. 2.

Technical corrections changing the term "lightning rods" to "air terminals" were also made to the language of Section 250-60 (formerly Section 250-86).

250-122(f) Use of GFPE with Multiconductor Cables in Parallel

Type of Change New

BRIEF SUMMARY

Industrial. The new subsection provides an alternative method for selecting the size of equipment grounding conductors in multiconductor cables that are installed in parallel.

Code Language

250-122. Size of Equipment Grounding Conductors.

•
•
•

(f) Conductors in Parallel. Where conductors are run in parallel in multiple raceways or cables as permitted in Section 310-4, the equipment grounding conductors, where used, shall be run in parallel in each raceway or cable. **One of the following methods shall be used to ensure the equipment grounding conductors are protected.**

(1) Each parallel equipment grounding conductor shall be sized on the basis of the ampere rating of the overcurrent device protecting the circuit conductors in the raceway or cable in accordance with Table 250-122.

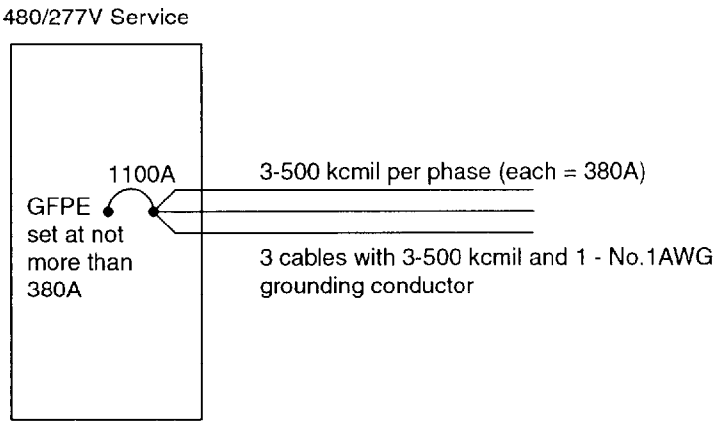
(2) Where ground-fault protection of equipment is installed, each parallel equipment grounding conductor in a multiconductor cable shall be permitted to be sized in accordance with Table 250-122 on the basis of the trip rating of the ground-fault protection where the following conditions are met.

(1) Conditions of maintenance and supervision ensure that only qualified persons will service the installation.

(2) The ground-fault protection equipment is set to trip at not more than the ampacity of a single ungrounded conductor of one of the cables in parallel.

(3) The ground-fault protection is listed for the purpose.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:15 2005



GFPE for Multiconductor Cables in Parallel

Application

In most installations, the equipment grounding conductor for parallel circuits must be based on the rating of the circuit. This requires each parallel raceway or cable to contain a full-sized grounding conductor based on Section 250-122. If a fault occurs in a raceway or cable, the equipment grounding conductor must be capable of carrying enough current to clear the fault.

New Section 250-122(f)(2) allows an alternate method where ground-fault protection for equipment is provided. In this case the setting of the ground-fault protection is to be not more than the ampacity of a single ungrounded conductor. The equipment grounding conductors are permitted to be sized in accordance with Table 250-122 based on the GFPE setting instead of the continuous current rating of the overcurrent device.

Background and Explanation

This allows the use of cables of standard construction and reduces the need for special-order cables, particularly where cables are used for large-capacity parallel circuits. This change will have use where cables are used for parallel circuits installed in cable trays. The use of the GFPE will provide safe levels of ground-fault protection for this type of installation.

300-1(a) Excs. Relocation/Deletion of Exceptions

Type of Change Deleted or Relocated

BRIEF SUMMARY

All occupancies. Exceptions have been deleted or relocated from Article 300.

Section 300-1

1996 NEC	*1999 NEC*
Exception No. 1	Deleted
Exception No. 2	725-3
Exception No. 3	760-3
Exception No. 4	770-3
Exception No. 5	Deleted
Exception No. 6	Deleted
Exception No. 7	Deleted

Background and Explanation

Section 300-1 contained a series of exceptions indicating that Article 300 does not apply to some installations in Chapters 5, 7, and 8. Section 90-3 indicates that Chapters 5, 6, and 7 modify the general rule in Chapters 1 through 4. Chapter 8 is independent of the other chapters.

Since Section 90-3 allows these other chapters to modify Chapter 3, the exceptions were unnecessary. As shown above, some were deleted, others were relocated.

300-4(b)(1) Full-Opening Protection with Grommets and Bushings

Type of Change Revision

BRIEF SUMMARY

All installations. Bushings or grommets must cover all metal edges where NM cable is installed through holes in metal framing.

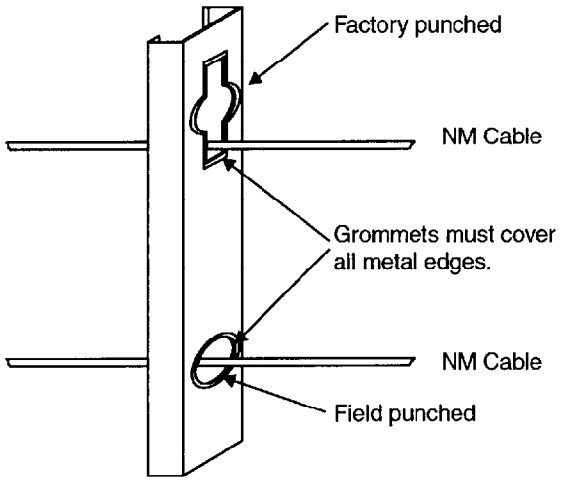
Code Language

300-4. Protection Against Physical Damage.

•
•
•

(b)Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.

(1)Nonmetallic-Sheathed Cable. In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets **covering all metal edges and** securely fastened in the opening prior to installation of the cable. (ROP 3-31)



NM Cable in Metal Framing

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:16 2005

Application

Grommets that are available in U or V shapes and cover only the lower edges of a hole through metal framing are no longer permitted. Grommets must cover all metal edges of holes through which NM cable is installed.

Background and Explanation

Type NM cables are subject to damage during installation as they are pulled through holes in metal framing. The substantiation for this change cited a specific case where a construction worker was shocked by energized metal framing. The framing was energized because the outer sheath and conductor insulation were damaged by the sharp edges of metal framing as the cable was pulled through the holes. The holes were equipped with grommets that covered only the bottom edges, and the cables were damaged by the uncovered edges.

Wed Feb 02 02:31:16 2005

300-5(d) Marking Tape for Underground Installation

Type of Change Revision

BRIEF SUMMARY

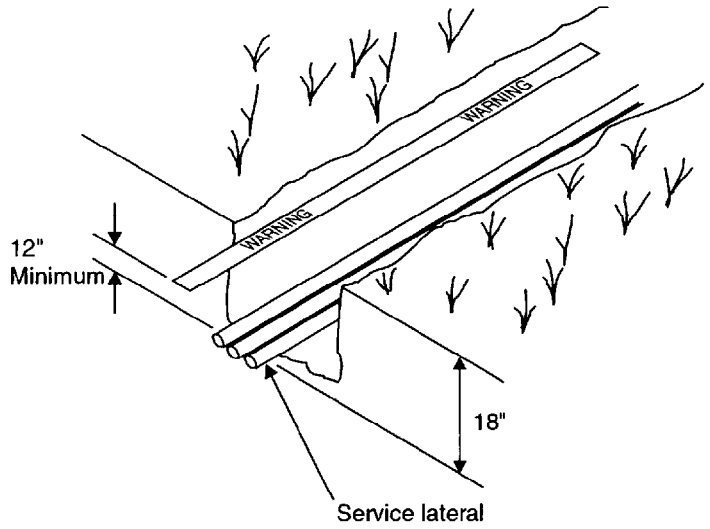
All occupancies. This change requires a warning ribbon above underground service laterals.

Code Language

300-5. Underground Installations.

(d) Protection from Damage. Direct-buried conductors and cables emerging from the ground shall be protected by enclosures or raceways extending from the minimum cover distance required by Section 300-5(a) below grade to a point at least 8 ft (2.44 m) above finished grade. In no case shall the protection be required to exceed 18 in. (457 mm) below finished grade.

Service laterals that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. (305 mm) above the underground installation. (ROC 3-3)



Warning Ribbon for Service Laterals

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:16 2005

Application

Where underground service laterals are not encased in concrete, their location must be marked by a warning tape or ribbon. The marking ribbon should be placed in the trench after at least 12 inches of backfill is in place.

Background and Explanation

The intent is to reduce the shock hazards present when excavation is done near underground service conductors. The warning tape or ribbon is often required by utility company specifications for underground service lateral conductors, but up until now was not required by the NEC.

Wed Feb 02 02:31:17 2005

300-11(a) Support Wires for Wiring Methods

Type of Change Revision

BRIEF SUMMARY

All installations. Separate support wires may be used as support for wiring methods if they provide secure support. Where used in fire-rated floor-ceiling or roof-ceiling assemblies, the independent support wires must be color-coded or tagged.

Code Language

300-11. Securing and Supporting.

(a) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place. Support wires that do not provide secure support shall not be permitted as the sole support. **Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires, shall be permitted as the sole support. Where independent support wires are used, they shall be secured at both ends.** Cables and raceways shall not be supported by ceiling grids. (ROP 3-64) (ROC 3-55)

(1) Wiring located **within the cavity** of a fire-rated floor-ceiling or roof-ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided. **Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means from those that are part of the fire-rated design.** (ROP 3-64) (ROC 3-55)

Exception: The ceiling support system shall be permitted to support wiring and equipment that have been tested as part of the fire-rated assembly.

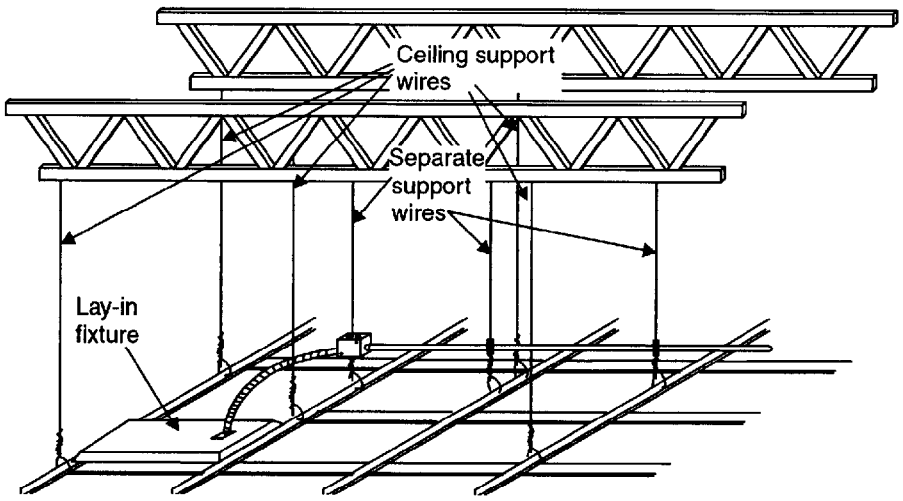
FPN: One method of determining fire rating is testing in accordance with *Standard Methods of Tests of Fire Endurance of Building Construction and Materials*, NFPA 251-1995.

(2) Wiring located **within the cavity** of a nonfire-rated floor-ceiling or roof-ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided. (ROP 3-64)

Exception: The ceiling support system shall be permitted to support branch-circuit wiring and associated equipment where installed in accordance with the ceiling system manufacturer's instructions.

(ROC 3-55)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:17 2005



Separate Support Wires for Wiring Methods

Application

Ceiling support wires and ceiling assemblies may not be used for support of electrical wiring methods unless tested for that use. Separate support wires may be installed, but they must be fastened at both ends as shown in the illustration, and they must provide secure support. Separate support wires used with fire-rated floor-ceiling or roof-ceiling assemblies must be tagged or color-coded to distinguish them from the ceiling support wires.

Background and Explanation

This section has been modified during each of the last five code cycles. For at least 20 years prior to the 1987 code, this part of Section 300-11 simply said "Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place...." In the 1987 code the following sentence was added: "Support wires that do not provide rigid support shall not be permitted as the sole support." In 1990 the word "rigid" was changed to "secure," and another sentence was added: "Equipment that is located within, supported by, or located below a suspended ceiling shall be permitted to be supplied or controlled by branch-circuit wiring that is supported by the suspended ceiling support wires." This was further modified in 1993 by replacing the third sentence with two new paragraphs: "Branch-circuit wiring associated with equipment that is located within, supported by, or secured to a fire-rated floor or roof-ceiling assembly shall not be secured to the ceiling support wires.

"Branch-circuit wiring associated with equipment that is located within, supported by, or secured to a nonfire-rated floor or roof-ceiling assembly shall be permitted to be supported by the ceiling support wires."

The 1996 NEC reworded the 1993 paragraphs and prohibited wiring to be "secured to, or supported by, the ceiling assembly" whether the floor-ceiling or

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:17 2005

roof-ceiling assembly was fire-rated or not. An additional sentence said "Cables and raceways shall not be permitted to be supported by ceiling grids." This requirement eliminated the possibility of using the grid itself as support for any wiring methods, even though the ceiling was still allowed to support boxes and fixtures, and some fixtures were still required to be secured to the ceiling grid in accordance with Section 410-16(c).

The 1996 requirement made installations in ceilings that were suspended more than a few feet more difficult, as a separate support system had to be constructed for raceway or cable systems in these cavities. It also rendered some wiring methods, such as manufactured wiring systems, impractical in some of the applications where they had previously been installed.

The language in the 1999 NEC is a step back toward previous practice, but new wording is provided to assure that the ceiling assemblies do not have to carry the weight of the wiring methods. The fact that ceiling systems are not tested for the unknown weight of the wiring methods that might be attached to the support wires was the primary substantiation behind the 1996 and 1999 changes.

300-11(b) Use of Raceways to Support Wiring Methods

Type of Change Revision

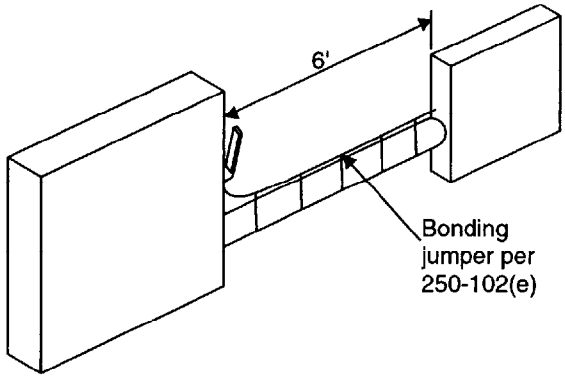
BRIEF SUMMARY

All occupancies. This revision restricts the use of raceways to support other items.

Code Language

300-11. Securing and Supporting.
(b) Raceways Used as Means of Support. Raceways shall ~~not~~ **only** be used as a means of support for other raceways, cables, or nonelectric equipment **under the following conditions:** (ROP 3-82) (ROC 3-59) (TCC 3-59)

(1) Where the raceway or means of support is identified for the purpose; or
(2) Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits; or
(3) Where the raceway is used to support boxes or conduit bodies in accordance with Section 370-23 or to support fixtures in accordance with Section 410-16(f). (ROC 3-54)



Bonding Jumper Attached to Raceway

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:18 2005

Background and Explanation

The changes to this section are another example of exceptions being converted to positive code text. In addition, the code panel actions on proposals and comments to this section indicate that the common industry practice of installing a bonding jumper on the exterior of a raceway in accordance with Section 250-102(e) and attaching it to that raceway is permitted. To keep the bonding conductor in close proximity to the circuit conductors and to prevent physical damage to the conductor, securing it to the raceway is often necessary.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:18 2005

300-14 Length of Free Conductor

Type of Change Revision

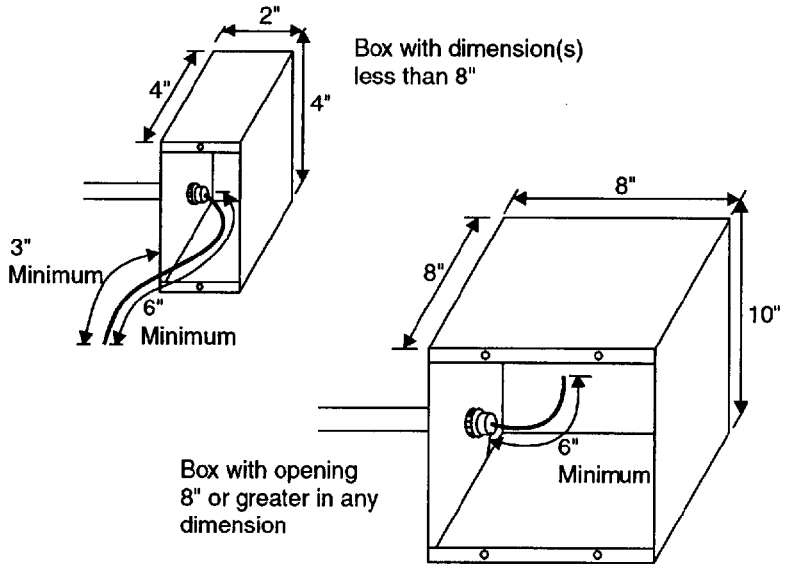
BRIEF SUMMARY

All installations. This section has been revised to clarify how to determine free conductor length and to address the length that extends beyond the enclosure opening.

Code Language

300-14. Length of Free Conductors at Outlets, Junctions, and Switch Points. At least 6 in. (152 mm) of free conductor, **measured from the point in the box where it emerges from its raceway or cable sheath**, shall be left at each outlet, junction, and switch point for splices or the connection of fixtures or devices. **Where the opening to an outlet, junction, or switch point is less than 8 in. (203 mm) in any dimension, each conductor shall be long enough to extend at least 3 in. (76.2 mm) outside the opening.** (ROP 3-103)

Exception: Conductors that are not spliced or terminated at the outlet, junction, or switch point.



Length of Free Conductor

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:18 2005

Application

The illustration shows the two basic conditions for this rule. The box with an opening less than 8 inches in height or width must have at least 6 inches of free conductor measured from where it emerges from the conduit and at least 3 inches of free conductor extending outside the opening. The larger box, where a dimension of the opening is at least 8 inches, is only required to have 6 inches of free conductor measured from where it emerges from the conduit. While these examples show conductors in conduits, the same rules apply for cables, except that the measurement is taken from the point where the conductor emerges from the cable fitting or sheath inside the box or enclosure.

Background and Explanation

The "6-inch free conductor rule" has long been subject to varying interpretations. A number of sometimes conflicting proposals and comments to clarify the requirement were proposed for the 1996 code. A task group was formed to resolve the language, and the result is the revised wording of Section 300-14. This wording clarifies how the measurement should be made. In addition, where box openings are relatively small, three inches of conductor must extend from the box opening for splices or the connection of devices.

STD·NFPA NEC CHANGES-ENGL 1999 ■ 6474446 0577035 42T ■

300-18(b) Prohibition on Welding Metal Conduits

Type of Change New

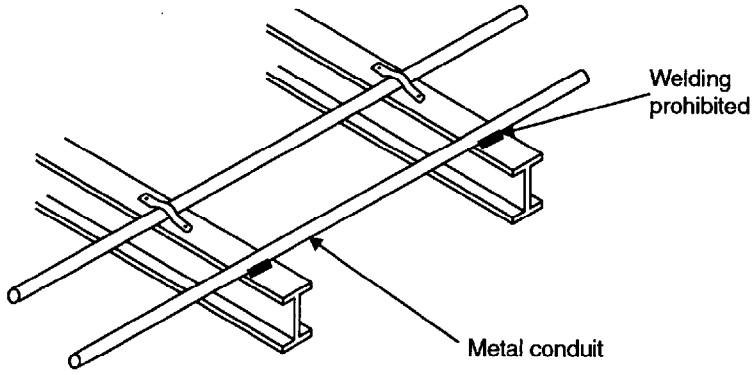
BRIEF SUMMARY

All occupancies. Welding of conduit is prohibited.

Code Language

300-18. Raceway Installations.

(b) Welding. Metal raceways shall not be supported, terminated, or connected by welding to the raceway unless specifically designed to be or otherwise specifically permitted to be in this *Code*. (ROP 3-119) (ROC 3-88, 3-92)



Securing Raceways by Welding Not Permitted

Application

Inspectors have reported cases where welding was used to secure metal conduit and EMT. This section now clearly prohibits this practice.

Background and Explanation

Welding is not a recognized method for the support of conduit and may compromise the integrity of external and internal finishes as well as possibly cause distortion to the interior of the raceway. There was no specific language in the NEC to prohibit this method of support for metal raceways.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:19 2005

NEC pp. 113–115

Article 300
Part B Relocated Requirements from Article 710

Type of Change Relocation

BRIEF SUMMARY

Commercial and industrial. Existing Article 300, Part B (including Sections 300-31 through 300-37) has been expanded with the rules for wiring methods from the deleted Article 710.

Code Language

Part B. Requirements for Over 600 Volts, Nominal
300-31. Covers Required.
300-32. Conductors of Different Systems.
300-34. Conductor Bending Radius.
300-35. Protection Against Induction Heating.
300-37. Aboveground Wiring Methods.
300-39. Braid-Covered Insulated Conductors—Open Installation.
300-40. Insulation Shielding.
300-42. Moisture or Mechanical Protection for Metal-Sheathed Cables.
300-50. Underground Installations.

Application

The illustration shows the origin and new location of the relocated and rearranged sections.

Background and Explanation

This change was part of the redistribution of Article 710 and the consolidation of requirements for over 600 volts. The previous Sections 300-31 through 300-35 were retained. Section 300-36 on grounding was deleted because it was an unneeded general reference to Article 250. The sections of Article 710 that were applicable to wiring methods were relocated as shown in the diagram.

300-37 EMT Permitted for Use Over 600 Volts

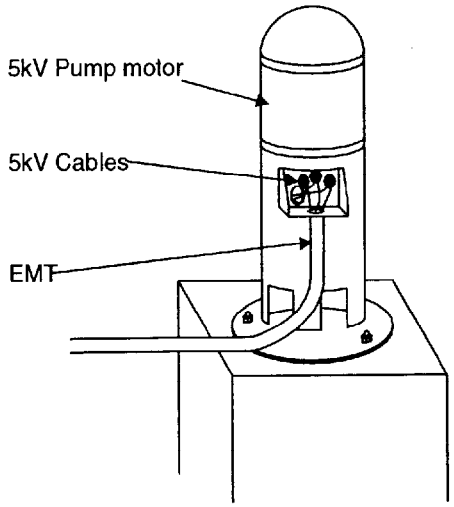
Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Electrical metallic tubing is now included as a suitable wiring method for over 600 volts in aboveground locations.

Code Language

300-37. Aboveground Wiring Methods. Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, **in electrical metallic tubing,** in rigid nonmetallic conduit, in cable trays, as busways, as cablebus, in other identified raceways, or as open runs of metal-clad cable suitable for the use and purpose. In locations accessible to qualified persons only, open runs of Type MV cables, bare conductors, and bare busbars shall also be permitted. Busbars shall be permitted to be either copper or aluminum. (ROP 13-35, 13-37, 13-38, 3-148)



EMT for Over 600 Volts

Application

Electrical metallic tubing may be used as a wiring method for over 600 volts in aboveground locations. The illustration shows an example of a possible application for EMT in an over-600-volt application.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:20 2005

Background and Explanation

Section 300-37 in the 1996 NEC was titled "Underground Installations." It provided only a reference to Section 710-4(b). Article 710 has been deleted from the 1999 code and the provisions of Section 710-4 have been moved to Sections 300-37 and 300-50. Section 300-37 now covers wiring methods for over 600 volts for aboveground installations. EMT was added as an acceptable wiring method; some testing laboratories now list EMT as suitable for over 600-volt installations.

305-4(b) & (c) NM and NMC Cable for Temporary Wiring

Type of Change Revision

BRIEF SUMMARY

All installations. Type NM and NMC cables may be used for temporary feeder and branch-circuit wiring without height restrictions.

Code Language

305-4. General.

(a) Services. Services shall be installed in conformance with Article 230.

(b) Feeders. Feeders shall be protected as provided in Article 240. They shall originate in an approved distribution center. Conductors shall be permitted within cable assemblies, or within cords or cables of a type identified in Table 400-4 for hard usage or extra-hard usage. **For the purpose of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation.** (ROC 3-137)

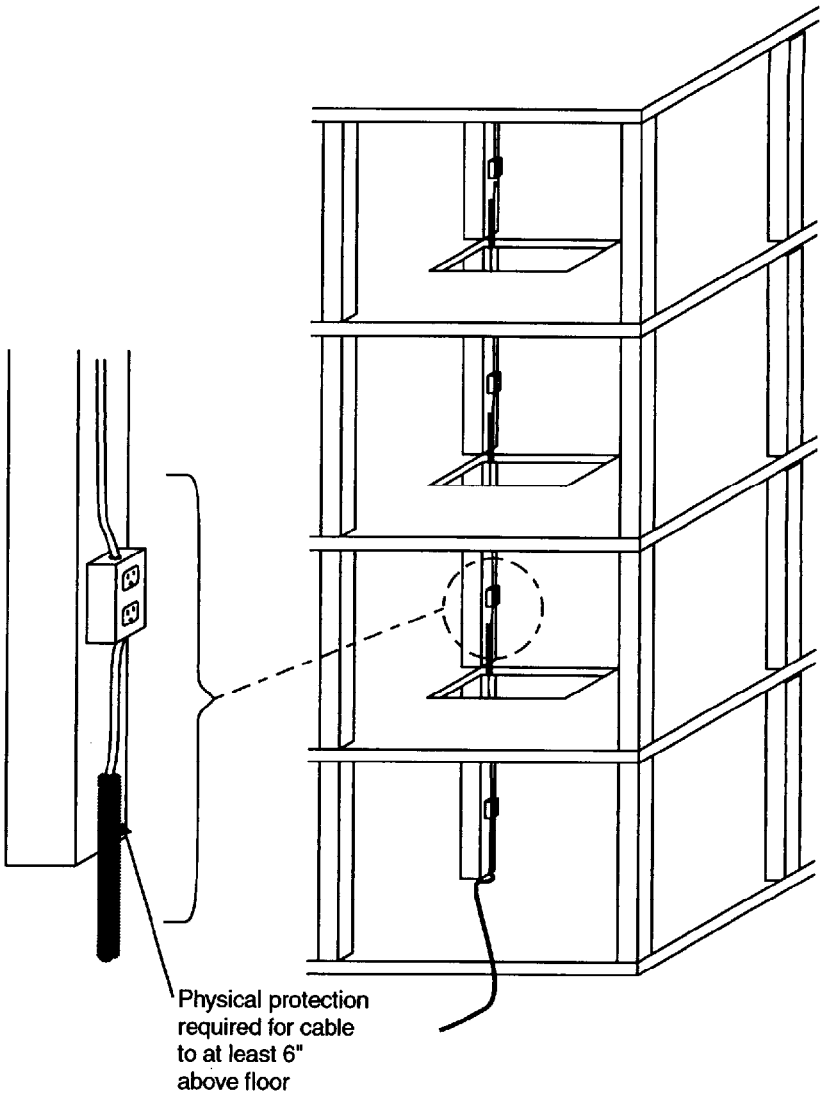
Exception: Single insulated conductors shall be permitted where installed for the purpose(s) specified in Section 305-3(c), where accessible only to qualified persons. (ROP 3-157)

(c) Branch Circuits. All branch circuits shall originate in an approved power outlet or panelboard. Conductors shall be permitted within cable assemblies, or within multiconductor cord or cable of a type identified in Table 400-4 for hard usage or extra-hard usage. All conductors shall be protected as provided in Article 240. **For the purposes of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation.** (ROP 3-161) (ROC 3-138)

Application

As shown in the illustration, NM and NMC cables may be used as feeders or branch circuits for temporary wiring even in structures over three stories high. The cables must be suitable for the conditions and be adequately supported and protected from damage.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:20 2005



NM and NMC Cable for Temporary Wiring

Background and Explanation

NM or NMC cables are restricted by occupancy in some cases, and restricted by height limitations in some buildings. (See the revisions to Section 336-4.) However, as stated in Section 305-1, temporary wiring methods "... may be of a class less than would be required for permanent installations." This change makes explicit mention of the suitability of NM and NMC cables as temporary wiring methods. It also settles the issue of whether the height restrictions of Article 336 apply to temporary wiring installations. However, the cables should be suitable for the conditions, and NM and NMC cables are not suitable for use in wet locations according to Section 336-4. In addition, Section 336-6(b) requires physical protection for cables subject to physical damage. Otherwise, both NM and NMC are suitable for exposed work, even when permanently installed. NM cable has been successfully used as a temporary wiring method, and this fact is now recognized in Article 305.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:20 2005

305-4(j) Support Requirements for Temporary Wiring Methods

Type of Change New

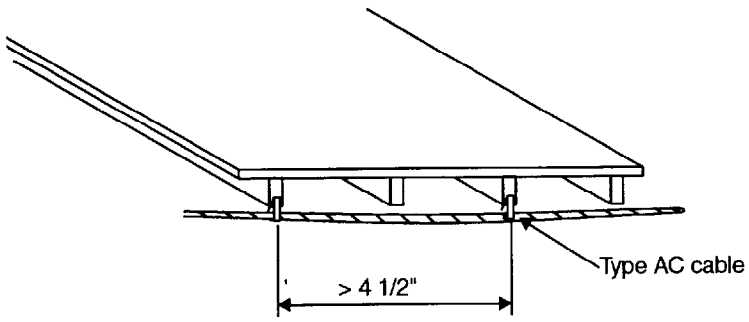
BRIEF SUMMARY

All installations. Adequate support of cables used for temporary wiring is required.

Code Language

305-4. General.

(j) Support. Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. (ROP 3-167) (ROC 3-148)



Adequate Support Intervals for Temporary Wiring

Application

Cables used for temporary wiring must be protected from physical damage. To ensure proper protection, cables and cords must be adequately supported. Distance between supports is not specified and is therefore dependent on the specific jobsite conditions. Installers should check with the authority having jurisdiction for approval of the support intervals. Staples, straps, and cable ties are among the recognized methods.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:21 2005

Background and Explanation

The submitter of the proposal indicated that the requirements for the support of cables for permanent installations (from the respective Chapter 3 articles) were in most cases overly restrictive for temporary wiring applications. However, it is necessary to provide some support in order to reduce the number of cases where cables are damaged on temporary wiring sites. This new rule allows for a practical approach to cable and cord management depending on the type of cable or cord, and its location, and the specific conditions that will be encountered at the installation site.

305-6(a) & (b) 30-Ampere, 125-Volt GFCI Protection

Type of Change Revision

BRIEF SUMMARY

All installations. 30-ampere, 125-volt receptacles used for temporary wiring must have GFCI protection.

Code Language

305-6. Ground-Fault Protection for Personnel. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with (a) and (b). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.

(a) Receptacle Outlets. All 125-volt, single-phase, 15-, 20-, and **30-ampere** receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit interrupter protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit interrupter protection for personnel shall be provided. For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit interrupter protection for personnel **identified for portable** use shall be permitted. (ROC 3-153)

Exception No. 1: Receptacles on a 2-wire, single-phase portable or vehicle-mounted generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from the generator frame and all other grounded surfaces, shall be permitted without ground-fault protection for personnel.

Exception No. 2: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in Section 305-6(b)(2) shall be permitted to be utilized ***for all receptacle outlets.***

(b) Use of Other Outlets. **Receptacles other than 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles shall have protection in accordance with (1) or the assured equipment grounding conductor program in accordance with (2).** (ROC 3-153)

(1) Ground-fault circuit interrupter protection for personnel.

(2) A written assured equipment grounding conductor program continuously enforced at the site by one or more designated persons to ensure that equipment grounding conductors for all cord sets, receptacles that are

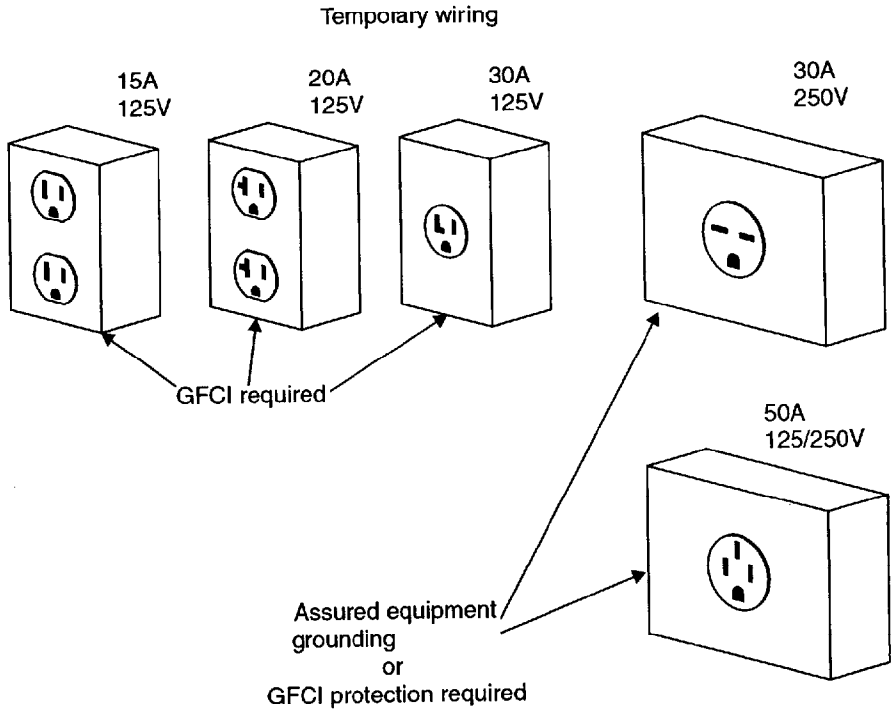
Copyright by the National Fire Protection Association
Wed Feb 02 02:31:21 2005

not a part of the permanent wiring of the building or structure, and equipment connected by cord and plug are installed and maintained in accordance with the applicable requirements of Sections 210-7(c), 250-114, 250-138, and 305-4(d).

(a) The following tests shall be performed on all cord sets, receptacles that are not part of the permanent wiring of the building or structure, and cord- and plug-connected equipment required to be grounded.

(1) All equipment grounding conductors shall be tested for continuity and shall be electrically continuous.
(2) Each receptacle and attachment plug shall be tested for correct attachment of the equipment grounding conductor. The equipment grounding conductor shall be connected to its proper terminal.
(3) All required tests shall be performed
  (a) Before first use on ~~construction~~ site (ROC 3-153)
  (b) When there is evidence of damage
  (c) Before equipment is returned to service following any repairs
  (d) At intervals not exceeding 3 months

(b) The tests required in (2)(a) shall be recorded and made available to the authority having jurisdiction. (ROP 3-175)



Receptacles Used for Temporary Power

Application

As shown in the illustration, 125-volt, 15-, 20-, and 30-ampere rated receptacles used for temporary wiring must have GFCI protection. The GFCI protection may be provided by a portable device. Other receptacles used for temporary wiring may be GFCI protected or they shall comply with the requirements of an assured equipment grounding program. Other types of outlets, such as a permanent

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:21 2005

connection to a lift or a welder on a construction site or lighting outlets not wired through receptacles, are not required to be covered by the GFCI or assured equipment grounding requirements.

Background and Explanation

This change involves four wording changes. In the first sentence of Section 305-6 the phrase "shall be provided to comply with (a) or (b) below" was changed to "...(a) and (b) below." Some people were interpreting the "or" to mean that 15- and 20-ampere 125-volt receptacles could still be covered by an assured equipment grounding program. This change was a clarification, with no change in intent.

Another clarification was made by rewording Section 305-6(b) and changing its title to "Use of Other Outlets."

The other two changes modified the technical requirements of the section. These changes were the addition of 30-ampere receptacles in subsection (a) and the addition of the phrases "or devices" and "identified for portable use" in the last sentence of Section 305-6(a) before the exceptions. The first of these changes removed 30-ampere, 125-volt receptacles from the assured equipment grounding option and required GFCI protection for these outlets. The second allows for the use of portable cords or devices provided with GFCI protection. This change also clarifies that industrial facilities are permitted to use the "assured equipment grounding conductor program" for all receptacles, including 15-, 20-, and 30-ampere, single-phase, 125-volt configurations. Section 305-6(b) requires receptacles other than 15,20, and 30 ampere, 125 volt, single phase to be protected by either ground-fault circuit interrupters or the assured equipment-grounding conductor program.

Wed Feb 02 02:31:22 2005

310-4 Parallel Conductor Requirements

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The requirement for the installation for parallel conductors has been clarified.

Code Language

310-4. Conductors in Parallel. Aluminum, copper-clad aluminum, or copper conductors of size No. 1/0 and larger, comprising each phase, neutral, or grounded circuit conductor, shall be permitted to be connected in parallel (electrically joined at both ends to form a single conductor).

Exception No. 1: As permitted in Section 620-12(a)(1).

Exception No. 2: Conductors in sizes smaller than No. 1/0 shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices provided

(a) They are contained within the same raceway or cable

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors and

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 3: Conductors in sizes smaller than No. 1/0 shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 2 are met.

Exception No. 4: Under engineering supervision, grounded neutral conductors in sizes No. 2 and larger shall be permitted to be run in parallel for existing installations.

FPN: Exception No. 4 can be utilized to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

The paralleled conductors in each phase, neutral, or grounded circuit conductor shall:

(1) Be the same length
(2) Have the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:22 2005

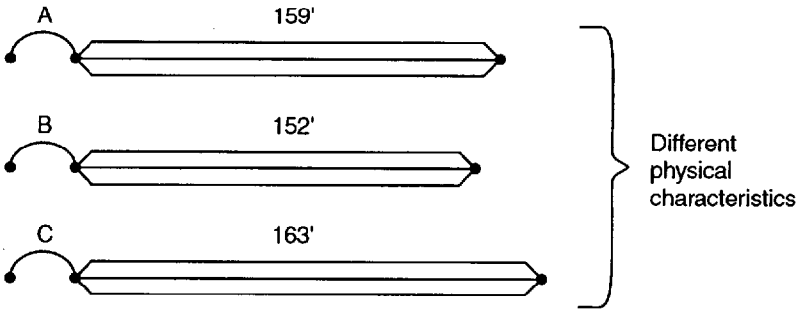
Where run in separate raceways or cables, the raceways or cables shall have the same physical characteristics. **Conductors of one phase, neutral, or grounded circuit conductor shall not be required to have the same physical characteristics as those of another phase, neutral, or grounded circuit conductor to achieve balance.**

FPN: Differences in inductive reactance and unequal division of current can be minimized by choice of materials, methods of construction, and orientation of conductors. (ROP 6-8)

Where equipment grounding conductors are used with conductors in parallel, they shall comply with the requirements of this section except that they shall be sized in accordance with Section 250-122.

Where conductors are used in parallel, space in enclosures shall be given consideration (see Articles 370 and 373).

Conductors installed in parallel shall comply with the provisions of Section 310-15(b)(2)(a).



Rules for Parallel Conductors Apply Individually to Each Phase Group.

Application

Where conductors are installed in parallel, the conductors in each phase must be the same as shown in Section 310-4(1) through (5). It is not necessary for one phase to be the same as another phase. Conductors in each phase must be the same to assure equal division of current within that phase. Load sharing will not occur between the conductors of the different phases. This only becomes a problem within each phase. For example, one phase could be copper and another could be aluminum.

Background and Explanation

This material was changed from a FPN to code text to clarify the rule. The change also makes the provision mandatory code text rather than informational only. It is not intended that all of the ungrounded, grounded, and neutral conductors have the same characteristics, only those conductors in parallel that comprise the same phase, grounded conductor, or neutral. Requiring all of the parallel conductors for all of the phases, grounded conductor, and neutral to be the same length, for example, is unnecessary and can lead to installation problems within enclosures due to excessive amounts of conductor.

Wed Feb 02 02:31:23 2005

Application

The table shows the old and new locations of the notes to Tables 310-16 through 310-19 and the reorganization of Section 310-15. This change did not change any technical requirements from the 1996 NEC.

Background and Explanation

This change was made to improve the usability of Section 310-15 and the Allowable Ampacity Tables and to place the note on small-conductor overcurrent protection limitation into Section 240-3, which is the basic conductor protection requirement.

318-2 Securing Cables in Cable Trays

Type of Change Revision

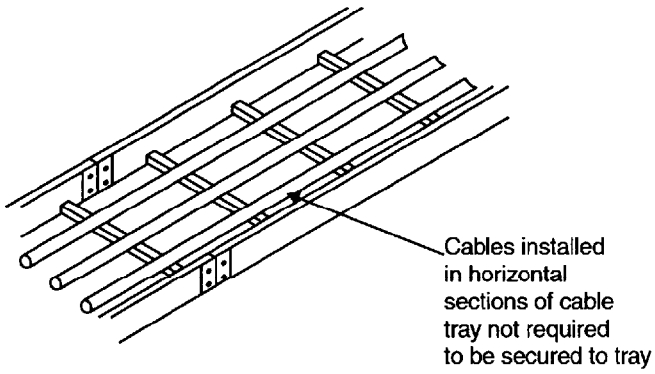
BRIEF SUMMARY

Commercial and industrial. The definition of cable tray systems has been clarified relative to cable supporting and securing.

Code Language

318-2. Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a ~~rigid~~ structural system used to **securely fasten or** support cables and raceways. (ROP 8-8, 8-10)



A Cable Support System

Application

Cable tray systems may be used to support various types of cables and raceways. The tray system provides the support required by the articles covering the wiring methods used. Article 318 does not require that wiring methods such as cables be securely fastened to the cable tray. In some installations the designer may specify that cables be fastened to the tray with cable ties or other methods. This technique will limit cable movement under fault conditions.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:23 2005

Background and Explanation

The panel statement for this change indicates the intent is that cables and raceways may be, but are not required to be, securely fastened.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:23 2005

318-6(j) Outlet Boxes Supported by Cable Trays

Type of Change Revision

BRIEF SUMMARY

Industrial. Outlet boxes have been added to the items that may be supported from cable trays.

Code Language

318-6. Installation.

•
•
•

(j) Raceways, Cables, and Outlet Boxes Supported from Cable Trays. In industrial facilities where conditions of maintenance and supervision ensure only qualified persons will service the installation and where cable trays are designed to support the load, raceways, cables, **and outlet boxes** shall be permitted to be supported from cable trays. For raceway terminating at the tray, a listed cable tray clamp or adapter shall be used and no nearby support, such as a support within 3 ft (914 mm), shall be required.

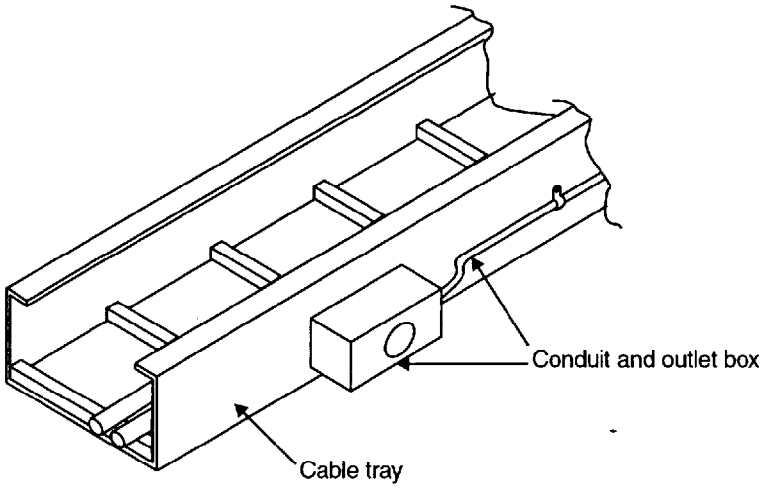
For raceway or cable running parallel to, but under or beside, a tray, support shall be in accordance with the requirements of the appropriate raceway or cable article.

For outlet boxes located under or beside a tray, support shall be in accordance with the requirements of Article 370. (ROP 8-29, 8-30)

Application

As shown in the illustration, outlet boxes may be supported from cable trays in industrial installations. Boxes mounted under or beside the tray, as in the illustration, must also meet the requirements of Article 370. Specifically, Section 370-23(a) requires the box to be rigidly and securely fastened. The cable tray must be designed to support the load, and servicing of the installation must be by qualified persons only. Raceways and cable may also be supported by cable trays. The illustration shows a receptacle outlet, but other types of outlets may be installed.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:24 2005



Outlet Boxes on Cable Tray

Background and Explanation

This change was made primarily for the convenience of industrial users. In industrial installations of cable trays, the tray is often the only convenient place to locate an outlet box. The code panel modified the original proposal to ensure that adequate support for raceways and outlet boxes is provided.

Wed Feb 02 02:31:24 2005

331-3(6) ENT Under Concrete Slabs

Type of Change New

BRIEF SUMMARY

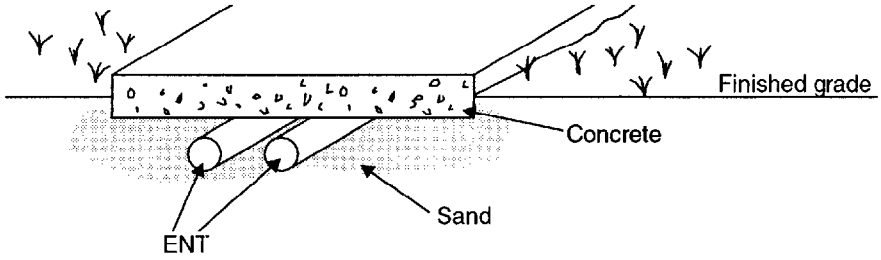
All occupancies. Electrical nonmetallic tubing is permitted under concrete slabs.

Code Language

331-3. Uses Permitted. The use of electrical nonmetallic tubing and fittings shall be permitted in the following:

•
•
•

(6) Encased in poured concrete, **or embedded in a concrete slab on grade where ENT is placed on sand or approved screenings**, provided fittings identified for this purpose are used for conditions (ROC 8-134)



ENT Permitted to Be Located Beneath Slab on Grade

Application

Where ENT is installed below a concrete slab on grade, it must be provided with a bed of sand or other screened material. With proper bedding and care during installation, ENT can be installed below concrete slabs without damage.

Background and Explanation

Electrical metallic tubing has been permitted to be encased in poured concrete in previous editions of the code. This new rule allows for the installation of ENT on a bed of sand or other suitable material prior to the pouring of the concrete slab. It was noted in the proposal that ENT has the same crush requirements as Schedule 40 rigid nonmetallic conduit.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:24 2005

331-3(8) & 300-18 ENT for Prewired Assemblies

Type of Change New and Revised

BRIEF SUMMARY

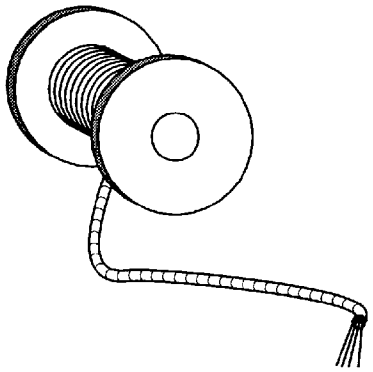
All installations. Electrical nonmetallic tubing is permitted to be used in ½-inch through 1-inch sizes for listed prewired assemblies.

Code Language

331-3. Uses Permitted. The use of electrical nonmetallic tubing and fittings shall be permitted in the following:

•
•
•

(8) ½ in. through 1 in. as listed manufactured prewired assembly (ROP 8-66)



1/2"–1" Trade sizes
Electrical nonmetallic tubing as a manufactured prewired assembly

Prewired ENT

Application

The illustration shows a reel of ENT with conductors preinstalled. This product can be used in the same locations and under the same conditions as regular ENT. Termination fittings are cemented in place at the time of installation and special tools are available to cut the tubing without damaging the conductors.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:25 2005

Background and Explanation

This is the third code cycle in which this product has been proposed. Code panel members had several objections and questions about the suitability of this product, but subsequent testing and an Underwriters Laboratories fact-finding report were able to satisfy the concerns of the panel.

This product is similar to NUC (nonmetallic underground conduit with conductors) as covered in Article 343. NUC has a greater range of sizes; however, prewired ENT assemblies can be used aboveground and are more flexible.

The term "manufactured prewired assemblies" is not defined. Other prewired assemblies using flexible metal conduit and flexible metallic tubing are recognized in Sections 350-10(a)(5) and 349-10 Exception No. 2, but these uses are subject to 6-foot length restrictions. There is no length restriction on ENT in manufactured prewired assemblies.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:25 2005

333-7 Cable Ties for Support of AC Cable

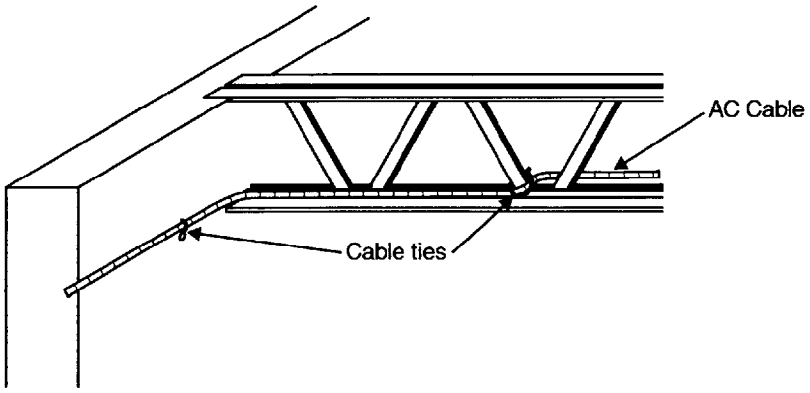
Types of Change Revised

BRIEF SUMMARY

All occupancies. The rule for support of type AC cable has been clarified.

Code Language

333-7. Support. Type AC cable shall be secured by staples, **cable ties,** straps, hangers, or similar fittings designed and installed so as not to damage the cable at intervals not exceeding 4½ ft (1.37 m) and within 12 in. (305 mm) of every outlet box, junction box, cabinet, or fitting. (ROC 7-60) (TCC 7-60)



AC Cable Support

Application

Cable ties may be used to secure type AC cable provided the cable is not damaged by their use. This gives another method to secure cables to bar joist type construction or in areas above suspended ceilings.

Background and Explanation

The use of cable ties has been a common practice in some jurisdictions. No problems have been reported as a result of this support method. Since the 1993 code, Section 336-18 has recognized the use of cable ties as a securing method for nonmetallic sheathed cables without any reported problems.

STD.NFPA NEC CHANGES-ENGL 1999 ■ 6474446 0577059 963 ■

336-4 and 336-5 Height Restriction for NM, NMC, and NMS Cables

Type of Change Revision

BRIEF SUMMARY

Residential. The three-floor height restriction on the use of NM cable in one- and two-family dwellings was removed.

Code Language

336-4. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

(1) One- and two-family dwellings

(2) Multifamily dwellings and other structures, except as prohibited in Section 336-5

(3) Cable trays, where the cables are identified for the use

(TCC 7-74) (ROC 7-138)

336-5. Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

1. In any ~~dwelling~~ **multifamily dwelling or other structure exceeding three floors above grade** (ROC 7-163)

Application

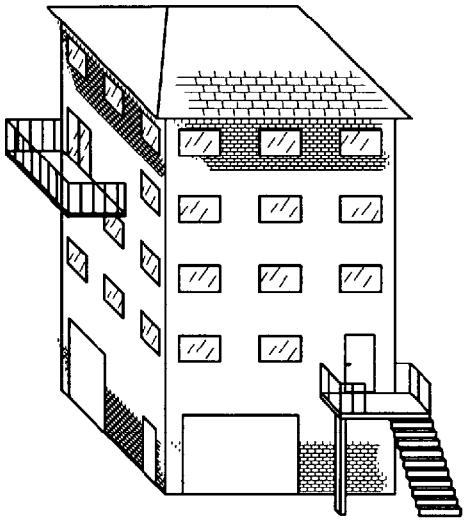
Type NM cable may be used in one- and two-family dwellings of any height. NM cable may not be used in multifamily dwellings and other structures over three floors in height.

Background and Explanation

The three-story height limit originated in the 1975 NEC and was based on concerns over physical damage occurring to the NM cable during construction on large projects where such exposure to damage increased. Although the code panel agreed to remove the height restriction on one- and two-family dwellings,

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:25 2005

the restriction remains for multifamily dwellings and other structures. Other proposals to place additional limits on the use of NM cable were defeated in the public comment period. Building codes recognize specific methods of vertical fire-rated construction (such as a 2-hour rated firewall) as a delineation that enables the construction on either side to be considered a separate building or structure. This concept does not apply to horizontal fire-rated construction.



One- or two-family dwellings, no height restriction on use of NM cable

NM Cable—Over Three Floors

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:26 2005

336-6(b) NM in Surface Raceway

Type of Change Revision

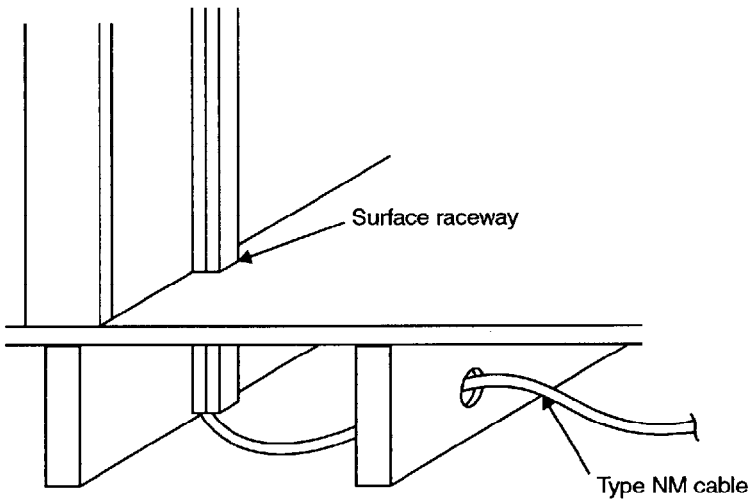
BRIEF SUMMARY

Residential and commercial. Listed surface raceways are included in the acceptable means for protecting NM cable from physical damage.

Code Language

336-6. Exposed Work—General. In exposed work, except as provided in Section 300-11(a), the cable shall be installed as specified in (a) through (d).

(b) Protection from Physical Damage. The cable shall be protected from physical damage where necessary by conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, pipe, guard strips, listed surface metal or nonmetallic raceway, or other means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC rigid metallic conduit, **listed surface metal or nonmetallic raceway**, or other metal pipe extending at least 6 in. (152 mm) above the floor.



NM Cable in Surface Raceway

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:26 2005

Application

Listed surface metal or nonmetallic raceway may be used where mechanical protection is needed for NM cable exposed to physical damage or passing through a floor. An example of such an installation is shown in the illustration.

Background and Explanation

The proposed uses for surface raceways were already included as permitted uses in Sections 352-1, 352-5, 352-22, and 352-28. The change to include surface raceways in Section 336-6(b) as a method of protecting NM cable was made to provide a more aesthetic option for protection of NM cables than the options that were previously specified.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:26 2005

336-18 Use of NM to Connect Fixtures Within Accessible Ceiling

Type of Change Revision

BRIEF SUMMARY

All occupancies. The rules for the support of nonmetallic-sheathed cables have been relaxed.

Code Language

336-18. Supports. Nonmetallic-sheathed cable shall be secured by staples, cable ties, straps, or similar fittings designed and installed so as not to damage the cable. Cable shall be secured in place at intervals not exceeding 4½ ft (1.37 m) and within 12 in. (305 mm) from every cabinet, box, or fitting. **Flat** cables shall not be stapled on edge. Cables run through holes in wood or metal joists, rafters, or studs shall be considered to be supported and secured. (ROP 7-110) (ROC 7-178)

FPN: See Section 370-17(c) for support where nonmetallic boxes are used. (ROC 7-178)

Exception No. 1: For concealed work in finished buildings or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish cable between access points. (ROC 7-178)

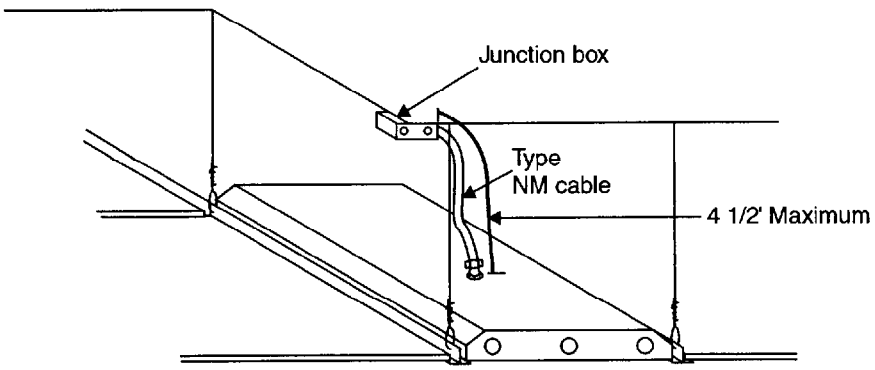
Exception No. 2: A wiring device identified for the use, without a separate outlet box, incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 4½ ft (1.37 m) and within 12 in. (305 mm) from the wiring device wall opening, and there shall be at least a 12-in. (305-mm) loop of unbroken cable or 6 in. (152 mm) of a cable end available on the interior side of the finished wall to permit replacement. (ROC 7-178)

Exception No. 3: Lengths not more than 4½ ft (1.37 m) from an outlet for connection within an accessible ceiling to lighting fixture(s) or equipment. (ROP 7-111, 7-117) (ROC 7-181)

Application

Section 300-11 prohibits the use of ceiling grid systems and support wires as support for cables and raceways. In suspended ceiling systems it is difficult to support cables within 12 inches of a lighting fixture. This revision allows Type NM cable to be installed up to 4½ feet from fixtures and equipment without support.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:27 2005



NM Cable for a Wiring of Fixtures in Accessible Ceiling

Background and Explanation

The revision recognizes the use of unsupported short sections (4½ feet) of Type NM cable as a wiring method to supply lighting fixtures or equipment within an accessible ceiling. This exception is similar to exceptions found in other articles permitting short unsupported lengths of cables and flexible or pliable raceways for fixture and equipment connections.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:27 2005

339-3(b) Physical Protection for UF Cable

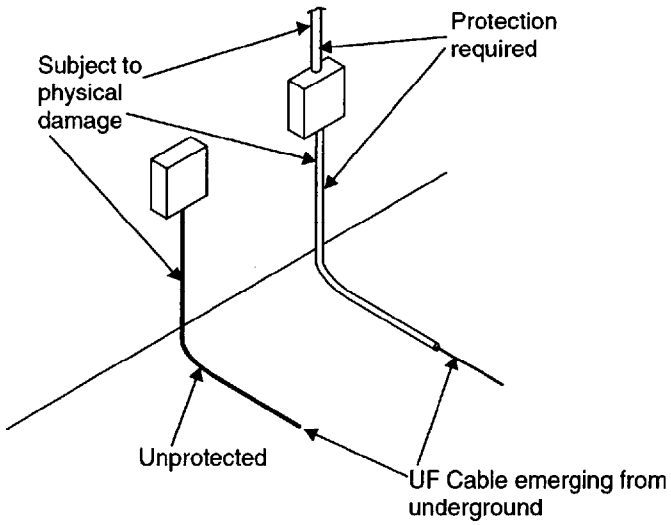
Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Type UF cable may not be installed where it would be subject to physical damage.

Code Language

339-3. Use.
(b) Uses Not Permitted. Type UF cable shall not be used in the following:
•
•
•
(10) Where subject to physical damage



Physical Protection for UF Cable

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:27 2005

Application

The illustration shows Type UF cables emerging from underground at the side of a building. The unenclosed cable is subject to physical damage by such things as lawnmowers and weed trimmers. The unprotected cable would not comply with Sections 339-3(b) and 300-5(d), therefore protection must be provided.

The other cable is protected from physical damage. According to Section 300-5(d), the cable must be protected to its required burial depth or 18 inches, whichever is less. Permitted protection methods are rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or the equivalent. Similar requirements apply to the cable that is enclosed in a raceway extending up from the junction box.

Background and Explanation

According to the substantiation, this change was meant "to address the problem of exterior installed conductors or cables where Section 300-5 and 336-6 do not apply." Article 300 applies generally unless modified by some specific provision of another section, but it is also specifically referenced in Sections 339-2 and 339-3(a)(3). Section 339-3(a)(2) references Section 336-6 (NM cable) for installation requirements when UF cable is used for interior wiring.

The installation shown in the illustration would appear to be covered by the requirements of Section 300-5. However, if UF cable is used to extend from the top of the box as shown, that cable is not covered by the reference to Section 336-6 because it is not interior wiring, and it is not covered by Section 300-5 because it is not emerging from underground. Although such an installation is not specifically permitted by the code, it is not specifically prohibited either.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:27 2005

362-6 Dimensions of Wireways Used as Pull Point

Type of Change Revision

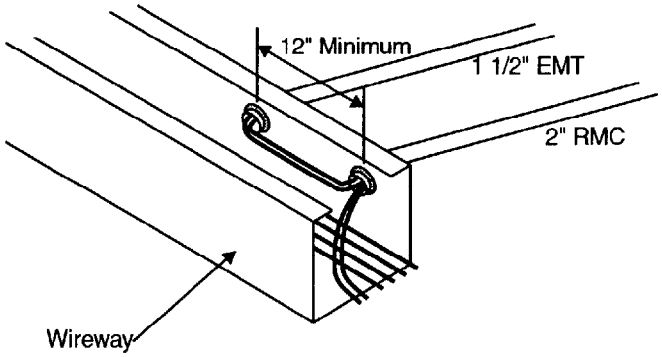
BRIEF SUMMARY

Commercial and industrial. For wireways, the minimum distance between raceway entries enclosing the same conductor is six times the trade size of the largest raceway.

Code Language

362-6. Deflected Insulated Conductors. Where insulated conductors are deflected within a wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the wireway, or where the direction of the wireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6 shall apply. **Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between those raceway and cable entries shall not be less than six times the trade diameter of the larger raceway or cable connector.**

Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between raceway and cable entries enclosing the same conductor shall not be less than six times the trade diameter of the larger raceway or cable connector.



Minimum distance between raceways enclosing the same conductor(s) is six times trade diameter of the largest raceway.

Raceway Entries to Wireways

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:28 2005

Application

Where a conductor enters a wireway in one raceway and exits through another raceway, the distance between raceway entries must be at least six times the trade diameter of the largest raceway. In the illustration, two conduits enter a wireway and two conductors enter the wireway in one conduit and leave in the other. Because the larger conduit is 2-inch trade size, the minimum separation between entries is 12 inches (6 × 2 inches).

Background and Explanation

This proposal is intended to ensure that adequate bending space is provided for conductors entering and leaving the wireway. Section 362-6 already had a rule for conductors deflected within a wireway, and that rule covered conductors entering or leaving the wireway, but it did not cover a conductor that both entered and left the wireway. The new wording is based on a similar rule for pull boxes found in Section 370-28(a)(2). Wireways are commonly used as a wire pulling location in addition to their use as raceways. In the illustration, the wireway is being used as both a raceway and a pull box in the same section. With this change, Section 362-6 covers both uses.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:28 2005

362-8(a) Support at Wireway Ends

Type of Change Revision

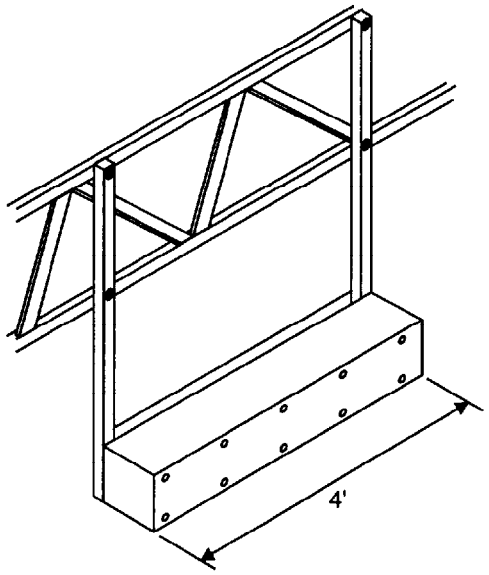
BRIEF SUMMARY

Commercial and industrial. Support requirements for wireways have been clarified.

Code Language

362-8. Supports. Wireways shall be supported in accordance with the following:

(a) Horizontal Support. Wireways shall be supported where run horizontally **at each end and** at intervals not to exceed 5 ft (1.52 m) or for individual lengths longer than 5 ft (1.52 m) at each end or joint, unless listed for other support intervals. The distance between supports shall not exceed 10 ft (3.05 m). (ROP 8-242)



Support of Horizontally Installed Wireway

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:28 2005

Application

All wireways are required to be supported at each end.

Background and Explanation

The 1996 code text could be interpreted as allowing a single support for short sections of wireway. This revision assures proper support for short sections of wireway.

362-26 Bonding of Raceways Connected to Nonmetallic Wireways

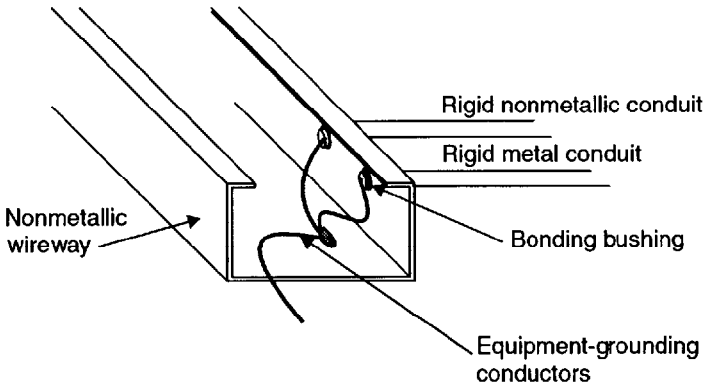
Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Required equipment grounding conductors may be installed in or bonded to metal raceway extensions from nonmetallic wireways.

Code Language

362-26. Extensions from Nonmetallic Wireways. Extensions from nonmetallic wireways shall be made with cord pendants or any wiring method of Chapter 3. A separate equipment grounding conductor shall be installed in, **or an equipment grounding connection shall be made to,** any of the wiring methods used for the extension. (ROP 8-253)



Bonding of Metal Raceways Connected to Nonmetallic Wireways

Application

When an extension is made from a nonmetallic wireway, equipment grounding conductors for the extension must be provided. Generally, equipment grounding conductors are installed in a cord pendant, a cable, or a raceway as shown in the rigid nonmetallic conduit in the illustration. However, if the raceway itself is suitable as an equipment grounding conductor, an equipment grounding connection may be made to the raceway as shown for the rigid metal conduit in the illustration.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:29 2005

Background and Explanation

This change was made to clarify that equipment grounding conductors need not be installed in conduit extensions from nonmetallic wireways if the conduit is suitable as an equipment grounding conductor. Conduit that is suitable for equipment grounding need only be bonded to an equipment grounding conductor in the wireway. Even if an equipment grounding conductor were installed in the rigid metal conduit in the illustration, the conduit would still have to be connected to the equipment grounding conductor at one end or the other to comply with Sections 250-86 and 250-96(a).

364-6(b) Curbs for Protection of Busway

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Curbing of floor penetrations for busways is required.

Code Language

364-6. Through Walls and Floors.

(a) Walls. Unbroken lengths of busway shall be permitted to be extended through dry walls.

(b) Floors. Floor penetrations shall comply with (1) and (2).

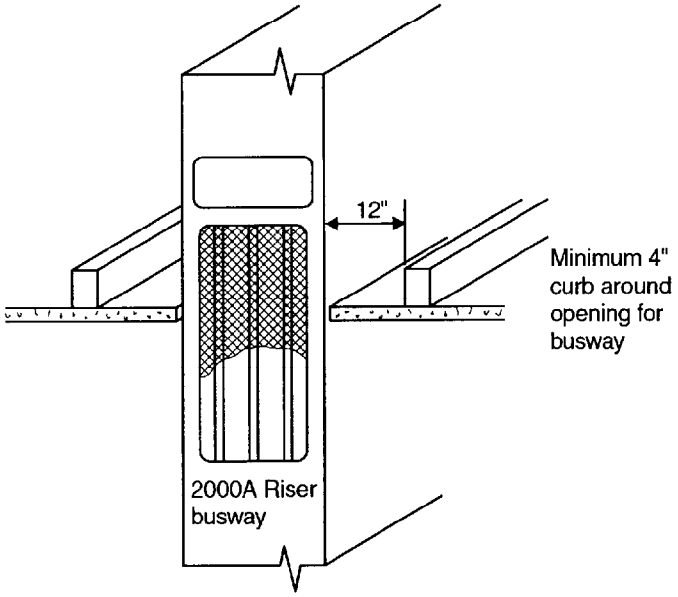
(1) Busways shall be permitted to be extended vertically through dry floors if totally enclosed (unventilated) where passing through and for a minimum distance of 6 ft (1.83 m) above the floor to provide adequate protection from physical damage.

(2) In other than industrial establishments, where a vertical riser penetrates two or more dry floors, a minimum 4-in. (102-mm) high curb shall be installed around all floor openings for riser busways to prevent liquids from entering the opening. The curb shall be installed within 12 in. (304.8 mm) of the floor opening. Electrical equipment shall be located so that it will not be damaged by liquids that are retained by the curb.

Application

Where busways penetrate two or more dry floors, a curb at least 4 inches high is required to prevent the entry of liquids. This requirement does not apply within industrial buildings.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:29 2005



Protection of Busway at Floor Penetration

Background and Explanation

Where busways penetrate dry floors, piping system failures may occur. In the event of a piping system failure, liquids can flow through the floor openings and enter the busway system. Curbing of the openings will help to eliminate this problem. It was cited that often busways are installed in areas that have toilets or janitor's closets with sinks that are occasionally subjected to overflows or spills.

370-16(b) (1) Exc. Box/Fixture Canopy Conductor Support

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. The first four fixture wires smaller than No. 14 and an equipment ground wire entering a box from a domed canopy may be omitted from box fill calculations.

Code Language

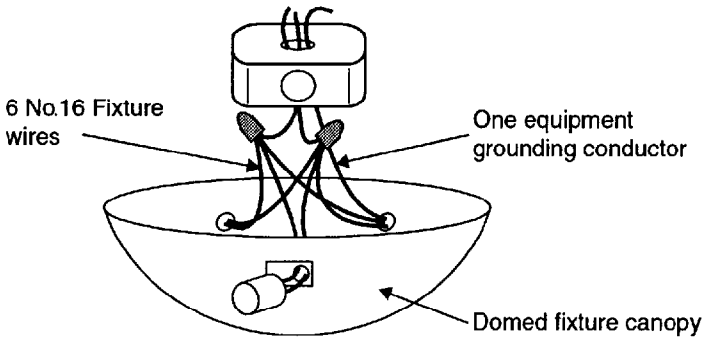
370-16. Number of Conductors in Outlet, Device and Junction Boxes, and Conduit Bodies.

•
•
•

(b) Box Fill Calculations.

(1) Conductor Fill. Each conductor that originates outside the box and terminates or is spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. The conductor fill, in cubic inches, shall be computed using Table 370-16(b). A conductor, no part of which leaves the box, shall not be counted.

Exception: An equipment grounding conductor ***or conductors*** *or not over four fixture wires smaller than No. 14, or both,* ***shall be permitted to be omitted from the calculations where they enter a box from a domed fixture or similar canopy and terminate within that box.*** (ROP 9-18, 9-21) (ROC 9-4)(ROP 9-18)



Fixture Wires in Domed Canopies

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:30 2005

Application

The illustration shows a domed fixture canopy with six No. 16 fixture wires and an equipment ground in a conductor. Only two of the No. 16 fixture wires, plus the branch-circuit conductors, must be included in the box-fill calculation.

Background and Explanation

This change is intended to clarify that up to four fixture wires and an equipment ground wire may be omitted entirely from box-fill calculations. The previous wording was sometimes interpreted to require counting all six No. 16 conductors in the illustration because there are more than four. The change also clarifies that multiple equipment grounding conductors located within the box and/or canopy are to be counted as a single conductor.

Wed Feb 02 02:31:30 2005

370-23 Box Support Requirements Revised and Clarified

Type of Change Revision

BRIEF SUMMARY

All occupancies. The support requirements for boxes and enclosures covered by Article 370 have been clarified.

Code Language

370-23. Supports. Enclosures within the scope of this article shall be supported in accordance with one or more of the provisions in (a) through (h):

•
•
•

(d) Suspended Ceilings. An enclosure mounted to structural or supporting elements of a suspended ceiling shall be not more than 100 in.^{3} (1640 cm^3) in size and shall be securely fastened in place in one of the following ways:

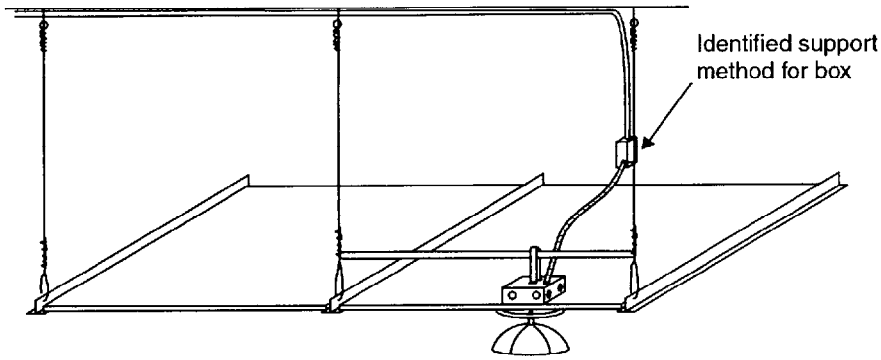
(1) Framing Members. An enclosure shall be fastened to the framing members by mechanical means such as bolts, screws, or rivets, or by the use of **clips or other securing means identified for use with the type of ceiling framing member(s) and enclosure(s) employed.** The framing members shall be adequately supported and securely fastened to each other and to the building structure.

(2) Support Wires. The installation shall comply with the provisions of Section 300-11(a). The enclosure shall be secured, using methods identified for the purpose, to ceiling support wires, including any additional support wires installed for that purpose. Support wires used for enclosure support shall be fastened at each end so as to be taut within the ceiling cavity. (ROC 9-12)

(e) Raceway Supported Enclosure, Without Devices or Fixtures. An enclosure that does not contain a device(s) or support a fixture(s) or other equipment, and is supported by entering raceways shall not exceed 100 in.^{3} (1640 cm^3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. **Each conduit shall be secured within 3 ft (914 mm) of the enclosure, or within 18 in. (457 mm) of the enclosure if all entries are on the same side.** (ROC 9-16)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:30 2005

Exception: Rigid metal, intermediate metal, or rigid nonmetallic conduit or electrical metallic tubing shall be permitted to support a conduit body ***of any size, including a conduit body constructed with only one conduit entry,*** *provided the conduit body is not larger that the largest trade size of the conduit or electrical metallic tubing.*



Box Support in Suspended Ceilings

Application

This section has been revised to provide more guidance for supporting boxes and enclosures 100 cubic inches and less within and to fire-rated and nonfire-rated suspended ceiling systems in accordance with Section 300-11(a)(2) Exception. The requirements are similar to those found in Section 300-11 for wiring. Paragraph (e) now recognizes raceway supported enclosures without devices or fixtures to be supported by two or more conduits on the same side of the box.

Background and Explanation

This section has undergone an editorial rewrite to make it more usable. Various support methods have been separated into logical groups. Information on suspended ceilings has been added and correlated with Section 300-11.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:30 2005

370-27(a) Use of Device Boxes to Support Fixtures

Type of Change Revision

BRIEF SUMMARY

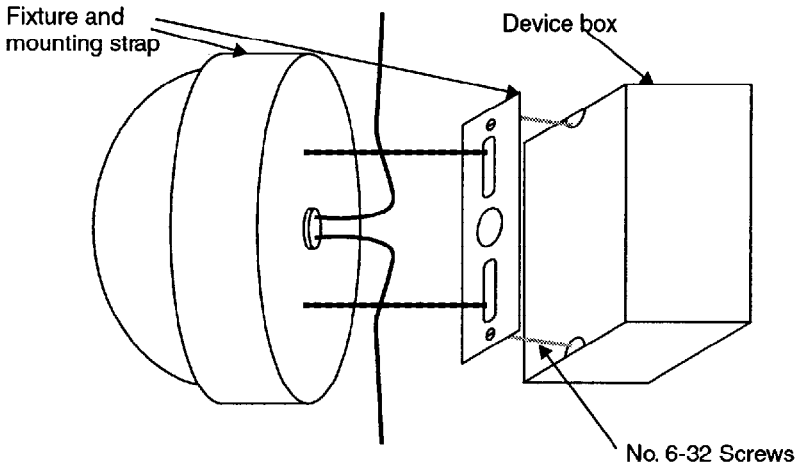
Residential and commercial. Device boxes may be used as lighting outlet boxes to support some small wall-mounted fixtures.

Code Language

370-27. Outlet Boxes.

(a) Boxes at Lighting Fixture Outlets. Boxes used at lighting fixture outlets shall be designed for the purpose. At every outlet used exclusively for lighting, the box shall be designed or installed so that a lighting fixture may be attached.

Exception: A wall-mounted fixture weighing not more than 6 lb (2.72 kg) and not exceeding 16 in. (406 mm) in any dimension shall be permitted to be supported on other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws. (ROP 9-54) (ROC 9-19a)



Device Box as Support for Wall-Mounted Fixture

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:30 2005

Application

Boxes other than those designed for use as lighting fixture outlet boxes may be used to support small wall-mounted fixtures. The fixtures must be not more than 16 inches in any dimension and must weigh no more than six pounds. The fixture or its supporting yoke must be attached by no fewer than two screws and the screws must be size No. 6 or larger. The illustration shows a small fixture and a suitable box. This method of installation is useful for small wall fixtures where the fixture base does not cover a standard ceiling box.

Background and Explanation

This change was made to recognize a common application that has been accepted by many authorities having jurisdiction. The size and weight limits are derived from Section 410-15(a), which allows similar fixtures to be supported by the screw shell of a lampholder. The wall-mounted fixture is partially a shear load, and not entirely a tension load, as is the case with a ceiling mounted fixture.

370-27(b) Exc. Boxes and Receptacle Assemblies in Show Windows

Type of Change Revision

BRIEF SUMMARY

Commercial. The type of outlet box and receptacle assembly allowed in show windows has been clarified.

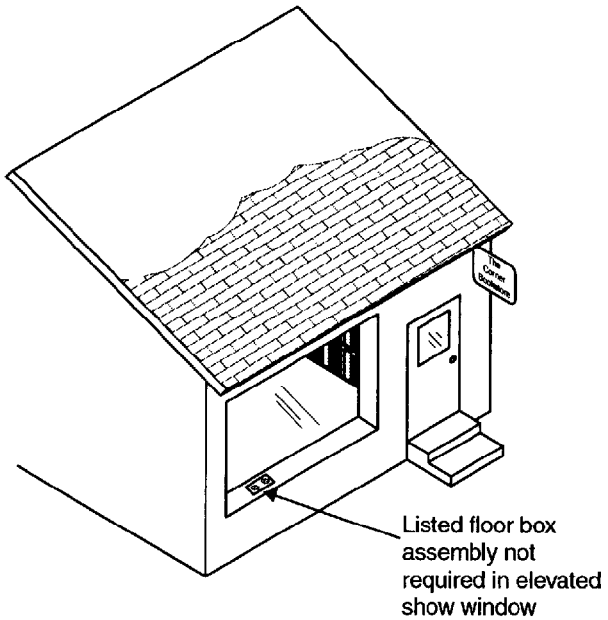
Code Language

370-27. Outlet Boxes.

•
•
•

(b) Floor Boxes. Boxes listed specifically for this application shall be used for receptacles located in the floor.

Exception: Where the authority having jurisdiction judges them free from likely exposure to physical damage, moisture, and dirt, boxes located in elevated floors of show windows and similar locations shall be permitted to be other than those listed for floor applications. ***Receptacles and covers shall be listed as an assembly for this type of location.*** (ROP 9-56)



Show Window Receptacles

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:31 2005

Application

Many show windows have elevated floors not subject to foot traffic or scrub water. In show windows of this type, listed floor boxes are not required. The receptacle and cover are listed as an assembly for this kind of use. Receptacles of the type required by this section are listed as "display receptacles."

Application of the exception is subject to the authority having jurisdiction's determing that the location is free from damage. Installers would be prudent to discuss an installation of this type with the authority having jurisdiction prior to starting the job.

Background and Explanation

Elevated floors in show windows are not subjected to the same traffic or floor washing conditions as general floor areas. This revision recognizes the difference and allows the use of listed device and cover assemblies but does not require that the box, device, and cover be listed together as a floor box assembly.

Wed Feb 02 02:31:31 2005

370-27(c) Paddle Fan Support

Type of Change Revision

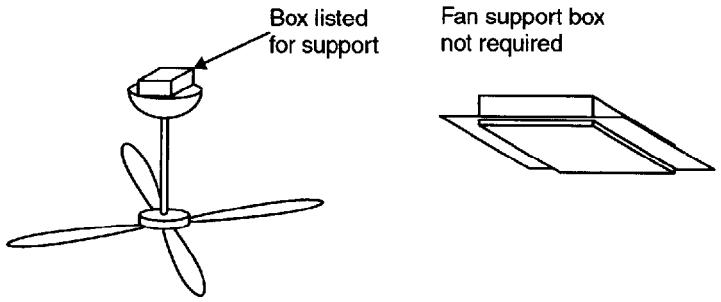
BRIEF SUMMARY

Residential and commercial. The title of this section was changed to "Boxes at Ceiling-Suspended (Paddle) Fan Outlets."

Code Language

370-27. Outlet Boxes.

(c) Boxes at Ceiling-Suspended **(Paddle)** Fan Outlets. Outlet boxes shall not be used as the sole support for ceiling-suspended **(paddle)** fans. (ROP 9-57)



Support Requirements

Application

There was no change in the technical requirements. Paddle fans require special support. Outlet boxes may not be used as the sole support for such fans unless the outlet boxes are specifically listed for the application.

Background and Explanation

The title of this section was changed for clarity. Similar wording changes were made in a number of other sections to more clearly differentiate ceiling-suspended paddle fans from other fans that may be installed in or on a ceiling.

NEC pp. 197–199

Article 370
Part D Enclosures Intended for Personnel Entry

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Requirements for manholes and other large enclosures are provided.

Code Language

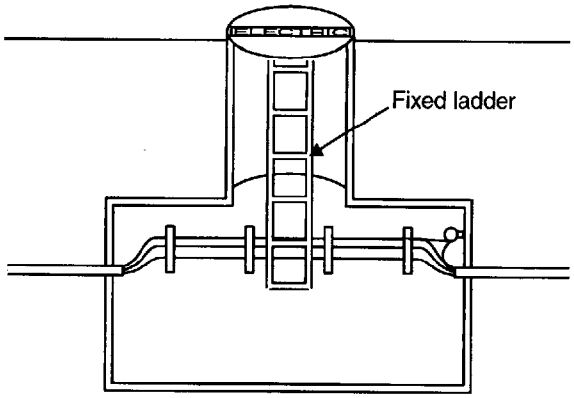
Requirements for enclosures large enough to allow entry of personnel are provided.

D. Manholes and Other Electric Enclosures Intended for Personnel Entry.
Section 370-50 gives the general requirements for adequate workspace.
Section 370-51 requires design under qualified engineering supervision to ensure adequate strength.
Section 370-52 lists the specific requirements for cabling workspace.
Section 370-53 requires adequate workspace around equipment in the manhole or vault likely to be serviced while energized.
Section 370-54 provides the requirement for adequate cable bending space.
Section 370-55 provides the requirement to ensure safe access into the enclosures.
Section 370-56 lists additional rules on entry and locking arrangements to ensure safe entry into vaults and tunnels.
Section 370-57 lists ventilation requirements.
Section 370-58 requires guarding to protect against personnel contact and prevent damage by falling objects.
Section 370-59 covers corrosion resistant ladders.

Application

This new part expands on existing rules in the NEC for subsurface enclosures and integrates requirements from Section 323 of the National Electrical Safety Code, ANSI C2.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:32 2005



Manholes in Premises Wiring System

Background and Explanation

Many large facilities have their own electric distribution systems. Manholes and vaults are frequently used in these installations. It was also noted that as electric utility deregulation increases, the number of these types of installations that are part of a premises wiring system will increase. Some of these new requirements include existing NEC rules. The remainder of this part is derived from the National Electrical Safety Code.

373-5(c) Exc. & FPN Sleeves for Cables Entering Cabinets

Type of Change New

BRIEF SUMMARY

Residential and commercial. NM cables may enter a panelboard through a conduit sleeve instead of being individually secured to the panelboard.

Code Language

373-5. Cabinets, Cutout Boxes, and Meter Socket Enclosures.

•
•
•

(c) Cables.Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure. (ROP 9-70)

Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top of a surface-mounted enclosure through one or more nonflexible raceways not less than 18 in. (457 mm) or more than 10 ft (3.05 m) in length, provided all the following conditions are met.

(a) Each cable is fastened within 12 in. (305 mm), measured along the sheath, of the outer end of the raceway.

(b) The raceway extends directly above the enclosure and does not penetrate a structural ceiling.

(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.

(d) The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.

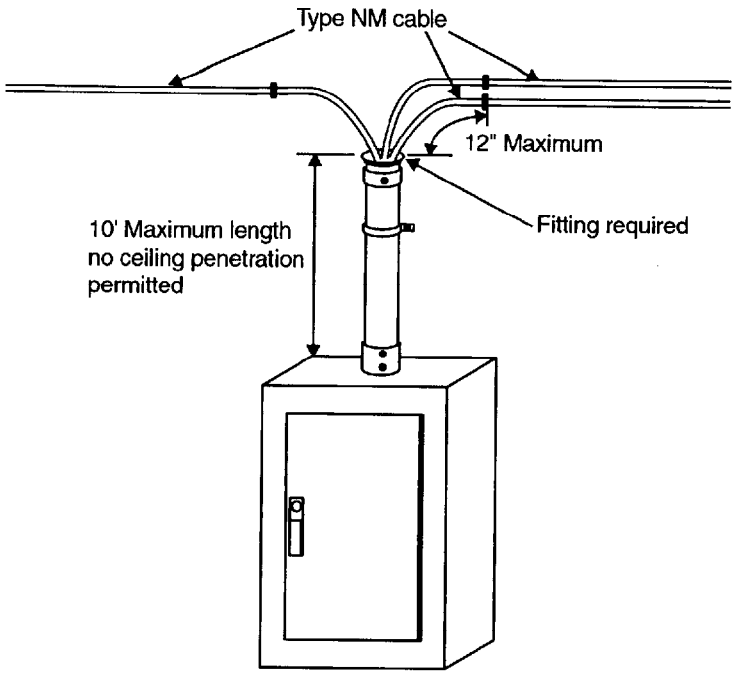
(e) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 1/4 in. (6.35 mm).

(f) The raceway is fastened at its outer end and at other points in accordance with the applicable article.

(g) Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code, and all applicable notes thereto. (ROC 9-44)

FPN: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See Section 310-15(b)(2)(a) for required ampacity reductions for multiple cables installed in a common raceway. (ROP 9-75) (ROC 9-44)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:32 2005



NM Cable and Panelboards

Application

Rather than each cable being secured to the cabinet of a panelboard, cables with a totally nonmetallic sheath may be installed in a nonflexible raceway that is not less than 18 inches long and that meets the five conditions shown in the illustration. The means of plugging the conduit end should be discussed with the authority having jurisdiction. A product like electrical putty or "duct seal" should be suitable to plug the raceway end. The conduit fill rules of Chapter 9 apply. Derating factors given in Section 310-15(b)(2)(a) also apply if the raceway is more than 24 inches long. (See Section 310-15(b)(2)(a) Exception No. 3.) If the NM cables have an elliptical cross-section, as many do, Note 9 to Table 1 in Chapter 9 requires the fill calculation to be based on using the major diameter of the ellipse as a circle diameter. The new exception still does not allow the common practice of extending a raceway through a structural ceiling or floor. However, the raceway could extend through a suspended ceiling.

Background and Explanation

The new exception recognizes a common practice that has been allowed in many jurisdictions but has been a violation of the requirement to secure each cable to a cabinet. This type of installation provides for a neat and workmanlike way of getting multiple NM cables into a panelboard. This section applies to panelboards because panelboards are, according to the definition in Article 100, assemblies designed to be placed in cabinets or cutout boxes.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:32 2005

As noted in "Application" above, derating factors may apply, and conduit fill rules do apply. Chapter 9, Table 1, Note 4 permits short pieces of raceway (nipples) not more than 24 inches long to be filled to 60 percent of their cross-sectional area. However, the wording applies this permission to nipples "installed between" enclosures. Thus, a strict reading of Note 4 would not allow its use for the raceway described in the above new exception unless approved by the authority having jurisdiction.

380-9 & 380-12 Grounding of Snap Switches and Faceplates for Switches

Type of Change Revision

BRIEF SUMMARY

All occupancies. Grounding of all snap switches is required, and the grounding requirements for metal faceplates are clarified.

Code Language

380-9. Provisions for Snap Switch Faceplates. (ROP 9-93)

(b) Grounding. Snap switches, including dimmer switches, shall be effectively grounded and shall provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered effectively grounded if either of the following conditions are met.

(1) The switch is mounted with metal screws to a metal box or to a nonmetallic box with integral means for grounding devices.

(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.

Exception to (b): Where no grounding means exists within the snap-switch enclosure or where the wiring method does not include or provide an equipment ground, a snap switch without a grounding connection shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of conducting floors or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material.

380-12. Grounding of Enclosures. Metal enclosures for switches or circuit breakers shall be grounded as specified in Article 250. Where nonmetallic enclosures are used with metal raceways or metal-armored cables, provisions shall be made for grounding continuity.

Metal boxes for switches shall be effectively grounded. **Nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment ground.** (ROP 9-95, 9-97)

Application

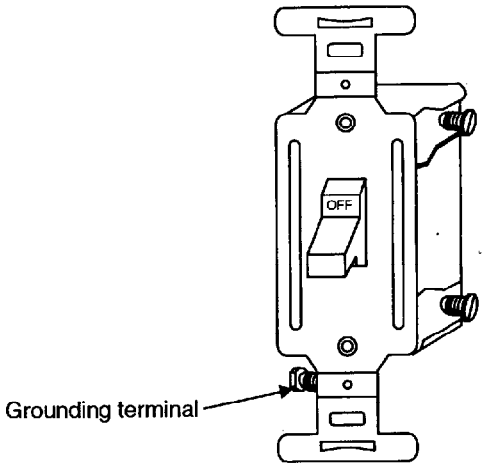
All snap switches and dimmers must be properly grounded. Grounding may be accomplished by several methods. If installed in a grounded metal box or a nonmetallic box with integral grounding means, the switch is considered to be

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:33 2005

grounded through its mounting strap and screws. The alternate method is to connect an equipment grounding conductor or bonding jumper to a terminal provided on the switch.

Metal faceplates installed on properly grounded switches will be properly grounded provided metal screws are used to secure the faceplate.

The new exception allows ungrounded switches as replacements only if there is no grounding means available. In this case a nonmetallic plate is required and nonmetallic screws should be used to eliminate potential shock hazards.



Grounding of Snap Switches and Faceplates

Background and Explanation

Section 380-9 was revised to reduce potential shock hazards. It is not uncommon for users to replace nonmetallic faceplates with metal faceplates, resulting in ungrounded and hazardous exposed metal parts if the switch has not been grounded.

The grounding requirement for metal faceplates was removed from Section 380-12. Grounding of faceplates is accomplished through the attachment of the plate to the mounting yoke of the switch and is now covered by Section 380-9.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:33 2005

384-3(a) Barriers in Service Switchboard

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The purpose of barriers in service switchboards is clarified.

Code Language

384-3. Support and Arrangement of Busbars and Conductors.

(a) Conductors and Busbars on a Switchboard or Panelboard. Conductors and busbars on a switchboard or panelboard shall **comply with (1), (2), and (3)** as applicable.

(1) Location. Conductors and busbars shall be located so as to be free from physical damage and shall be held firmly in place.

(2) Service Switchboards. Barriers shall be placed in all service switchboards **such that no uninsulated, ungrounded service busbar or service terminal will be exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.**

(3) Same Vertical Section. Other than the required interconnections and control wiring, only those conductors that are intended for termination in a vertical section of a switchboard shall be located in that section.

Exception: Conductors shall be permitted to travel horizontally through vertical sections of switchboards where such conductors are isolated from busbars by a barrier. (ROP 9-103)

Application

Service busbars and terminals must be provided with barriers to prevent personnel from making accidental contact with energized parts while performing maintenance on energized equipment. Where barriers are removed during installation they must be replaced before the switchboard is energized.

Background and Explanation

The wording in the 1996 NEC did not clearly reflect the purpose of barriers. Manufacturers install barriers in accordance with UL standards. Due to the unclear wording, some jurisdictions have required switchboards to have barriers that exceeded the intent of this section. The requirements of this section apply only to service terminals and busbars that could be contacted by personnel working on the service load terminations.

384-14 Definitions of Power and Lighting and Appliance Panelboards

Type of Change Revision

BRIEF SUMMARY

All installations. The definition of a lighting and appliance branch-circuit panelboard has been revised. A new definition and overcurrent protection requirements have been provided for power panelboards.

Code Language

384-14. Classification of Panelboards. Panelboards shall be classified for the purposes of this article as either lighting and appliance branch-circuit panelboards or power panelboards.

(a) Lighting and Appliance Branch-Circuit Panelboard. A lighting and appliance branch-circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits. A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors. (ROP 9-120)

(b) Power Panelboard. A power panelboard is one having 10 percent or fewer of its overcurrent devices protecting lighting and appliance branch circuits. (ROP 9-120)

Application

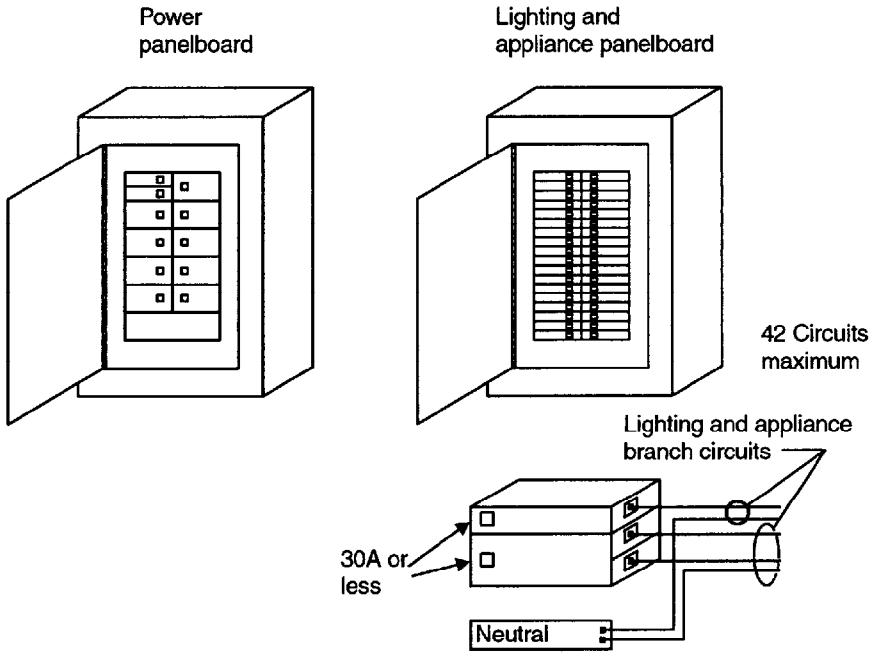
The definition of a lighting and appliance branch circuit is illustrated in the accompanying diagram. A lighting and appliance branch circuit is a circuit rated 30 amperes or less, with one or more ungrounded conductors and a conductor connected to the neutral.

The definitions of lighting and appliance branch-circuit panelboards and power panelboards are also provided and it is important to note the differences. Lighting and appliance branch-circuit panelboards are panelboards with more than 10 percent of their overcurrent devices protecting lighting and appliance branch circuits. Those panelboards that have 10 percent or fewer of their overcurrent devices protecting lighting and appliance branch circuits are defined as power panelboards.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:33 2005

There are two primary differences between the way lighting and appliance and power panelboards are used. The first difference is in the number of overcurrent devices allowed. Lighting and appliance branch-circuit panelboards are limited to 42 overcurrent devices in any one cabinet by Section 384-15. Power panelboards are not limited in the number of overcurrent devices.

The second difference is in the way overcurrent protection is provided. Lighting and appliance branch-circuit panelboards must be protected by not more than two main overcurrent devices that will limit the load to the rating of the panelboard. Power panelboards generally are required to have a rating adequate for the load as outlined in Section 384-13, but they are not required to be protected at their ratings. However, power panelboards must be protected by a single main overcurrent device with a rating not greater than that of the panelboard where the panelboard is supplied by a set of conductors that includes a neutral conductor and more than 10 percent of the overcurrent devices are rated 30 amperes or less.



Panelboard Definitions

Background and Explanation

In the "Application" above a distinction is made between the overcurrent protection requirements for different classes of panelboards. Section 384-16(b) states that "... a power panelboard with neutral connections available and more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less shall be protected on the supply side by an overcurrent device having a rating not greater than that of the panelboard." This statement must be examined carefully. Note that if the 30-ampere or lower-rated overcurrent devices were protecting circuits that included neutral conductors, those circuits would be lighting and appliance branch circuits, and the panelboards

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:34 2005

would be lighting and appliance branch-circuit panelboards. A distinction is made here between panelboards with circuits that *use* neutral connections and panelboards where neutral connections are *available*. Panelboards that are supplied by a set of conductors that does not include a neutral conductor are power panelboards by definition. But power panelboards supplied by a set of conductors that includes a neutral conductor can be modified to become lighting and appliance branch-circuit panelboards simply by adding a few small appliance branch circuits. Of course panelboards that supply only feeders are also power panelboards by definition.

These changes were inspired by a long-standing controversy over the proper interpretation of the definition of lighting and appliance branch-circuit panelboards. The definition of lighting and appliance branch-circuit panelboard in the 1993 (and 1996) code said "a lighting and appliance branch-circuit panelboard is one having more than 10 percent of its overcurrent devices rated 30 amperes or less, for which neutral connections are provided." A proposal for the 1996 code suggested that the varying interpretations of this rule could be resolved by replacing the phrase "for which neutral connections are provided" by either "and installed in circuits containing a grounded conductor" or "for which branch-circuit grounded conductor connections are provided, whether or not utilized." This highlighted the issue raised above, that is, the distinction between neutral connections used and neutral connections available. It also highlighted another issue: Is there a reason to continue to distinguish between different classes of panelboards? These issues were assigned to a task group to study during the 1999 code cycle.

The task group decided to recommend that the distinction between different classes of panelboards be retained. The original distinction seems to have been based on limiting the number of overcurrent devices in a panelboard to limit the "volume of combustible rubber-insulated wire that might otherwise end up in a panelboard." The reason given by the task group for continuing to make the distinction is that "panelboards with appreciable numbers of small branch circuits and neutral connections present (whether or not utilized) appear to be the ones that are most likely to have additional circuits and loads added from time to time, and under the least rigorous supervision or likelihood of inspection." For this reason, it was determined that such panelboards should continue to have overcurrent protection provided to limit the load to the capacity of the panelboard busing.

Based on these findings, the definition of lighting and appliance branch-circuit panelboards was modified, and the decision was made to define the rest of the panelboards as power panelboards. This retained the old limitations on lighting and appliance branch-circuit panelboards. In addition, those power panelboards that were likely to be used or modified to become lighting and appliance branch-circuit panelboards are also required to have main overcurrent protection to limit the load to the rating of the panel.

Wed Feb 02 02:31:34 2005

384-16(b) Overcurrent Protection of Power Panelboards

Type of Change New

BRIEF SUMMARY

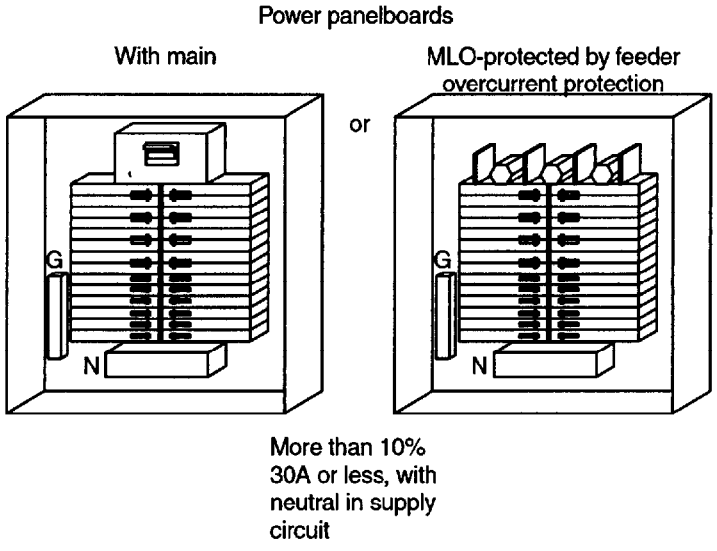
Commercial and industrial. A requirement for the protection of power panelboards has been added.

Code Language

384-16. Overcurrent Protection.

(b) Power Panelboard Protection. In addition to the requirements of Section 384-13, a power panelboard with supply conductors that include a neutral and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less shall be protected on the supply side by an overcurrent protective device having a rating not greater than that of the panelboard. (ROP 9-120) (ROC 9-79)

Exception: This individual protection shall not be required for a power panelboard used as service equipment with multiple disconnecting means in accordance with Section 230-71. (ROP 9-120)



Power Panelboard Overcurrent Protection

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:34 2005

Application

The new description of a power panelboard in Section 384-14(b) is a panelboard with not more than 10 percent of the overcurrent devices in lighting and appliance circuits. Lighting and appliance circuits are rated 30 amperes or less and supply line to neutral loads.

New Section 384-16(b) requires power panelboards that contain a neutral bus and more than 10 percent of the circuits rated 30 amperes or less to be protected by an overcurrent device not larger than the panelboard rating. This protection is required even if none of the circuits are connected line to neutral. The conditions in the rule are based on the presence of a neutral bus, a neutral conductor, and the rating of the circuits. The new exception allows the overcurrent protection to be omitted where the panelboard is service equipment with multiple disconnects.

Background and Explanation

The changes in Sections 384-14 and 384-16 were made as a result of the task group study of proposals and comments held over from the 1996 NEC. As a result of the work done by the task group, Section 384-14 was revised to clearly define two types of panelboards. Section 384-16 was revised, providing rules for the protection of both types of panelboard.

A power panelboard provided with a neutral bus can easily be changed to a lighting and appliance panelboard by increasing the number of lighting and appliance branch circuits supplied. The addition of Section 384-16(b) is intended to provide adequate protection for this type of equipment.

384-16(e) Panelboards Protected by Transformer Primary Overcurrent Device

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Panelboards supplied through a delta-delta transformer may be protected by the transformer primary overcurrent device.

Code Language

384-16. Overcurrent Protection.

•
•
•

(e) Supplied Through a Transformer. Where a panelboard is supplied through a transformer, the overcurrent protection in (a), (b), and (c) shall be located on the secondary side of the transformer. (ROP 9-120)

Exception: A panelboard supplied by the secondary side of a transformer ~~having a 2-wire (single voltage) secondary~~ shall be considered as protected by the overcurrent protection provided on the primary side of the transformer ***where that protection is in accordance with Section 240-21(c)(1)***. (ROP 9-121) (ROC 9-81a)

Application

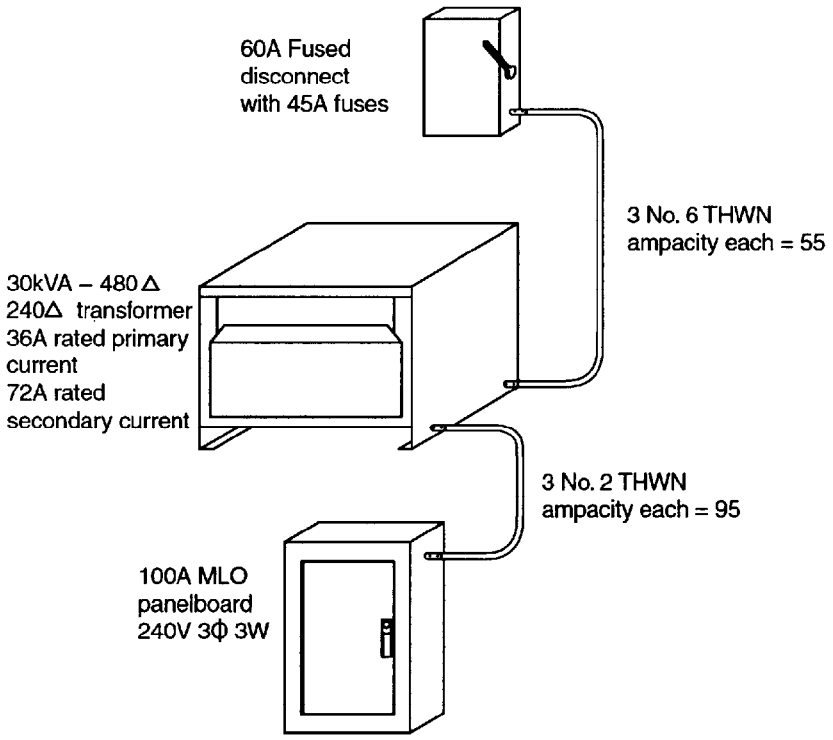
The illustration shows a typical application of this rule. The rated primary current of the 30kVA transformer is 36 amperes. According to Section 450-3(b), this transformer can be protected at 125 percent of the primary current rating. 125% × 36 amperes = 45 amperes, so the transformer can be protected by a 45-ampere overcurrent device, in this case, a fuse. This fuse also protects the No. 6 THWN primary conductors because the conductor ampacity is 55 amperes.

Now, according to Section 240-3(f) and 240-21(c), the secondary conductors can be protected by the primary overcurrent device if the primary device protects the transformer (determined above) and the rating of the primary overcurrent device does not exceed the product of the secondary conductor ampacity and the secondary to primary voltage ratio. The ampacity of the No. 2 THWN secondary conductor is 95 amperes, selected from the 60 column in accordance with Section 110-14(c). The secondary to primary voltage ratio is 240/480 = 0.5. The maximum primary fuse that could protect the secondary

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:35 2005

conductors is 95 amperes × 0.5 = 47.5 amperes, so the secondary conductors are protected by the 45-ampere primary fuse. Only single-phase, 2-wire to 2-wire or three-phase, delta-delta, 3-wire secondary transformers can be protected in this manner.

Finally, the panelboard can be protected in a manner similar to that for the secondary conductors. The transformer is already protected. The rating of the panelboard is 100 amperes. The maximum primary fuse rating that will also protect the panelboard is 100 × 0.5 = 50 amperes, so the panelboard is also protected by the 45-ampere fuses. This method of protecting a panel or secondary conductors can only be used when the transformer has a 2-wire single-voltage secondary or is a 3-phase delta-delta transformer with a 3-wire single-voltage secondary.



Primary Protection and Panelboards

Background and Explanation

The use of a primary device to protect the secondary conductors of a delta-delta transformer was first recognized in Section 240-3(i) in the 1996 NEC. This change simply extends that protective technique to panelboards.

Notice that the 3-phase, 3-wire panelboard in the example can only be a power panelboard because a lighting and appliance branch-circuit panelboard must include a neutral by definition, and, in this case, the delta secondary has no neutral. Similarly a 2-wire secondary has a grounded conductor that is not a neutral.

Table 400-4 New Type Portable Power Cable (G-GC)

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Type G-GC cable has been added to the table.

Code Language

See accompanying table.

Background and Explanation

Type G-GC cable is similar to Type G, but it also contains an insulated ground check (GC) conductor. This cable has been in common use in industrial occupancies for quite some time. The addition of Type G-GC recognizes the use of the product. The ground-check conductor is used on a low-voltage system to monitor equipment-grounding continuity. Where continuity is not maintained, the circuit is automatically de-energized.

400-7 Use of Cords with Portable and Mobile Signs

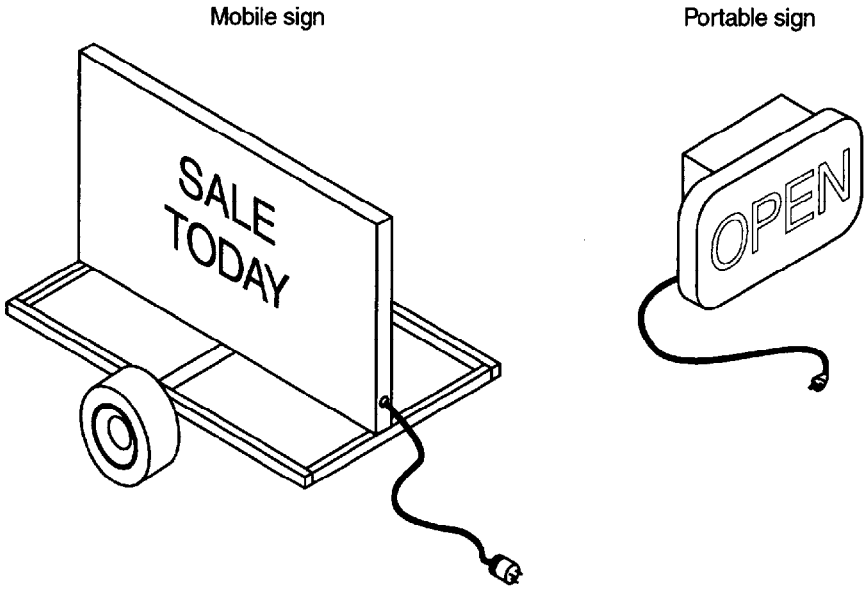
Type of Change Revision

BRIEF SUMMARY

Commercial. Portable and mobile signs may be wired with flexible cords and attachment plugs.

Code Language

400-7. Uses Permitted.
(a) Uses. Flexible cords and cables shall be used only for the following:
•
•
•
(3) Connection of portable lamps, **portable and mobile signs**, or appliances



Use of Cords for Signs

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:36 2005

Application

The illustration shows examples of portable and mobile signs with flexible cords and attachment plugs. The new language in Section 400-7(a)(3) allows the use of cords for these purposes, and the existing language of Section 400-7(b) requires attachment plugs for these cords.

Background and Explanation

These changes were made to correlate with Article 600 and UL 48, both of which allow cords on signs of this type. Portable signs are distinguished from mobile signs by the standard definitions of the terms. A portable sign is capable of being carried, and a mobile sign is movable, not fixed or stationary.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:36 2005

400-8(2) Cords Not Permitted Through Holes in Suspended Ceilings

Type of Change Revision

BRIEF SUMMARY

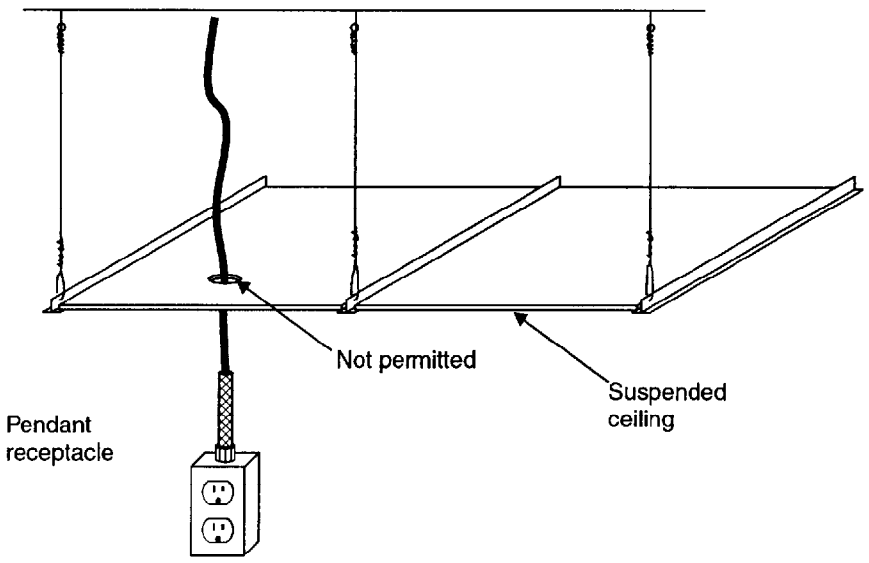
All occupancies. Uses not permitted for flexible cord are clarified.

Code Language

400-8. Uses Not Permitted. Unless specifically permitted in Section 400-7, flexible cords and cables shall not be used for the following:

•
•
•

(2) Where run through holes in walls, **structural** ceilings, **suspended ceilings, dropped ceilings**, or floors (ROP 6-128) (ROC 6-75)



Cords Through Hole in Ceiling Not Permitted

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:36 2005

Application

Flexible cords and cables are not permitted to be run through holes in any type of ceiling including suspended or dropped ceilings. Another change to this section prohibits cords and cables from being concealed in the space above a suspended ceiling.

Background and Explanation

The 1996 NEC only used the term "ceilings" and some confusion existed as to whether it encompassed dropped and suspended ceilings. This revision clarifies that the rule applies to suspended or dropped ceilings as well as structural ceilings. If a cord is damaged above a suspended ceiling, the damage is not likely to be detected. The use of cords through holes in metal ceiling assemblies was cited as an area in which cords could be damaged.

Wed Feb 02 02:31:36 2005

410-4(a) & (d) Bathroom Paddle Fan Installation

Type of Change Revision

BRIEF SUMMARY

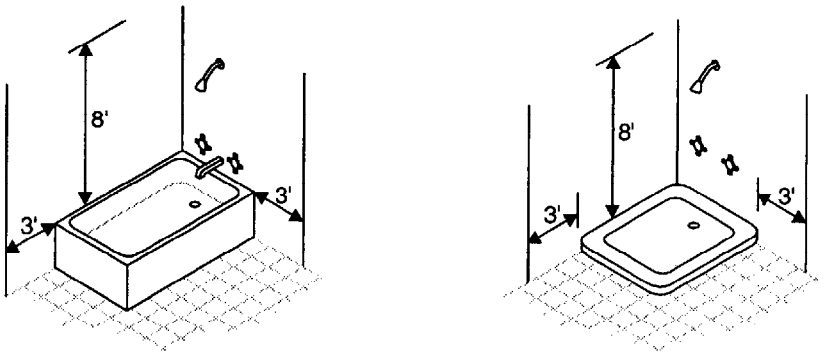
All locations. Descriptions of damp and wet locations were removed, and provisions for equipment above and around tubs were clarified and extended to include shower stalls.

Code Language

410-4. Fixtures in Specific Locations.

•
•
•

(d) Bathtub and **Shower** Areas. No parts of cord-connected fixtures, hanging fixtures, lighting track, pendants, or ceiling-**suspended (paddle)** fans shall be located within a zone measured 3 ft (914 mm) horizontally and 8 ft (2.44 m) vertically from the top of the bathtub rim or **shower stall threshold.** This zone is all encompassing and includes the zone directly over the tub **or shower stall.** (ROP 18-13)



Bathtub zone Shower zone

Restricted Spaces at Tubs and Showers

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:36 2005

Application

The restricted areas around a tub or shower are shown in the illustration. Equipment is excluded from these areas unless suitable for the location and not otherwise prohibited. Equipment prohibited includes cord-connected fixtures, hanging fixtures, lighting track, pendants, and ceiling-suspended (paddle) fans. Equipment that may be installed in the restricted area include recessed fixtures, recessed exhaust fans, and surface-mounted fixtures. Of course, permitted equipment must be marked as suitable for the damp or wet location.

Background and Explanation

A proposal to define the area up to eight feet above a shower or tub as a damp location was not accepted. In addition, the definitions of "damp" and "wet" locations that appeared in the second and third paragraphs of Section 410-4(a) in the 1996 code were deleted because the terms are defined in Article 100. The language in Section 410-4(d) for bathtub or shower areas was also changed to clarify that the restrictions on fans within eight feet vertically and three feet horizontally apply to ceiling-suspended (paddle) fans, not to recessed exhaust fans. The heading and wording of Section 410-4(d) were changed to include shower stalls as well as bathtubs.

Wed Feb 02 02:31:37 2005

410-4(c) Lighting Fixtures in Commercial Cooking Hoods

Type of Change Revision

BRIEF SUMMARY

All locations. The requirements for lighting fixtures installed in commercial cooking hoods in all occupancies have been clarified.

Code Language

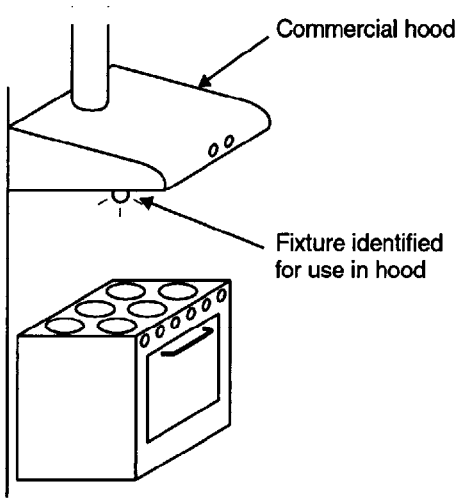
410-4. Fixtures in Specific Locations.

•
•
•

(c) In Ducts or Hoods. Fixtures shall be permitted to be installed in **commercial** cooking hoods ~~of nonresidential occupancies~~ where all of the following conditions are met.

•
•
•

(ROP 18-6)



Lighting Fixtures in Commercial Cooking Hoods

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:37 2005

Application

Commercial cooking hoods and other commercial kitchen appliances typically used in restaurants are installed in some custom kitchens in residential occupancies. Where hoods are installed in any occupancy type, lighting fixtures may be installed in the hood. The requirements of Section 410-4(c)(1) through (4) must be satisfied.

Background and Explanation

The wording in the 1996 NEC seemed to imply that lighting was not allowed in commercial hoods installed in a dwelling. The revised wording clearly reflects that the code does not prohibit such installations provided all of the requirements for the type and construction of the fixture(s) and location of the supply wiring are complied with.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:37 2005

410-11 & FPN Through-Wiring in Recessed Fixture Junction Boxes

Type of Change Revision

BRIEF SUMMARY

All occupancies. Clarification is provided of when boxes integral to recessed fixtures can be used for through-wiring.

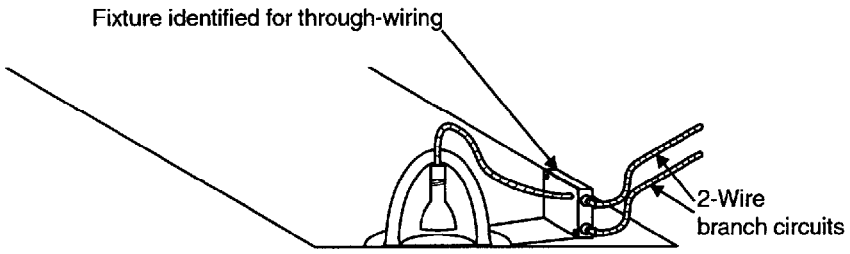
Code Language

410-11. Temperature Limit of Conductors in Outlet Boxes. Fixtures shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.

Branch-circuit wiring, **other than 2-wire or multiwire branch-circuits supplying power to fixtures connected together**, shall not be passed through an outlet box that is an integral part of a ~~an incandescent~~ fixture unless the fixture is identified for through-wiring. (ROP 18-25)

FPN: See Section 410-31, Exceptions No. 2 and 3 for circuits supplying power to fixtures connected together. (ROC 18-9)

(ROP 18-25)



Through-Wiring of Fixtures

Application

A junction box integral to a recessed fixture can be used to interconnect groups of fixtures. A 2-wire circuit or a multiwire circuit may pass through the box to supply groups of fixtures. In this case the fixture is not required to be identified for through-wiring. Other circuits may pass through a box only if the fixture is identified as suitable.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:37 2005

Background and Explanation

The revised wording clarifies the rule. The term "incandescent" was deleted. Electric discharge fixtures are available with integral boxes listed for through-wiring. This change clarifies that listed fixtures (electric discharge and incandescent) with an integral junction box are permitted to be wired "fixture to fixture." Note that markings on a fixture may restrict the number and size of the supply conductors and in addition may specify the permitted wiring method.

Wed Feb 02 02:31:38 2005

410-15(b) Metal Lighting Poles as Raceways

Type of Change Reorganization

BRIEF SUMMARY

All installations. Requirements for metal poles enclosing conductors were reorganized and clarified.

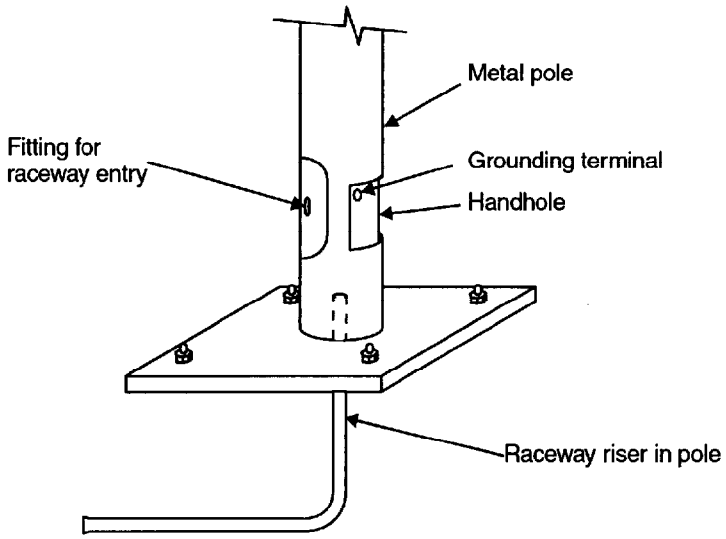
Code Language

410-15. Supports

•
•
•

(b) Metal Poles Supporting Lighting Fixtures. Metal poles shall be permitted to be used to support lighting fixtures and **as a raceway** to enclose supply conductors, provided the following conditions are met. (ROC 18-11)

•
•
•



Metal Lighting Poles

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:38 2005

Application

The parts of a metal pole are shown in the illustration. The requirements for metal poles are summarized in the following outline:

410-15(b) Metal Poles Supporting Light Fixtures—Requirements

(1) Handhole with raintight cover required

Exception No. 1: ***Handhole not required for poles 8 feet or less in height.***

Exception No. 2: ***Handhole not required for poles 20 feet or less with hinged bases.***

(2) Fitting opposite handhole required if raceway or cable risers are not in pole.

(3) Grounding terminal required in pole.

a. Grounding terminal must be accessible from handhole when handhole required.

b. Grounding terminal must be accessible from base when base is hinged.

Exception: ***Grounding terminal not required for poles less than 8 feet under certain conditions.***

(4) Base must be bonded to pole when pole has a hinged base.

(5) Equipment grounding conductors must be bonded to pole.

(6) Conductors in poles must be supported per Section 300-19.

Background and Explanation

This change is primarily editorial, with the added clarification that metal poles, though not listed as raceways, may be used as raceways to enclose conductors. Because the pole is being treated as a raceway, the separation requirements between power conductors and the conductors covered by Articles 640, 725, 760, 800, and 820 are applicable.

Wed Feb 02 02:31:38 2005

410-16(a) Boxes Listed for Support of Fixtures Over 50 Pounds

Type of Change Revision

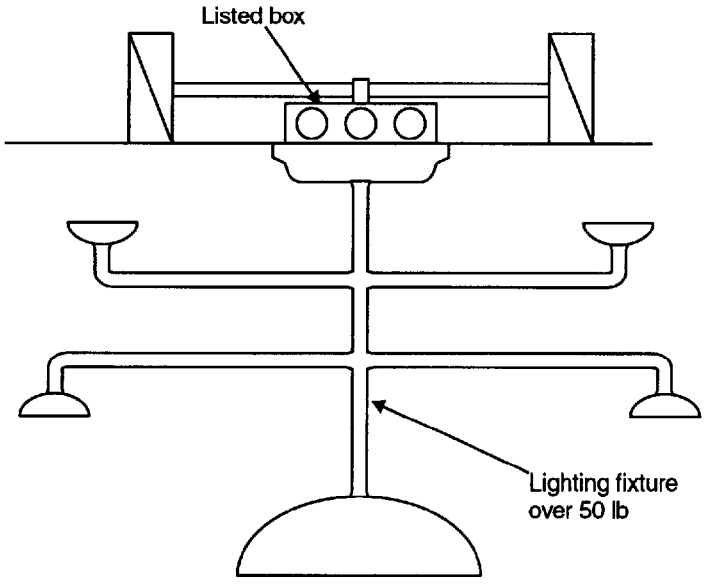
BRIEF OF SUMMARY

All occupancies. Boxes are available that are listed for support of fixtures in excess of 50 lb.

Code Language

410-16. Means of Support.

(a) Outlet Boxes. Outlet boxes or fittings installed as required by Section 370-23 shall be permitted to support fixtures weighing 50 lb (22.7 kg) or less. A fixture that weighs more than 50 lb (22.7 kg) shall be supported independent of the outlet box **unless the outlet box is listed for the weight to be supported.** (ROP 18-31)



Support of Fixtures Over 50 Pounds

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:38 2005

Background and Explanation

For many years outlet boxes have not been available listed for support of fixtures in excess of 50 lb. This section, therefore, required independent support for fixtures in excess of 50 lb. Listed boxes are now available for heavier fixtures. These boxes may be used, without independent support, up to their weight limit. Many large chandeliers weigh in excess of 50 lb.

Wed Feb 02 02:31:38 2005

410-16(c) Listing of Fixtures Clips Used in Suspended Ceilings

Type of Change Revision

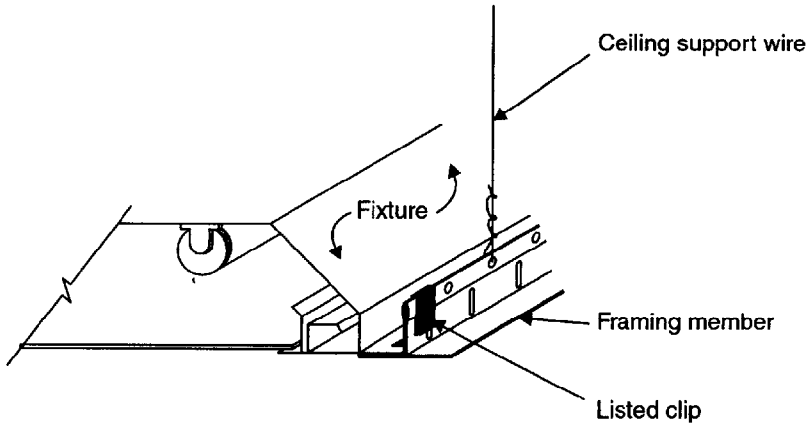
BRIEF SUMMARY

Commercial and residential. Clips used to attach fixtures to ceiling framing members must be listed for compatibility with the fixture and the framing members.

Code Language

410-16. Means of Support.

(c) Suspended Ceilings. Framing members of suspended ceiling systems used to support fixtures shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Fixtures shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. **Listed** clips identified for use with the type of ceiling framing member(s) and fixture(s) shall also be permitted. (ROP 18-38)



Attaching Fixtures to Ceiling Framing Member

Application

Where clips are used to attach fixtures to suspended ceiling framing members, the clips must be listed for use with both the type of fixture and the type of ceiling framing. Listed fixtures supplied with integral clips must identify the type of ceiling framing member with which they are intended to be used. The illustration shows a typical lay-in-type fixture installation with a clip of the type covered by the revised rule.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:39 2005

Background and Explanation

Many clips for attaching fixtures to ceiling grids are identified but not listed. This change will require listed clips. Clips that are a part of a listed fixture should be considered as meeting the listing requirement for the clips if the ceiling types are also identified in the fixture installation instructions.

Clips are not required to be used where other methods of attachment are used. Building code requirements for "slack wires" or "seismic support wires" are in addition to the NEC requirement for attaching fixtures to ceiling grids, where the grid is used as the means of support for the lighting fixtures.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:39 2005

410-56(c) Grounding of Metal Faceplates Used with IG Receptacles

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The grounding requirement for isolated ground receptacles has been clarified.

Code Language

410-56. Rating and Type.

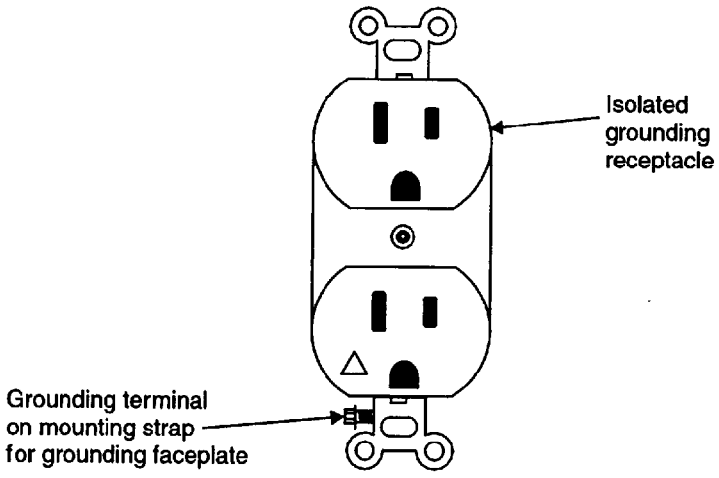
•

•

•

(c) Isolated Ground Receptacles. Receptacles intended for the reduction of electrical noise (electromagnetic interference) as permitted in Section **250-146(d)** shall be identified by an orange triangle located on the face of the receptacle. Receptacles so identified shall be used only with grounding conductors that are isolated in accordance with Section **250-146(d)**. Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate. (ROP 18-59)(ROC 18-47)

Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate. (ROC 18-47)



Faceplate Grounding with Isolated Ground Receptacles

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:39 2005

Application

Section 410-56(d) requires grounding of metal faceplates. Grounding of the faceplate is usually accomplished through the screws securing the plate to the device. With an isolated ground receptacle the mounting yoke of the device is usually grounded through the screws securing the device to a grounded box.

Where an isolated ground device is installed in a nonmetallic box, the device yoke remains ungrounded, depending on the isolated ground receptacle design. A metal faceplate would also be ungrounded. The 1996 NEC required a nonmetallic faceplate in this application. Revision of this section allows the use of a nonmetallic plate or an effectively grounded metal faceplate.

Background and Explanation

Some nonmetallic boxes contain provision for the grounding of device yokes. As revised, this rule recognizes the installation of an isolated ground receptacle in this type of box. The box design provides for the grounding of the receptacle mounting strap and the metal faceplate.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:39 2005

410-56 (f)(3) Mounting Requirements for Cover-Mounted Receptacles

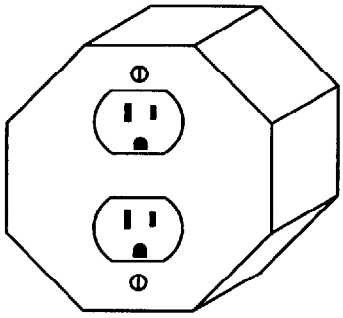
Type of Change Revision

BRIEF SUMMARY

All occupancies. Requirements for mounting of receptacles secured to covers have been clarified.

Code Language

410-56. Rating and Type.
(f) Receptacle Mounting.
(3) Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be secured by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw. (ROP 18-62, 18-63a) (ROC 18-53)



Receptacle to be mounted with not fewer than two screws

Cover-Mounted Receptacles

Application

When receptacles are secured and supported by a box cover, the general rule requires more than one screw. Receptacle attached to covers with a single No.6-32 screw have been found to become loose with use. To eliminate this problem more than one screw is required. There are listed multiple receptacle assemblies designed to be plugged into an existing receptacle outlet. These are listed for use with a single supporting screw that attaches the assembly to the cover-mounting hole of the receptacle.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:39 2005

Background and Explanation

The 1996 NEC only addressed raised covers, which are referred to as industrial covers. Covers used on octagonal boxes are flat covers. The problem of loose receptacles occurs with both raised and flat covers. The revised wording of the 1999 code includes both types of covers.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:40 2005

410-56(g) Live Exposed Parts of Cord Cap Prohibited

Type of Change Revision

BRIEF SUMMARY

All installations. Power may not be supplied by the exposed energized blades of an attachment plug.

Code Language

410-56. Rating and Type.

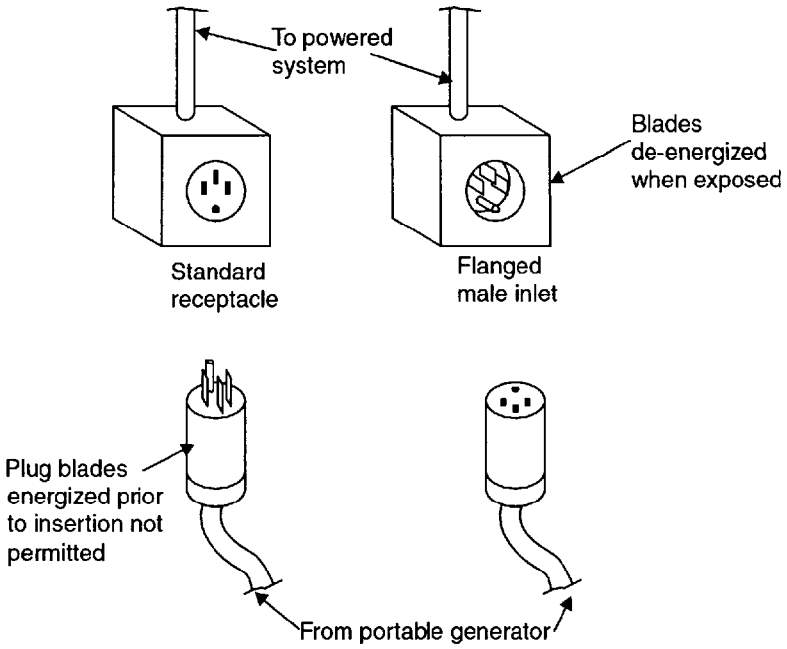
•
•
•

(g) Attachment Plugs. All 15- and 20-ampere attachment plugs and connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part, which is essential for the operation of an attachment plug or connector (dead-front construction). **Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle. No receptacle shall be installed so as to require an energized attachment plug as its source of supply.** (ROP 18-62, 18-63a)

Application

Where power is supplied from a portable power source through a cord and plug connection, the blades of an attachment plug may not be energized except when inserted in the mating receptacle or connector body. The illustration shows cords supplying power from a generator. The cord on the left has an attachment plug with exposed blades that are energized while the generator is running, even while the plug is not connected. The other cord has a connector body that guards the energized parts from contact. The exposed blades of the flanged mating plug remain de-energized until the connector body supplied by the generator is attached. If the powered system as shown in the illustration has another source of supply, a transfer switch must be employed to keep the exposed blades of the flanged plug from being energized while exposed and not in use.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:40 2005



Exposed Energized Plug Blades Prohibited

Background and Explanation

A similar rule that covers recreational vehicles was previously provided in Section 551-47(p)(4). This new rule applies generally to other applications where power sources or supplied equipment are portable. Many residential, commercial and industrial facilities have provisions to connect the premises wiring system to a portable generator. The illustration given matches the substantiation for this change, where the powered system is fixed and the power source is portable. An optional standby system for fixed equipment might use such a connection scheme. The illustration might also apply to a cabin or other structure that has no permanent power source and is supplied by a portable generator.

410-58(a) Self-Restoring Ground Pin on Portable GFCIs

Type of Change Revision

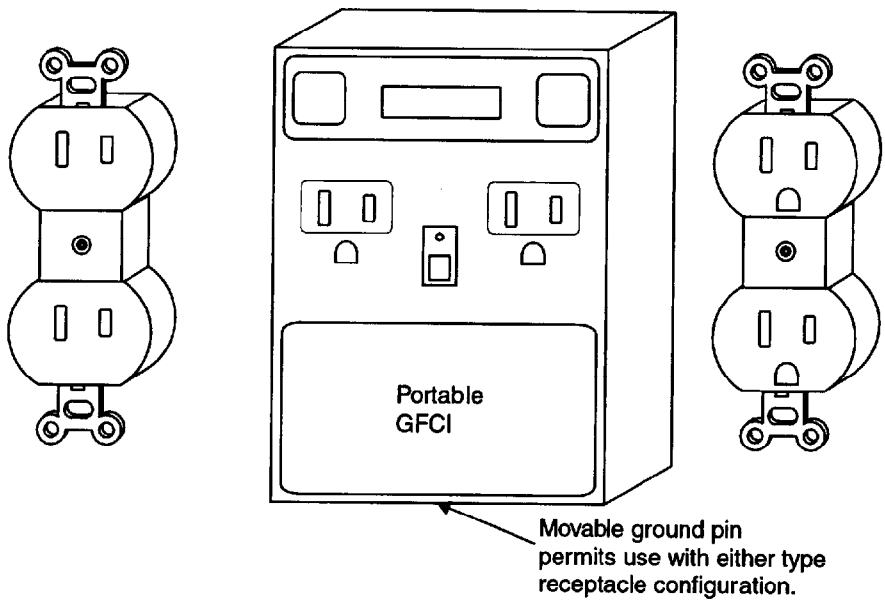
BRIEF SUMMARY

All installations. Movable, self-restoring grounding contacts are permitted on some plug-in-type GFCI devices.

Code Language

410-58. Grounding-type Receptacles, Adapters, Cord Connectors, and Attachment Plugs.

(a) Grounding Poles. Grounding-type receptacles, cord connectors, and attachment plugs shall be provided with one fixed grounding pole in addition to the circuit poles. **The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between and to conductors nor over 150 volts between any conductor and ground.** (ROP 18-74)



Self-Restoring Ground on Portable GFCI

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:40 2005

Application

The device referred to in this change is a portable 3-wire GFCI protective device that can be plugged into either a 2-wire or 3-wire receptacle. The ground prong can be moved out of the way to insert into a 2-wire receptacle but restores itself for the next use.

Background and Explanation

The 1993 and earlier codes contained an exception to Section 410-58(a) that permitted the use of a movable self-restoring grounding contact on portable hand tools. That exception was deleted from the 1996 code on the grounds that "such products are no longer available." This change restores the permission to use a similar type of attachment plug on portable GFCI devices. Such portable GFCI devices can be easily applied with both grounding and nongrounding type receptacles without having to make field modifications.

Wed Feb 02 02:31:41 2005

410-67(c) Reduction of Minimum Length for Fixture Tap Conductor

Type of Change Revision

BRIEF SUMMARY

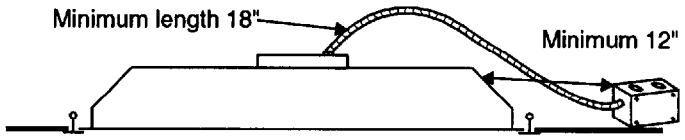
All occupancies. The minimum length of fixture tap conductors has been reduced.

Code Language

410-67. Wiring.

•
•
•

(c) Tap Conductors. Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the fixture terminal connection to an outlet box placed at least 1 ft (305 mm) from the fixture. Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least ~~4 ft.(1.22m)~~ **18 in.** (450 mm) but not more than 6 ft (1.83 m) in length. (ROP 18-78)



Minimum Tap Conductor Length

Application

The code permits unsupported raceways and certain cable assemblies in lengths not less than 18 inches and not more than 6 feet to contain tap conductors run from an outlet to the fixture connection point. This set of rules applies to fixture tap conductors installed from the outlet to the fixture. Conductors that are the same size as the branch-circuit conductors are not covered by this requirement.

Background and Explanation

The 1996 NEC permittted the tap to be run to a box at least 1 foot from the fixture. The minimum length for the tap conductor raceway was 4 feet.

Where a box is one foot from the fixture, the 1996 requirement for a minimum length of 4 feet results in an excessive amount of raceway and conductor. The extra raceway and conductor could possibly come in contact with the hot fixture surfaces and result in conductor damage.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:41 2005

NEC pp. 236–241

Article 422 Reorganization of Entire Article

Type of Change Reorganization

BRIEF SUMMARY

All installations. Article 422 has been reorganized and renumbered.

Code Language

See accompanying table.

Application

Article 422 covers electric appliances used in any occupancy. The old and new locations and numbers of the various sections of Article 422 are given in the table. The new Section 422-15, "Central Vacuum Outlet Assemblies," is covered separately in this book. Otherwise, the reorganization does not significantly alter the requirements for appliances.

Background and Explanation

This change was intended to be primarily editorial. Sections 422-6 and 422-22(d) were deleted. Section 422-22(d) was more properly covered in Section 410-56; and Section 422-6 (1996 NEC), requiring all appliances to be installed in an approved manner, was redundant. The reorganization groups sections by subject matter more accurately. Although Article 422 contained similar parts under the 1996 code, the sections were not as well grouped within the parts as they are in the 1999 version.

422-15 Central Vacuum Cleaner Outlets

Type of Change New

BRIEF SUMMARY

Residential. New requirements for central vacuum outlet assemblies have been provided.

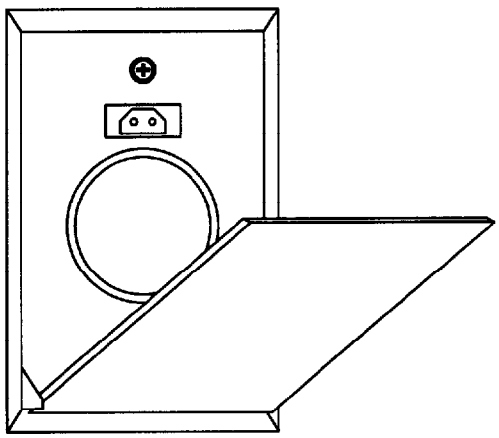
Code Language

422-15. Central Vacuum Outlet Assemblies.

(a) Listed central vacuum outlet assemblies shall be permitted to be connected to a branch circuit in accordance with Section 210-23(a).

(b) The ampacity of the connecting conductors shall not be less than the ampacity of the branch-circuit conductors to which they are connected.

(c) An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible noncurrent-carrying metal parts. (ROP 20-51)



Central vacuum outlet with 120-volt power for attachments

Centeral Vacuum Outlet Assembly

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:41 2005

Application

Some central vacuum systems use an outlet that includes a receptacle to provide power to a power head. Power to the vacuum system power head is supplied through a cord connection at the vacuum outlet by a molded multipin polarized cord cap or through conductors that are integral with the hose. A separate receptacle outlet at the suction outlet is not necessary with this new type of power outlet. These outlets contain a wiring compartment for the connection of the power supply conductors.

Background and Explanation

This new section allows devices of this type to be connected to 15- or 20-ampere general purpose branch circuits that are located in the area where the vacuum outlet is to be installed. The control circuit that initiates the operation of the central vacuum unit is typically a Class 2 circuit supplied by the unit.

422-16 (b)(1) & (2) Cords Identified by Installation Instructions for Specific Appliances

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Restrictions have been added and clarified on the use of cords with dishwashers, compactors, and waste disposers.

Code Language

422-16. Flexible Cords.

•
•
•

(b) Specific Appliances.

(1) Electrically operated kitchen waste disposers shall be permitted to be cord- and plug-connected with a flexible cord identified **as suitable for the purpose in the installation instructions of the appliance manufacturer**, where all of the following conditions are met.

(a) The flexible cord shall be terminated with a grounding type attachment plug.

Exception: A listed kitchen disposer distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be ***terminated with a grounding-type attachment plug.*** (ROC 20-14)

(b) The length of the cord shall not be less than 18 in. (457 mm) and not over 36 in. (914 mm).

(c) Receptacles shall be located to avoid physical damage to the flexible cord.

(d) The receptacle shall be accessible.

(2) Built-in dishwashers and trash compactors shall be permitted to be cord- and plug-connected with a flexible cord identified **as suitable for the purpose in the installation instructions of the appliance manufacturer** where all of the following conditions are met.

(a) The flexible cord shall be terminated with a grounding-type attachment plug.

Exception: A listed dishwasher or trash compactor distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be ***terminated with a grounding-type attachment plug.*** (ROC 20-14)

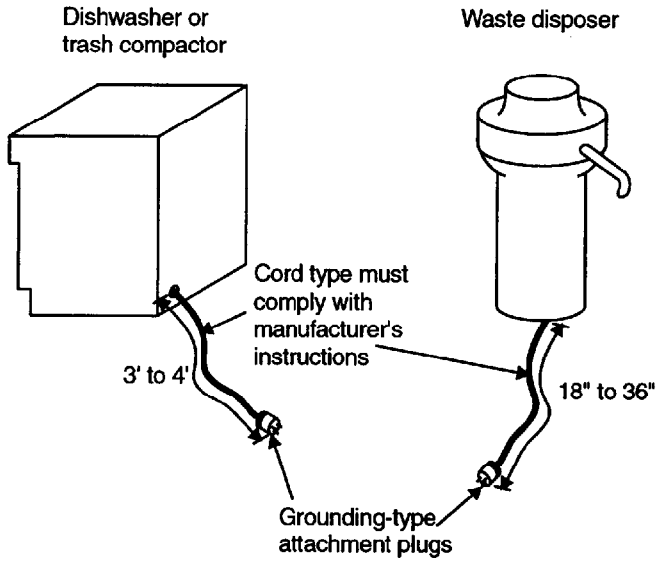
(b) The length of the cord shall be 3 ft to 4 ft (0.914 m to 1.22 m) **measured from the face of the attachment plug to the plane of the rear of the appliance.**

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:42 2005

(c) Receptacles shall be located to avoid physical damage to the flexible cord.

(d) The receptacle shall be located in the space occupied by the appliance or adjacent thereto.

(e) The receptacle shall be accessible.



Cords on Kitchen Appliances

Application

Three changes were made that restrict or clarify the use of flexible cords with dishwashers, trash compactors, or waste disposers: (1) Cords must be identified as suitable for the purpose in the manufacturers instructions, (2) Cords must have a grounding-type attachment plug unless the appliance is double insulated; and (3) The cord length for a dishwasher or compactor is measured from the plane of the rear of the appliance to the face of the attachment plug.

Background and Explanation

This change was meant to clarify the existing requirements and deletes some of the exceptions by rewriting them into positive code language. It also clarifies that the identification of suitable cords is to be done by consulting the manufacturer's literature, not by looking for some mention of the appliance type on the cords. In addition, the change specifies the points of measurement for cords for dishwashers and compactors. This specification allows for only the part of the cord external to the appliance to be counted. Thus, somewhat longer cords may be used to get to the necessary connection points within the appliances.

424-44(g) GFCI Protection for Embedded Floor Heating Elements

Type of Change New

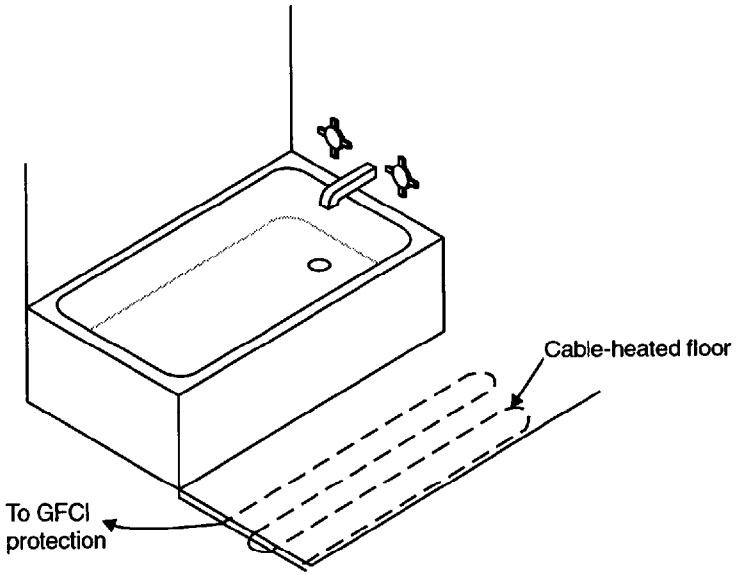
BRIEF SUMMARY

Residential and commercial. GFCI protection is required for some electrically heated floors.

Code Language

424-44. Installation of Cables in Concrete or Poured Masonry Floors.

(g) Ground-Fault Circuit-Interrupter Protection for Conductive Heated Floors of Bathrooms, Hydromassage Bathtub, Spa, and Hot Tub Locations. Ground-fault circuit-interrupter protection for personnel shall be provided for electrically heated floors in bathrooms, hydromassage bathtub, spa, and hot tub locations. This shall apply to all systems used with conductive floor coverings, whether cable, panel, or other approved types. (ROP 20-69) (ROC 20-74, 20-80, 20-82)



GFCI Protection for Bathroom Floor Heating

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:42 2005

Application

Electric floor heating cable systems are installed in some bathrooms. These systems may also be installed where spas, hot tubs, or hydromassage bathtubs are installed in locations not defined as bathrooms. Where such heating systems are installed, ground-fault circuit-interrupter protection must be provided. This will reduce the shock hazard that may exist for someone stepping out of the tub onto the conductive floor.

Background and Explanation

As the floor structure ages, cracks may develop due to flexing of the floor. This flexing and cracking may cause damage in the heating cable system that results in leakage current. The use of the GFCI protection will serve to reduce shock hazards to persons with bare feet in these areas.

426-28 GFPE for Snow-Melting Equipment

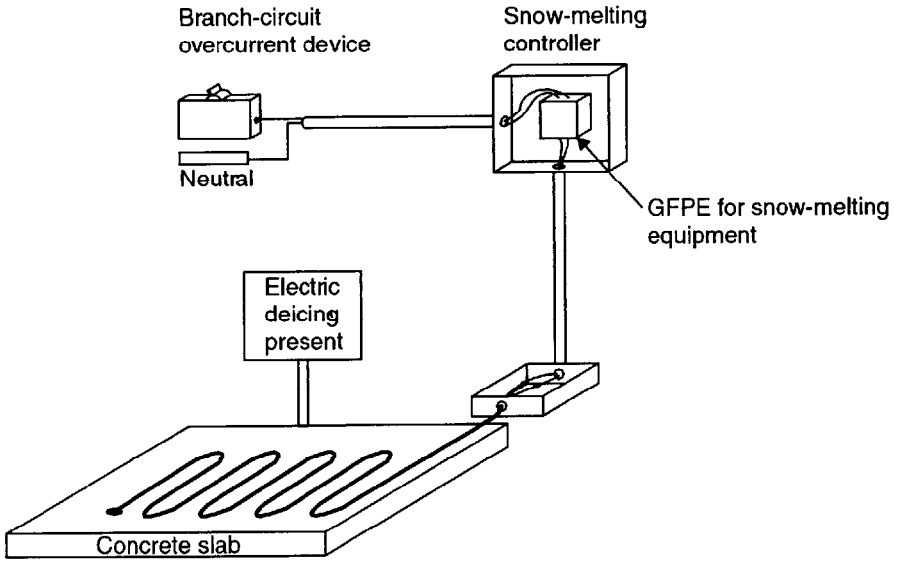
Type of Change Revision

BRIEF SUMMARY

All installations. Ground-fault protection for fixed outdoor electric deicing and snow-melting equipment must protect the equipment but need not protect the entire branch circuit. Some embedded mineral-insulated cables are exempted.

Code Language

426-28. Equipment Protection. Ground-fault protection of equipment shall be provided for **fixed outdoor electric deicing and snow-melting equipment, except for equipment that employs mineral-insulated, metal-sheathed cable in a noncombustible medium.** (ROP 12-7, 12-8) (ROC 12-3)



GFPE for Deicing and Snow-Melting

Application

The illustration shows an installation of embedded electric deicing equipment with ground-fault protection for equipment (GFPE) provided. A separate ground-fault equipment protection circuit-interrupter (GFEPCI) device is shown. The entire branch circuit is not required to be protected, so an ordinary circuit breaker is shown as the branch-circuit overcurrent device. Ground-fault

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:43 2005

equipment protection is required for all fixed outdoor electric deicing and snow-melting equipment except for equipment that employs mineral-insulated metal-sheathed cables installed in a noncombustible medium.

Background and Explanation

Not all manufacturers make circuit breakers with GFPE in all ampere and voltage ratings. Supplementary devices may be necessary to avoid changing the branch-circuit distribution panels. This change makes it clear that the GFPE requirement is for the equipment and not for the branch circuit. There are electric deicing and snow-melting units that have an integral GFPE as part of the listed assembly. Such units will comply with the revised wording of this section. GFEPCI devices are designed for equipment protection at leakage current levels between 6mA and 50mA.

New wording also provides an exemption for mineral-insulated metal-sheathed cable used for deicing or snow-melting if it is embedded in a noncombustible medium such as the concrete slab in the illustration. Such cable is much less susceptible to the arcing ground faults that have occurred with other cable types.

427-22 GFPE for Heat Tracing and Heating Panels

Type of Change Revision

BRIEF SUMMARY

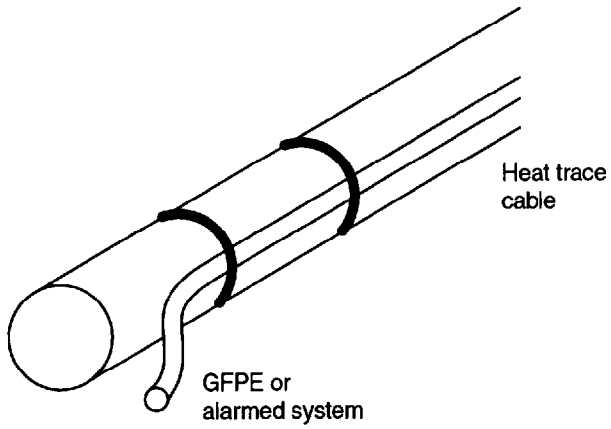
Industrial. The requirements for ground-fault protection of equipment has been clarified.

Code Language

427-22. Equipment Protection. Ground-fault protection of equipment shall be provided for ~~each branch circuit supplying electric heating equipment~~ **electric heat tracing and heating panels.** This requirement shall not apply in industrial establishments where there is alarm indication of ground faults and (ROC 12-10)

(1) Conditions of maintenance and supervision ensure that only qualified persons will service the installed systems.

(2) Continued circuit operation is necessary for safe operation of equipment or processes. (ROP 12-25, 12-26)(ROC 12-9)



Protection for Heat Tracing and Heating Panels

Application

As revised, this section requires GFPE for heat tracing and heating panels only and not for the branch circuit supplying the equipment. Such protection is not required in industrial establishments where alarms are installed to indicate a ground-fault condition and the conditions specified in (1) and (2) are met.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:43 2005

Background and Explanation

The 1996 code required protection of the branch circuit and the heating equipment. The intent was to protect the equipment, not the entire circuit. This revision clarifies that intent. In addition, the 1996 code required ground-fault protection for all equipment related to resistance heating elements for pipelines and vessels. The revision to the 1999 code also makes it clear that heat tracing and heating panels are the only types of equipment requiring GFPE. The exception for industrial facilities has been integrated as part of the main rule.

Wed Feb 02 02:31:43 2005

430-6(a)(1) Exc. No. 3 HP and Motor-Operated Appliances

Type of Change Revision

BRIEF SUMMARY

All installations. The ampere rating on the nameplate of an appliance shall be used instead of a marked horsepower rating for sizing conductors and other circuit components.

Code Language

430-6. Ampacity and Motor Rating Determination.

(a) General Motor Applications. For general motor applications, current ratings shall be determined based on (1) and (2).

(1) Table Values. The values given in Tables 430-147, 430-148, 430-149, and 430-150, including notes, shall be used to determine the ampacity of conductors or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection, instead of the actual current rating marked on the motor nameplate. Where a motor is marked in amperes, but not horsepower, the horsepower rating shall be assumed to be that corresponding to the value given in Tables 430-147, 430-148, 430-149, and 430-150, interpolated if necessary.

•
•
•

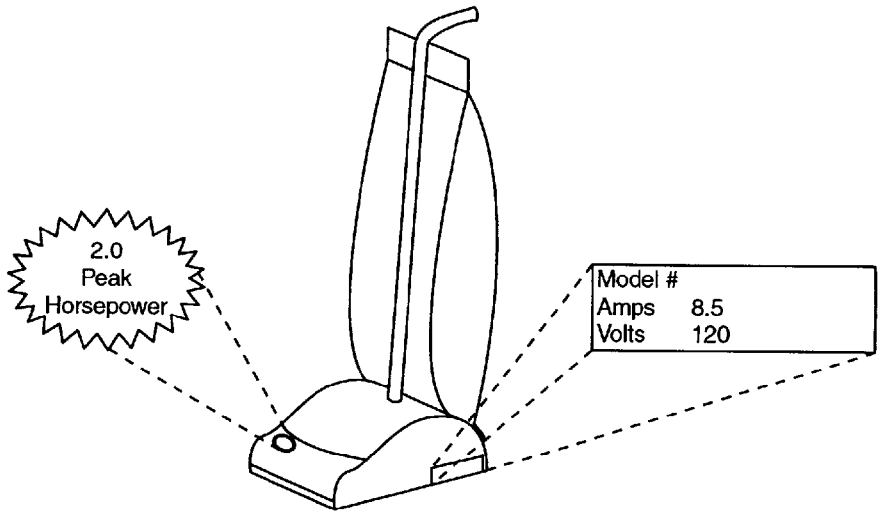
Exception No. 3: For a listed motor-operated appliance that is marked with both motor horsepower and full-load current, the motor full-load current marked on the nameplate of the appliance shall be used instead of the horsepower rating on the appliance nameplate to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and any separate overload protection. (ROP 11-10) (ROC 11-8)

Application

Some appliances have both horsepower and current ratings on their nameplates. When applying the provisions of Article 430 for sizing conductors, disconnecting means, controllers, and so on, the current rating of the appliance shall be used rather than the horsepower rating. For example, the illustration is based on an ac-

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:44 2005

tual appliance. The current rating is approximately equivalent to a ½ HP motor and is equipped with an 18/2 cord with a 15-ampere-rated attachment plug. Based on the nameplate current rating of 8.5 amps, the appliance can be connected to a 15- or 20-ampere branch circuit. This meets the requirements of Sections 210-23(a), 430-22, 430-32(b), 430-53(a), and 430-109(f), as well as the applicable provisions of Article 422.



Use of Appliance Horsepower Markings

Background and Explanation

This change was meant to resolve the confusion that results when motor-operated appliances are labeled with horsepower as well as ampere ratings. In the example given in the illustration, if the 2 HP rating were an actual horsepower rating, the appliance would require a 30-ampere-rated circuit (based on the full load current of 24 amperes for a 115-volt, 2HP motor from Table 430-148) with No. 12 or No. 10 wire, and it could not be supplied from a 15- or 20-ampere-rated circuit. The current rating of the appliance is more meaningful and accurate in such cases and is subject to closer scrutiny by the testing laboratories than the marked horsepower rating.

Wed Feb 02 02:31:44 2005

430-40 Exc. Protection of Overload Devices

Type of Change Revision

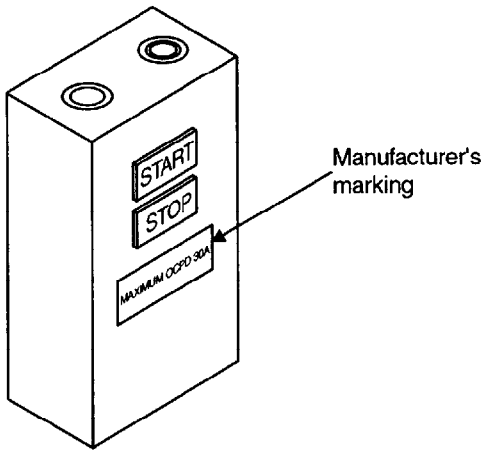
BRIEF SUMMARY

All occupancies. Overload relays are permitted to be protected in accordance with their markings.

Code Language

430-40. Overload Relays. Overload relays and other devices for motor overload protection that are not capable of opening short circuits shall be protected by fuses or circuit breakers with ratings or settings in accordance with Section 430-52 or by a motor short-circuit protector in accordance with Section 430-52.

Exception: Where approved for group installation and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they must be protected, ***the overload devices shall be protected in accordance with this marking.*** (ROP 11-43)(ROC 11-20)



Overload Relays Protected per Manufacturer's Marking

Application

Overload relays may be marked to indicate a maximum overcurrent protection rating. If marked, the relay must be protected by overcurrent devices not in excess of the marked rating.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:44 2005

Background and Explanation

The new wording in the exception clarifies that overloads for multiple-motor (group installation) type equipment are to be protected by a short-circuit device sized in accordance with the value marked on the equipment by the manufacturer.

Wed Feb 02 02:31:44 2005

430-52(c)(6) Self-Protected Combination Controllers

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Listed self-protected combination starters may be used to provide short-circuit and ground-fault protection in motor circuits.

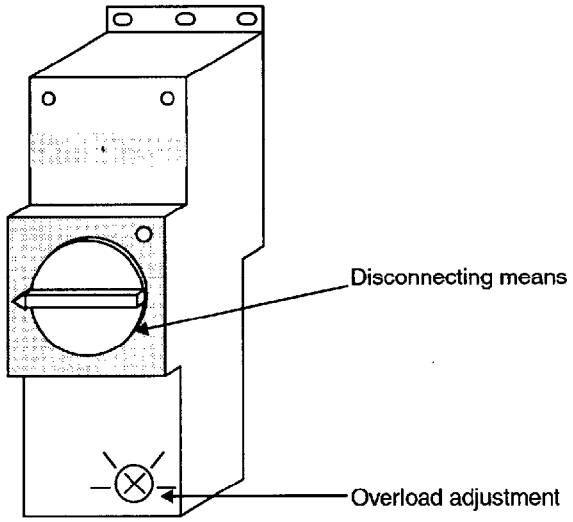
Code Language

430-52. Rating or Setting for Individual Motor Circuit.

(a) General. The motor branch-circuit short-circuit and ground-fault protective device shall comply with (b) and either (c) or (d), as applicable.

(c) Rating or Setting.

(6) A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 430-152. Adjustable instantaneous-trip settings shall not exceed 1300 percent of full-load motor current for other than Design E motors or Design B energy efficient motors and not more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors. (ROP 11-55) (ROC 11-35)



Listed combination controller with integral SCGF protection

Self-Protected Combination Controllers

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:44 2005

Application

Self-protected combination controllers can combine the functions of a disconnect, short-circuit, ground-fault protection device, an overload relay, and a contactor into a single device. The illustration shows a self-protected controller. This device uses replaceable modules. The modules have separate protection components. One adjustment provides overload protection. A separate adjustable magnetic trip unit provides short-circuit and ground-fault protection. A set of contacts functions as a controller. In fact, in this case, a single set of contacts functions as controller, circuit breaker, and disconnect. The same set of contacts are controlled by the magnetic trip unit, the overload trip unit, external control devices, and by the manual operating knob. The operating knob is capable of being locked in the off position for maintenance.

Background and Explanation

Although self-protected combination starters have been available as products listed under a special category of UL508, only the overload and controller functions have been recognized by the language of previous codes. The list of devices suitable for short-circuit and ground-fault protection has previously included only fuses, circuit breakers, and motor circuit protectors. This change recognizes the use of self-protected controllers as short-circuit and ground-fault protective devices. Section 430-52(c)(6) provides maximum settings for the adjustable instantaneous trip settings. A separate proposal was accepted to modify Section 430-109 (see Section 430-109(a)(5)) to recognize these devices as disconnecting means.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:44 2005

430-52(c) (6) & (7) High Efficiency Design B Motors

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The selection of motor short-circuit and ground-fault protective devices has been clarified.

Code Language

430-52. Rating or Setting for Individual Motor Circuit.

•
•
•

(c) Rating or Setting.

(6) A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 430-152. Adjustable instantaneous-trip settings shall not exceed 1300 percent of full-load motor current for other than Design E motors or Design B energy efficient motors and not more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors. (ROP 11-55) (ROC 11-35)

(7) A motor short-circuit protector shall be permitted in lieu of devices listed in Table 430-152 if the motor short-circuit protector is part of a listed combination motor controller having coordinated motor overload protection and short-circuit and ground-fault protection in each conductor and it will open the circuit at currents exceeding 1300 percent of motor full-load current for other than Design E motors or Design B energy efficient motors and 1700 percent of motor full-load motor current for Design E motors or Design B energy efficient motors.

(ROP 11-54) (ROC 11-36)(TCC 11-53)

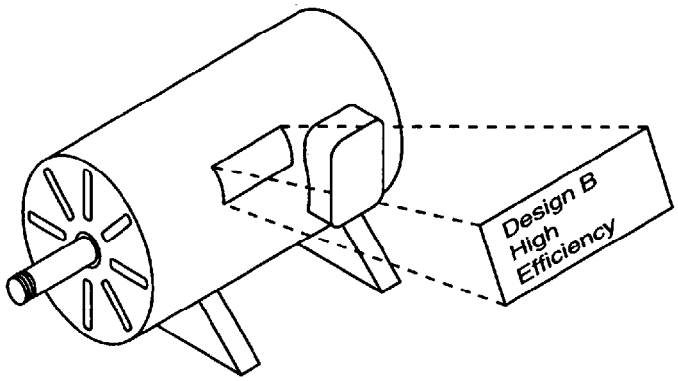
Application

Sections 430-52(c)(6) and (7) now treat energy efficient design B motors the same as Design E motors relative to maximum settings of short-circuit, ground-fault protection devices.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:45 2005

Section 430-52(c)(7) was relocated from Section 430-52(c)(3) to separate the requirements for motor short-circuit protectors from those for instantaneous-trip circuit breakers.

Section 430-52(c)(3) requires an instantaneous-trip breaker to be selected based on Table 430-152. The exception allows the size to be increased only if the need has been demonstrated. Sections 430-52(c)(6) and(c)(7) do not require the use of Table 430-152 and do not require the demonstration of need when the size is selected.



Energy Efficient Design B Motor Protection

Background and Explanation

Instantaneous-trip circuit breakers and motor short-circuit protectors are not interchangeable terms and are separate types of protective devices that have maximum settings unique to each type of device. The changes to these two sections recognize that energy efficient Design B motors have locked rotor currents equivalent to Design E motors.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:45 2005

430-102(a) & Exc. No. 2 Controller Provided with Individual Disconnect

Type of Change Revision

BRIEF SUMMARY

All occupancies. The requirements for disconnects at motor controllers have been clarified.

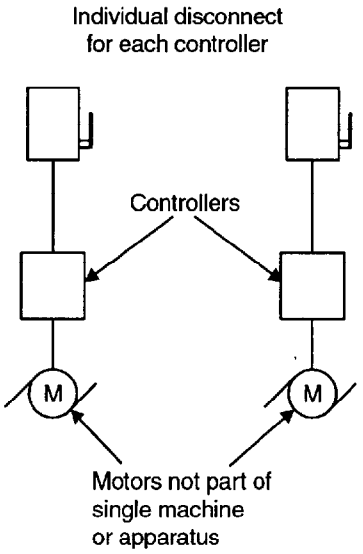
Code Language

430-102. Location.

(a) Controller. An **individual** disconnecting means shall be **provided for each controller** and shall disconnect the controller. The disconnecting means shall be located in sight from the controller location. (ROP 8-81, 8-82) (ROC 11-52)

Exception No. 1: For motor circuits over 600 volts, nominal, a controller disconnecting means capable of being locked in the open position shall be permitted to be out of sight of the controller, provided the controller is marked with a warning label giving the location of the disconnecting means.

Exception No. 2: A single disconnecting means shall be permitted for a group of coordinated controllers ***that drive several parts of a single machine or piece of apparatus. The disconnecting means and the controllers shall be located in sight from the machine or apparatus.*** (ROP 11-82)



Individual Disconnecting Means for Each Controller

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:45 2005

Application

In motor applications an individual disconnect is required to be installed within sight of each motor controller. Exception No. 2 allows the use of a single disconnect for a group of coordinated controllers that drive a single machine or apparatus.

Background and Explanation

The revised wording is intended to clarify to what type of machine the exception applies. The requirement for individual disconnects was not clear in the 1996 NEC. Exception No. 2 applied to a multimotor continuous process machine. There were many different interpretations of the meaning of "continuous process machine." These words were replaced with "a single machine or piece of apparatus" to clarify that it does not apply only to a continuous process machine.

Wed Feb 02 02:31:45 2005

430-102(b) Exc. Disconnect at Motor Not Required

Type of Change Revision

BRIEF SUMMARY

All installations. The rule that allows the omission of a disconnect at a motor when the disconnect at the controller is lockable has been clarified.

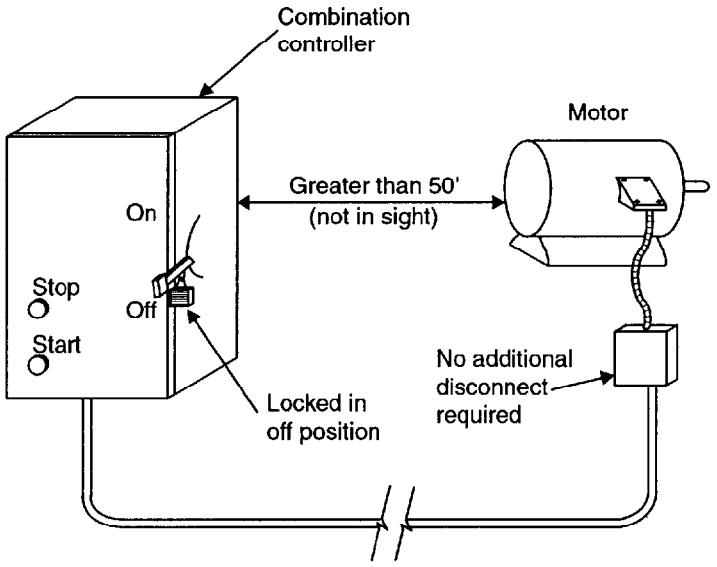
Code Language

430-102. Location.

•
•
•

(b) Motor. A separate disconnecting means shall be located in sight from the motor location and the driven machinery location.

Exception: A disconnecting means, ***in addition to the controller disconnecting means as required*** *in accordance with Section 430-102(a),* ***shall not be required for the motor*** *where the disconnecting means* ***for the controller*** *is individually capable of being locked in the open position.* (ROP 11-92) (ROC 11-61)



Disconnects for Motors

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:46 2005

Application

Where the controller for a motor has a disconnect located in sight from the controller and the controller disconnect is capable of being locked in the off position, no additional disconnect is required at the motor or between the controller and the motor. The illustration shows an example of a lockable disconnect at the controller with no additional disconnect for the motor. "In sight from" means visible and not more than 50 feet away, according to the definition in Article 100.

Background and Explanation

This change is intended as a clarification. The intent of the rule was not changed.

The basic rule of Section 430-102 requires disconnects in sight from both a motor and controller. Section 430-102 does not require two separate disconnects if one disconnect can be located in sight of both the controller and motor. A controller and disconnect mounted adjacent to each other and within sight (as defined in Article 100) of the controlled motor comply with the requirements of both Sections 430-102(a) and (b). For example, if the controller in the illustration were located in sight from the motor, the disconnect for the controller could also serve as the disconnect for the motor, even if the disconnect were not lockable. The NEC does not require lockable disconnects as required under OSHA regulations.

Interpretations of the previous wording of this exception varied widely. Some interpretations allowed the motor disconnect to be out of sight of the motor but still required it to be located somewhere between the controller and motor in the circuit. Another interpretation incorporated Exception No. 1 under Section 430-102(a) into the rule and allowed the motor disconnect to be remote from the motor only when the motor was rated over 600 volts. The revised wording makes the rule clear in allowing the omission of the disconnect at the motor when the disconnect at the controller can be locked in the open (off) position.

Wed Feb 02 02:31:46 2005

430-109(a)(6) & (c)(3) Marked Manual Motor Starter as Disconnecting Means

Type of Change Revision

BRIEF SUMMARY

All occupancies. Some manual motor controllers are permitted to be used as both the controller and disconnect.

Code Language

430-109. Type. The disconnecting means shall be a type specified in (a), unless otherwise permitted in (b) through (g), under the conditions specified. (ROP 11-98) (ROC 11-64)

(a) General.

•
•
•

(6) Listed manual motor controllers additionally marked "Suitable as Motor Disconnect" shall be permitted as a disconnecting means where installed between the final motor branch-circuit short-circuit and ground-fault protective device and the motor. (ROP 11-98, 11-100)

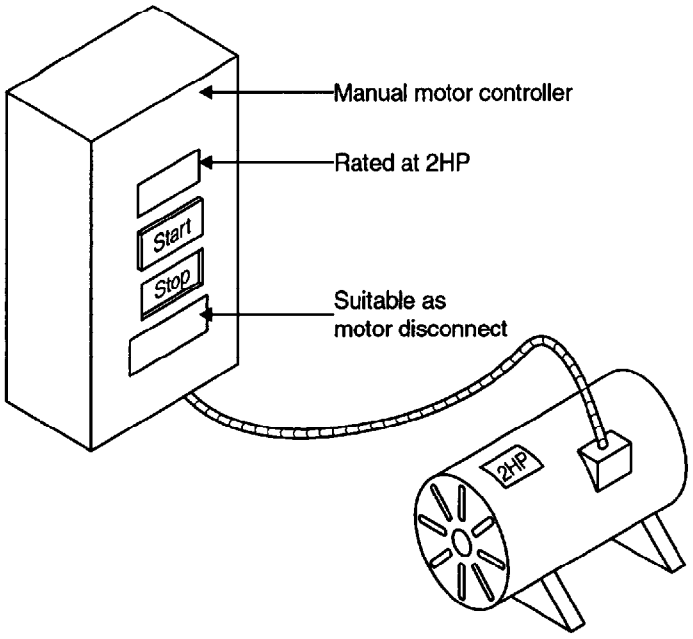
•
•
•

(c) Stationary Motors of 2 Horsepower or Less. For stationary motors rated at 2 hp or less and 300 volts or less, the disconnecting means shall be permitted to be one of the devices specified in (1), or (2), or (3).

•
•
•

(3) A listed manual motor controller having a horsepower rating not less than the rating of the motor and marked "Suitable as Motor Disconnect." (ROC 11-63)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:46 2005



Manual Motor Controller Permitted as Motor Disconnect

Application

For general motor installations, Section 430-109(a)(6) allows manual motor controllers to serve as the disconnect. The controller must be marked as suitable for the use and be located between the short-circuit, ground-fault device and the motor.

For motors 2 HP or less rated 300 volts or less, Section 430-109(c)(3) allows the use of a manual motor controller as the disconnect. In this case the disconnect must also be marked as suitable for the use.

Background and Explanation

The entire section was totally revised to change the exceptions into positive code language. The recognition of manual motor controllers marked as "suitable as motor disconnect" was also added. There are manual motor controllers that are not provided with this marking and thus are not permitted to be used as a motor disconnecting means.

Section 430-110(a) Exc. Nonfused Motor Disconnects

Type of Change New

BRIEF SUMMARY

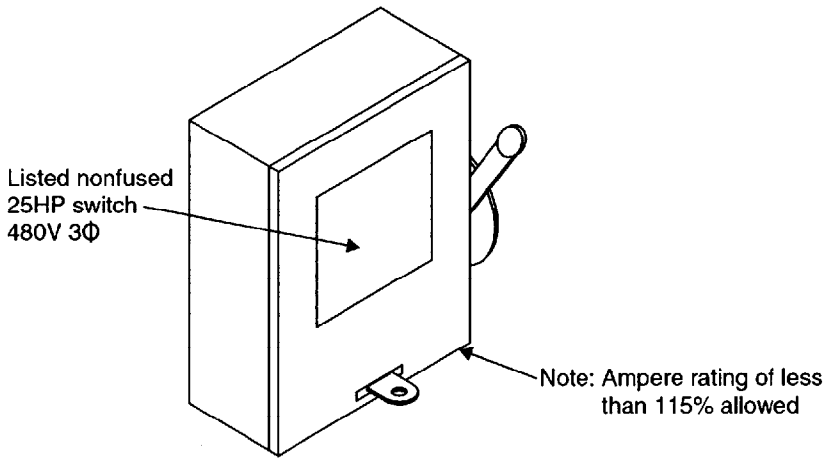
All occupancies. The requirement for selection of nonfused disconnects for use in motor circuits has been revised.

Code Language

430-110. Ampere Rating and Interrupting Capacity.

(a) General. The disconnecting means for motor circuits rated 600 volts, nominal, or less, shall have an ampere rating of at least 115 percent of the full-load current rating of the motor.

Exception: A listed nonfused motor-circuit switch having a horsepower rating equal to or greater than the motor horsepower shall be permitted to have an ampere rating less than 115 percent of the full-load current rating of the motor. (ROP 11-109)(ROC 11-70)



Listed Nonfused Switch with HP Rating

Application

It is common practice to install a nonfused disconnect in sight from a motor to comply with Section 430-102(b). In applications of this type, the nonfused switch may be selected based on the HP rating marked on the listed switch. It is not necessary to verify compliance with the 115 percent sizing requirement contained in the main rule of Section 430-110(a).

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:46 2005

Background and Explanation

An HP-rated nonfused switch may not have an ampere rating of 115 percent of the full load current rating of the motor. However, switches of this type have undergone temperature testing at 115 percent of the motor full load currents from Tables 430-148 through 430-150 and are now permitted to serve as a motor-circuit disconnecting means. This revision is intended to eliminate enforcement problems where a nonfused HP-rated switch is used in a motor circuit.

NEC pp. 291–292

450-3 Transformer Overcurrent Protection Rules

Type of Change Revision

BRIEF SUMMARY

All installations. The rules for overcurrent protection of transformers have been rearranged into tables with notes.

Code Language

450-3. Overcurrent Protection. Overcurrent protection of transformers shall comply with (a), (b), or (c). As used in this section, the word *transformer* shall mean a transformer or polyphase bank of two or more single-phase transformers operating as a unit.

FPN No. 1: See Sections 240-3, 240-21, 240-100, and 240-101 for overcurrent protection of conductors.

FPN No. 2: Nonlinear loads can increase heat in a transformer without operating its overcurrent protective device.

(a) Transformers Over 600 Volts, Nominal. Overcurrent protection shall be provided in accordance with Table 450-3(a).

(b) Transformers 600 Volts, Nominal, or Less. Overcurrent protection shall be provided in accordance with Table 450-3(b).

Exception: Where the transformer is installed as a motor-control circuit transformer in accordance with Sections 430-72(c)(1) through (5).

(c) Voltage Transformers. Voltage transformers installed indoors or enclosed shall be protected with primary fuses.

FPN: For protection of instrument circuits including voltage transformers, see Section 384-32. (ROP 13-8)

Application

As shown on the next two pages, Tables 450-3(a) and (b) provide requirements for overcurrent protection of transformers. The following procedure can be used with the new tables:

First, select the appropriate table based on the voltage rating of a transformer. For voltages over 600 volts, use Table 450-3(a). Use Table 450-3(b) for transformers rated 600 volts or less.

Second, select the conditions of use or characteristics of the transformer. Table 450-3(a) is based on the rated voltage of the transformer primary and secondary, the impedance of the transformer, and the type of location (supervised

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:47 2005

or not). Table 450-3(b) is based on the current rating of the transformer and whether only primary protection or both primary and secondary protection is provided

Third, choose a percentage multiplier from the appropriate table. Table 450-3(a) provides different percentages for circuit breakers and fuses. Use the selected percentage and the rated transformer primary and secondary currents to calculate the appropriate maximum ratings of overcurrent protective devices for the transformers.

Use the table notes at the bottom of the table to provide clarification and additional information, such as when the next standard size overcurrent device may be used.

Table 450-3(a). Maximum Rating or Setting of Overcurrent Protection for Transformers over 600 Volts (as a Percentage of Transformer-Rated Current)

		Primary Protection		*Secondary Protection (see Note 2)*		
		Over 600 Volts		*Over 600 Volts*		*600 Volts or Below*
Location Limitations	*Transformer Rated Impedance*	*Circuit Breaker (see Note 4)*	*Fuse Rating*	*Circuit Breaker (see Note 4)*	*Fuse Rating*	*Circuit Breaker or Fuse Rating*
Any location	Not more than 6%	600% (see Note 1)	300% (see Note 1)	300% (see Note 1)	250% (see Note 1)	125% (see Note 1)
	More than 6% and not more than 10%	400% (see Note 1)	300% (see Note 1)	250% (see Note 1)	225% (see Note 1)	125% (see Note 1)
Supervised locations only (see Note 3)	Any	300% (see Note 1)	250% (see Note 1)	Not required	Not required	Not required
	Not more than 6%	600%	300%	300% (see Note 5)	250% (see Note 5)	250% (see Note 5)
	More than 6% and not more than 10%	400%	300%	250% (see Note 5)	225% (see Note 5)	250% (see Note 5)

Note 1: Where the required fuse rating or circuit breaker setting does not correspond to a standard rating or setting, the next higher standard rating or setting shall be permitted.

Note 2: Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device. If both breakers and fuses are utilized as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.

Note 3: A supervised location is a location where conditions of maintenance and supervision ensure that only qualified persons will monitor and service the transformer installation.

Note 4: Electronically actuated fuses that may be set to open at a specific current shall be set in accordance with settings for circuit breakers. (ROP 13-8)

Note 5: A transformer equipped with a coordinated thermal overload protection by the manufacturer shall be permitted to have separate secondary protection omitted. (ROC 13-3)

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:47 2005

Table 450-3(b). Maximum Rating or Setting of Overcurrent Protection for Transformers 600 Volts and Less (as a Percentage of Transformer-Rated Current)

	Primary Protection			*Secondary Protection (see Note 2)*	
Protection Method	*Currents of 9 Amperes or more*	*Currents less than 9 Amperes*	*Currents less than 2 Amperes*	*Currents of 9 Amperes or more*	*Currents less than 9 Amperes*
Primary only protection	125% (see Note 1)	167%	300%	Not required	Not required
Primary and secondary protection	250% (see Note 3)	250% (see Note 3)	250% (see Note 3)	125% (see Note 1)	167%

Note 1: Where 125 percent of this current does not correspond to a standard rating of a fuse or nonadjustable circuit breaker, the next higher standard rating described in Section 240-6 shall be permitted.

Note 2: Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed that allowed value of a single overcurrent device. If both breakers and fuses are utilized as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.

Note 3: A transformer equipped with coordinated thermal overload protection by the manufacturer and arranged to interrupt the primary current, shall be permitted to have primary overcurrent protection rated or set at a current value that is not more than six times the rated current of the transformer for transformers having not more than 6 percent impedance, and not more than four times the rated current of the transformer for transformers having more than 6 percent but not more than 10 percent impedance.

Background and Explanation

The requirements of this section have not been changed from the 1996 code. This change was intended to make the selection of overcurrent protection for transformers easier by grouping all of the requirements into two tables with simplified notes.

450-13(b) Transformers in Hollow Spaces of Buildings

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Transformers up to 50kVA can be installed in an accessible hollow space.

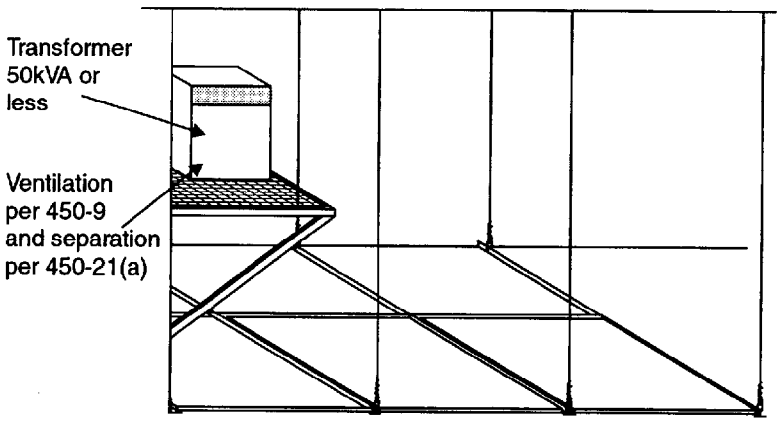
Code Language

450-13. Accessibility. All transformers and transformer vaults shall be readily accessible to qualified personnel for inspection and maintenance, or meet the requirements of (a) or (b).

(a) Open Installations. Dry-type transformers 600 volts, nominal, or less, located in the open on walls, columns, or structures, shall not be required to be readily accessible.

(b) Hollow Space Installations. Dry-type transformers 600 volts, nominal, or less and not exceeding 50kVA shall be permitted in ~~fire-resistant~~ hollow spaces of buildings not permanently closed in by structure, and provided they meet the ventilation requirements of Section 450-9 **and separation from combustible materials requirements of Section 450-21(a).** Transformers so installed shall not be required to be readily accessible.

(ROP 13-17)(ROC 13-10, 13-11)



Transformer in Accessible Hollow Space Above Ceiling

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:47 2005

Application

Transformers up to 50kVA can be installed in hollow spaces of buildings such as the accessible space above a suspended ceiling. Adequate ventilation in accordance with Section 430-9 must be provided and separation from combustible material is required. Section 110-26 also requires adequate workspace for all electrical equipment and would apply to an installation of this type.

Background and Explanation

The 1996 NEC required hollow spaces to have a 1-hour fire rating. Individual hollow spaces are not fire rated. Even with a fire-rated floor-ceiling assembly the entire assembly was rated but not the hollow space alone.

This revision provides a practical approach to locating dry-type transformers rated 50kVA or less within the hollow spaces of a building.

480-8(c) Working Clearances in Battery Rooms

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Clearances in battery rooms must comply with Section 110-26.

Code Language

480-8. Battery Locations.

•
•
•

(c) Working Space. Working space about the battery systems shall comply with Section 110-26. Working clearance shall be measured from the edge of the battery rack. (ROP 15-17)(ROC 15-14a) (TCC 15-14a)

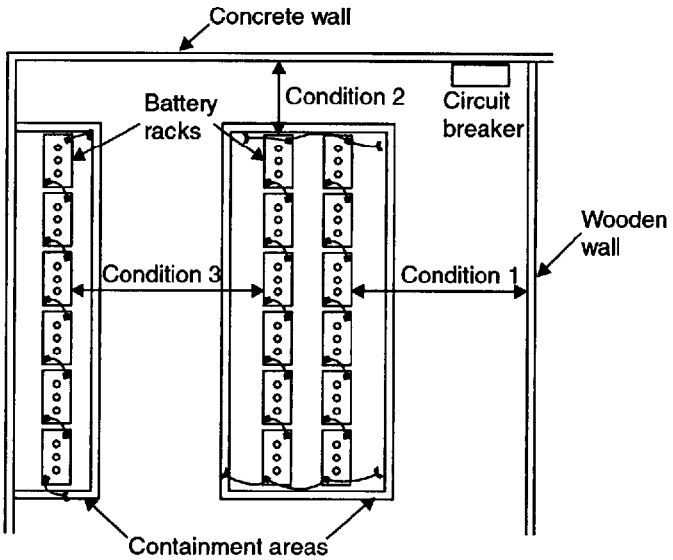

Table 110-26(a) clearances required

Battery Room Clearances

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:48 2005

Application

The illustration shows a plan view of a battery room layout. Clearances must be maintained in accordance with Section 110-26. The output voltage of the battery system shall be used in selecting the appropriate clearances from Table 110-26(a). Measurements are to be taken from the battery racks as shown. The illustration shows the three conditions from Table 110-26(a) applied to a storage battery installation. The specific distances will be determined based on the system voltage to ground.

Background and Explanation

Battery installations usually require routine maintenance. Clearances have not been specifically mentioned in Article 480 in previous codes. Although some authorities would have required the clearances of Section 110-26 anyway, others have argued that batteries don't fall under the general category of electrical equipment. This change clarifies the applicability of the work space requirements by making a specific reference to Section 110-26.

Article 490 Equipment Over 600 Volts

Type of Change New

BRIEF SUMMARY

Commercial and industrial. A new Article 490 covers the general requirements for equipment operating at over 600 volts.

Code Language

A. General

490-1. Scope. This article covers the general requirements for equipment operating at more than 600 volts, nominal.

FPN: See *Standard for Electrical Safety Requirements for Employee Workplaces,* NFPA 70E-1995, for electrical safety requirements for employee workplaces.

490-2. Definition. For the purposes of this article, *high voltage* shall be defined as more than 600 volts, nominal.

Application

This new article includes much of the material in the deleted Article 710 of the 1996 NEC. The origin and destination of the sections making up the new Article 490 are shown in the accompanying diagram.

Background and Explanation

Article 710 was an article covering systems of over 600 volts that combined rules on equipment, installation, wiring methods, and overcurrent protection. Since equipment over 600 volts is common, particulary in the industrial environment, the location of these requirements in Chapter 7 ("Special Conditions") was not appropriate. The new Article 490 is located in Chapter 4, "Equipment for General Use." The rules applicable to the equipment itself were relocated to the new Article 490. Other rules were relocated to Articles 110, 240, and 300. Those changes are covered separately.

500-3(b) Documentation of Area Classification Scheme

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Hazardous areas must be documented and the documentation available to those responsible for design, maintenance, installation, inspection, or operation of equipment in the areas.

Code Language

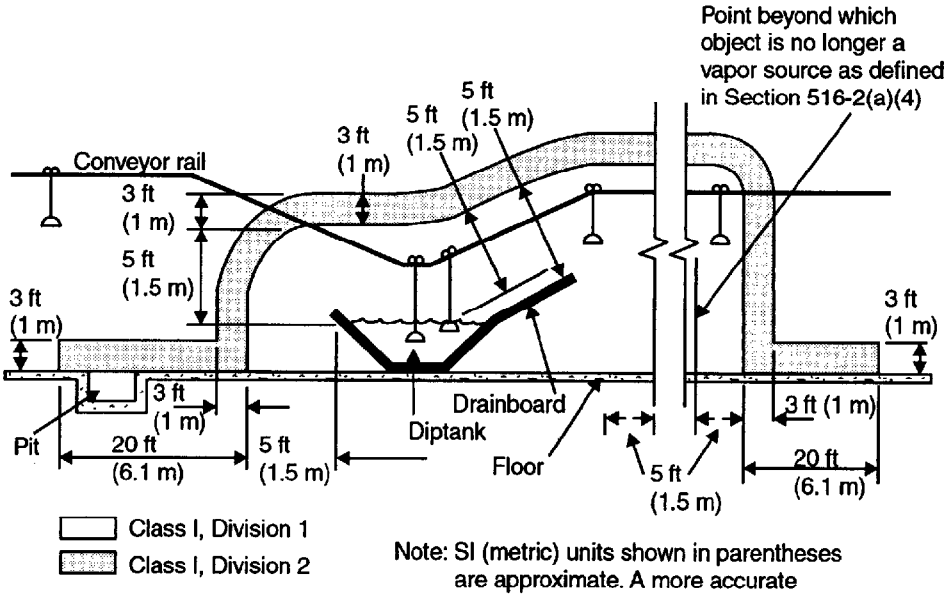
500-3. General.

•

•

•

(b) Documentation. All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location. (ROP 14-8, 14-15)



Area Classification Drawing

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:49 2005

Background and Application

Hazardous (classified) areas must be defined as to the type and extent of the hazardous areas. Documentation is usually in the form of an area classification drawing like the one in the illustration or an area classification map for a large facility. Such documentation must be available to properly design, install, inspect, maintain, test, or operate electrical equipment in the hazardous areas. Class, division, and group information, as well as details of the locations and extent of the areas, are necessary for proper installation.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:49 2005

500-4(i) Listed Alternative Protection Techniques

Type of Change New

BRIEF SUMMARY

Industrial. The development of new products for use in hazardous locations is permitted as a protection method.

Code Language

500-4. Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations. (ROP 14-8)

•
•
•

(i) Other Protection Techniques. Other protection techniques used in equipment listed for use in hazardous (classified) locations. (ROP 14-19)

Background and Explanation

Section 500-4 (formerly Section 500-2(a)) provides a list of the various protection techniques permitted for use in hazardous (classified) locations covered by Articles 500 through 504. The addition of new paragraph (i) "Other Protection Techniques." to this list allows the industry to develop new products for use in hazardous locations and recognizes methods already available, such as encapsulation, within listed equipment.

501-4(a) Exc. No. 1 Rigid Nonmetallic Conduit in Class I Locations

Type of Change Revision

BRIEF SUMMARY

Industrial. The conditions for the installation of underground nonmetallic conduit have been clarified.

Code Language

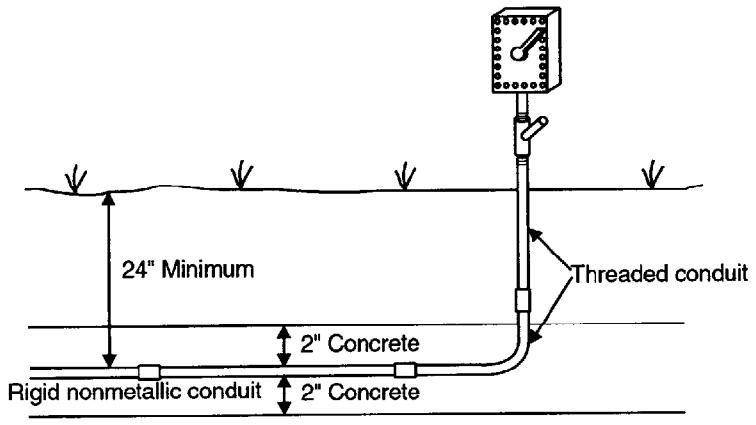
501-4. Wiring Methods. Wiring methods shall comply with (a) and (b).

(a) Class I, Division 1.

(1) Fixed Wiring.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and ~~*buried below the surface under not less than 2 ft (610mm) of earth*~~ ***provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception; Section 514-8, Exception No. 2; and Section 515-5(a).***

Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts. (ROP 14-97)



Rigid Nonmetallic Conduit in Class I, Division 1 Location

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:50 2005

Application

Where rigid nonmetallic conduit is used underground in a Class I, Division 1 area, the conduit must have 24 inches of cover. The conduit must emerge from underground in one of the acceptable metal conduits and the change to metal conduit must also have 24 inches of cover. This exception also requires the nonmetallic conduit to be encased in at least 2 inches of concrete. However, the concrete envelope is not required in similar rules in Articles 511, 514, and 515.

Background and Explanation

The 1996 NEC required cover by 24 inches of earth. Some enforcers interpreted this to mean that conduit under a paved area needed 24 inches of soil plus the pavement plus 2 inches of concrete. The change to 24 inches of cover clarifies the intent. References to Articles 511, 514, and 515 were added to clarify that similar exceptions for underground installations contained in those specific articles do not require concrete encasement.

501-4(a)(1) Exc. No. 3 ITC Cable in Class I, Division 1

Type of Change New

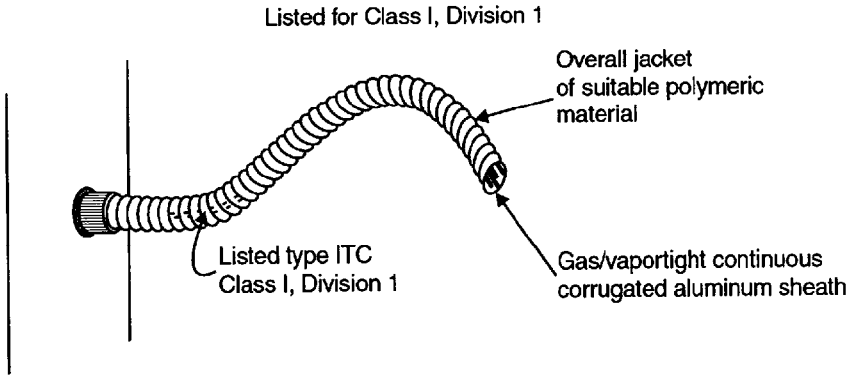
BRIEF SUMMARY

Industrial. Some Type ITC cable may be used in certain industrial Class I, Division 1 locations.

Code Language

501-4. Wiring Methods.
(a) Class I, Division 1.
(1) Fixed Wiring.
•
•
•

Exception No. 3: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application shall be permitted. (ROP 14-105) (ROC 14-47)



ITC Cable in Class I, Division 1 Locations

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:50 2005

Application

Type ITC cable (Instrumentation Tray Cable) is permitted in hazardous (classified) locations in industrial facilities if there is restricted public access and the installation is serviced only by qualified persons. Article 727 covers the general requirements for Type ITC cable and not all such cables are allowed in hazardous locations. The cable construction, listing, and fittings must meet the conditions shown in the illustration.

Background and Explanation

The cable described in this new exception is nearly identical to the MC cable allowed by Exception No. 2 in this same section except that the insulation is rated at 300 volts for the ITC cable and 600 volts for the MC cable. ITC cable is limited to installations where the circuit operates at not greater than 150 volts by Section 727-3(b). Also, except for some small sizes, Type MC cable usually includes a separate equipment grounding conductor. The continuous corrugated sheath of the variety of ITC cable permitted by this new exception provides an adequate grounding path without a separate equipment grounding conductor.

NEC pp. 317–320

501-5(a) & (b) Sealing Requirements Reorganized

Type of Change Reorganization

BRIEF SUMMARY

Commercial and industrial. Section 501-5 was rewritten and reorganized to clarify the rules for conduit seals. Seals in conduits crossing Class I, Division 2 boundaries must be within 10 feet of the boundary.

Code Language

The following outlines of the 1996 and 1999 NEC illustrate the reorganization.

Outlines Illustrating Reorganization

1996 NEC

501-5. Sealing and Drainage.
501-5(a) Conduit Seals, Class I, Division 1
501-5(a)(1) In each conduit entering enclosures with arcs, sparks, high temps
Exception: Hermetically sealed, oil-immersed contacts, factory seals
(FPN): Factory-sealed enclosures do not serve to seal other enclosures.
501-5(a)(2) In each conduit 2 in. or larger with terminals, splices, or taps
501-5(a)(3) Single seal for two or more enclosures
501-5(a)(4) In each conduit leaving the Class I, Division 1 area
Exception: Conduits passing through area without fittings
501-5(b) Conduit Seals, Class I, Division 2
501-5(b)(1) For explosion-proof enclosures, same as (a)(1), (a)(2), and (a)(3)
501-5(b)(2) In each conduit leaving the Class I, Division 2 area
Exceptions 1, 2, 3, 4

1999 NEC Reorganization with New Material Boldfaced

501-5 Sealing and Drainage
501-5(a) Conduit Seals, Class I, Division 1
501-5(a)(1) (a) Conduit entries to enclosures with arcs, sparks, high temps
(b) Conduit entries 2" or larger with terminals, splices, or taps
For the purposes of this section, high temperatures shall be considered to be any temperature exceeding 80 percent of the autoignition temperature
•
•
•
Exception: Hermetically sealed, oil-immersed contact, factory seals
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:51 2005

501-5(a)(2) Conduit entries to pressurized enclosures . . . within 18 in.
(FPN No. 1): Seal location reduces problems in purging conduit.
(FPN No. 2): See NFPA 496-1998.
501-5(a)(3) Single seal for two or more enclosures
501-5(a)(4) In each conduit leaving the Class I, Division 1 area
Exception: Conduits passing through area without fittings
501-5(b) Conduit Seals, Class I, Division 2
501-5(b)(1) For explosion-proof enclosures, same as (a)(1)(a), and (a)(3)
501-5(b)(2) In each conduit leaving Class I, Division 2 area **within 10 ft of boundary**
Exceptions 1, 2, 3, 4

Application

The outlines show the reorganization of Section 501-5(a) and (b) for sealing in Class I, Division 1 and 2 areas. The new last sentence of Section 501-5(a)(1) explains that a "high temperature" is a temperature in excess of 80 percent of the auto ignition temperature of the combustible material producing the classified area. A revision to Section 501-5(b)(2) clarifies the requirement that seals be within 10 feet of the boundary when a conduit crosses a Class I, Division 2 boundary similar to the requirement for a seal within 10 feet of a Class I, Division 1 boundary specified in the 1996 code.

Background and Explanation

The reorganization of Section 501-5(a) and (b) was done to improve usability and accuracy in application. The new text was added to explain what was meant by "high temperatures" in the context of this section.

Section 501-5(b)(2) was changed to clarify that a seal at the boundary of a Class I, Division 2 area must be within 10 feet of the boundary. The previous code said that seals could be on either side of the boundary with no distance restriction. The 10-foot restriction matches the requirement of Section 501-5(a)(4) for Division 1 boundaries.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:51 2005

501-5(a)(2) Sealing Requirements

Type of Change New

BRIEF SUMMARY

Commercial/industrial. A new rule provides requirements for installation of conduit seals around pressurized enclosures.

Code Language

501-5 Sealing and Drainage.

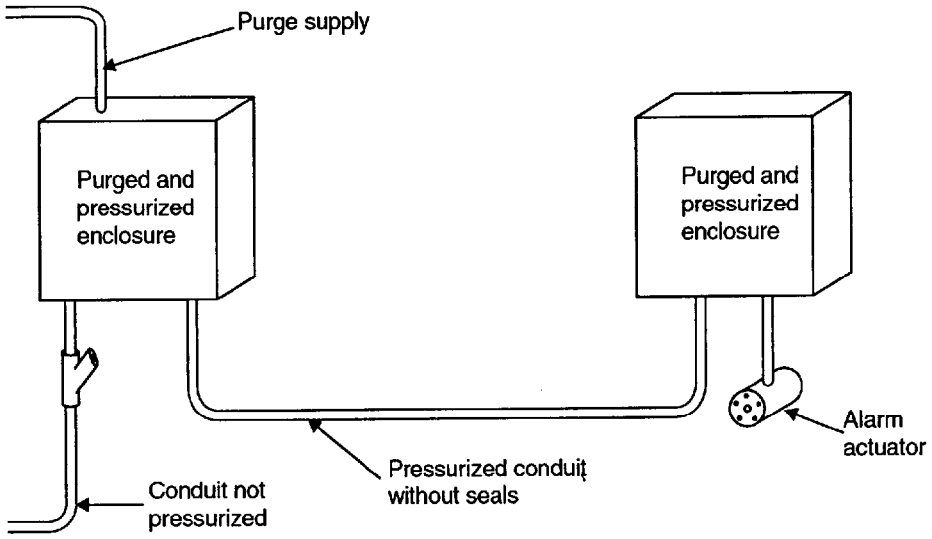
(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located as follows.

•
•
•

(2) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see *Standard for Purged and Pressurized Enclosures for Electrical Equipment,* NFPA 496-1998.



Sealing Purged and Pressurized Enclosures

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:51 2005

Application

The illustration portrays the new requirement in Section 501-5(a)(2). Seals are required in conduits leaving pressurized enclosures if the pressurization system is not intended also to pressurize the conduit system. Such seals must be located within 18 inches of the pressurized enclosure, as shown in the illustration. This rule would most likely apply to Type X purged and pressurized enclosures, although it could also apply to Type Y. Two new FPNs explain that such seals are needed because of the difficulty of purging the dead air space formed by a sealed conduit.

Background and Explanation

NFPA 496 provides requirements for the installation of purged and pressurized enclosures and describes the classification obtained within the enclosure depending on the type of purging and pressurization used. Type X purging and pressurization changes the interior of an enclosure or room from Class I, Division 1 to unclassified. Type Y purging and pressurization changes the interior of an enclosure from Class I, Division 1 to Class I, Division 2. An enclosure is purged of all gases and vapors that might have entered and then pressurized with clean air or nonflammable gas to exclude gases and vapors from entering the enclosure or room. This allows equipment to be installed in a non-explosion-proof enclosure in a hazardous location where the enclosure and the contained equipment would not ordinarily be allowed. The classification of the area surrounding the enclosure is not changed.

In some cases, a purging system can be designed to purge connecting conduits and perhaps more than one enclosure. However, often the conduits leaving the purged enclosure extend to equipment that is required to be explosion-proof. Such conduits are required to be sealed at the explosion-proof enclosures. A conduit connected to a purged enclosure is, in effect, an extension of the purged enclosure and is susceptible to the entry of flammable gases and vapors. Long lengths of conduit that are not part of the purged system, especially conduits that are sealed at one end, are difficult to purge, so the length of such conduits is limited to 18 inches before a seal must be installed.

Wed Feb 02 02:31:51 2005

501-5(c) (3) & (6) Thickness of Sealing Compound and Revised Conductor Fill in Seal Fitting

Type of Change Revision

BRIEF SUMMARY

Industrial. The thickness of sealing compound and conductor fill in conduit sealing fittings has been clarified.

Code Language

501-5. Sealing and Drainage.

•
•
•

(c) Class I, Divisions 1 and 2. Where required, seals in Class I, Division 1 and 2 locations shall comply with the following.

•
•
•

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the **sealing fitting** and in no case less than ⅝ in. (16 mm). (ROP 14-135)

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

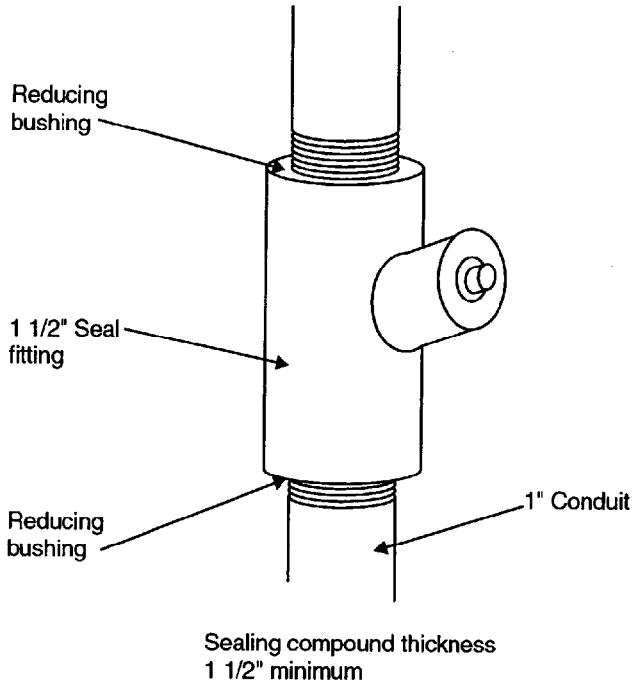
(6) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a **rigid metal** conduit of the same trade size unless it is specifically approved for a higher percentage of fill. (ROP 14-138)

Application

Some conduit seals are listed for 25 percent conductor fill while a conduit of the same trade size may be filled to 40 percent. Section 501-5(c)(6) requires the 25 percent fill requirement to be based on the internal area of a rigid metal conduit that is the same trade size as the conduit seal. Some seals are listed for more than 25 percent fill. In this case, higher fill percentages are allowed.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:52 2005

The minimum thickness for sealing compound is specified in Section 501-5(c)(3). Sealing compound must be at least ⅝ inches thick and not less than the trade diameter of the conduit sealing fitting. When conduit is filled to 40 percent and seals listed for only 25 percent are used, it is necessary to install seals of at least one trade size larger than the conduit. In this case, compound thickness is to be based on the trade size of the sealing fitting rather than conduit size.



Sealing Compound Requirements

Background and Explanation

Section 501-5(c)(3) was revised to clarify that sealing is based on fitting size rather than conduit size. Section 501-5(c)(6) was revised to clarify that conductor fill in sealing fittings is based on rigid metal conduit rather than some other type. The internal diameter of intermediate metal conduit is larger than that of rigid metal conduit. If IMC is installed, the fitting fill is to be calculated based on the cross-sectional area of rigid metal conduit of the same trade size.

501-5(d)(1) Exc. (e)(1) Exc. No. 2 Sealing Shielded Cables

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Shielded cables and twisted pair cables need not have the shield removed or the twisted pairs separated where the cables are sealed.

Code Language

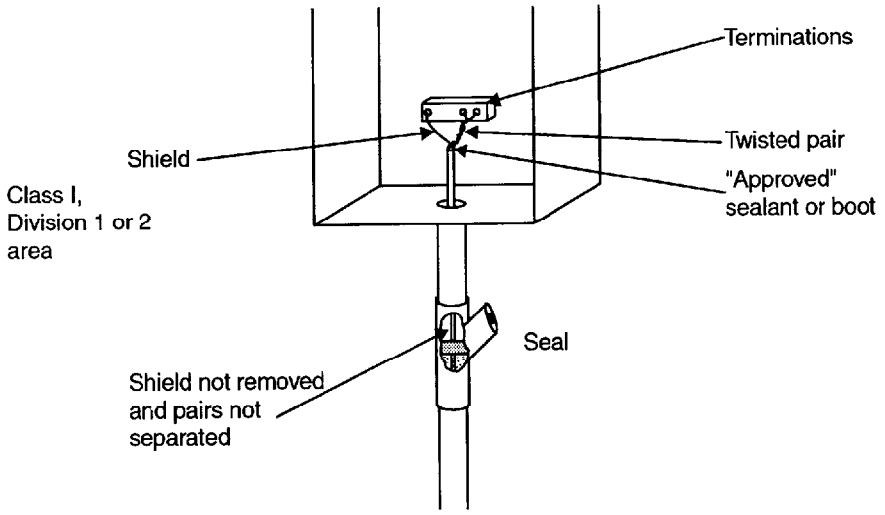
501-5. Sealing and Drainage.

•
•
•

(d) Cable Seals, Class I, Division 1

(e) Cable Seals, Class I, Division 2

Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core. (ROP 14-139)



Sealing Shielded Cable

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:52 2005

Application

The figure shows a shielded twisted-pair cable in a Class I, Division 1 or 2 location. The cable shield is not required to be removed and the twisted pairs are not required to be separated in the sealing fitting if the cable is "sealed" at the termination in an approved manner. This rule is provided in Section 501-5(d)(1) Exception for Division 1 locations and by Section 501-5(e)(1) Exception No. 2 for Division 2 locations.

Background and Explanation

Removal of shields or separation of twisted pairs may prevent the proper operation of instrumentation circuits and similar circuits that rely upon shielding or twisting of pairs as part of their operation. This change permits such cables to be left intact at seals as long as an approved means of sealing the cable from the entry or passage of gases or vapors is provided at terminations.

Wed Feb 02 02:31:53 2005

501-5(e) Exc. No. 1 Cable Ceiling with Type Z Pressurization

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Cables passing from a Type Z purged and pressurized enclosure to the surrounding Class I, Division 2 area are not required to be sealed at the boundary.

Code Language

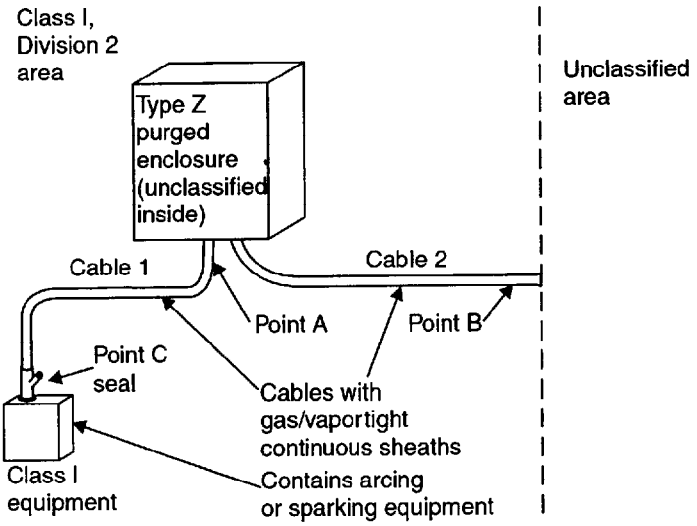
501-5(e). Cable Seals, Class I, Division 2.

•

•

•

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary. (ROP 14-143)



Sealing Type Z Pressurized Enclosures

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:53 2005

Application

The illustration shows two cables leaving a Type Z purged and pressurized enclosure. The interior of the enclosure (or area) is unclassified due to the purging and pressurization of the enclosure or room. The surrounding area is Class I, Division 2. Cable 1 in the illustration is not required to be sealed where it passes into the Class I, Division 2 area at Point A according to Section 501-5(e)(1), Exception No. 1. The cable labeled Cable 2 is shown leaving the enclosure and passing unbroken into the unclassified area at Point B. Cable 2 is not required to be sealed according to Section 501-5(e)(3). However, Cable 1 is required to be sealed at Point C in accordance with Section 501-5(e) because it enters an enclosure that is required to be approved for Class I locations.

Background and Explanation

This new exception applies to cables, but is similar in purpose and effect to Section 501-5(b)(2), Exception No. 3, which applies to conduit. An enclosure located in a Class I, Division 2 area may be made unclassified on the inside through the use of Type Z purging and pressurization. Since the enclosure is unclassified on the inside, cables or conduits connected to the enclosure will not be exposed to the entry of flammable gases or vapors from the enclosure. The risk of having gases or vapors enter the cable or conduit from the surrounding classified area is small because it is a Division 2 area, that is, an area where gases and vapors are not normally present. Even if gases or vapors did enter the cable or conduit from the surrounding area, the pressurization of the system would keep the gases and vapors from migrating to the unclassified area inside the enclosure. Thus, the purpose of seals is fulfilled without a requirement to install seals.

Table 505-10(b)(1). Types of Protection Designation

Designation	*Technique*	*Zone 1**
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Nonhazardous
[ib]	Intrinsically safe associated apparatus	Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Application

Users of this article will find expanded requirements for the use of the zone system for area classification. The requirement for a "qualified registered professional engineer" to oversee the implementation of this system has been relocated from Section 500-3 to Section 505-6(a). The use of increased safety "e" motors and generators that are listed for Class I, Zone 1 locations is now specifically referenced in the revised article.

Background and Explanation

The Class I, Zone 0, 1, and 2 classification system is the NEC version of the system used by the International Electrotechnical Commission (IEC). Information on the IEC system can be found in various publications in the IEC 79 series.

Part of the work done in Article 505 is the result of proposals requesting that the IEC marking system be included in the NEC. The IEC marking information is summarized on new Table 505-10(b)(1). More detailed information on acceptable protection techniques has been placed in Section 505-4. Section 505-10(b)(2) adds an additional marking for NEC applications. The symbol "AEx" is used to indicate that equipment is zone equipment that is also built and tested to American standards.

Section 505-6(b) was added to allow both the class/division and class/zone systems to be used in the same facility. Areas classified using different systems shall not overlap or abut.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:54 2005

505-6(b) & (c) Dual Area Classification

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Areas classified under division and zone classification rules may not overlap, and some may not abut each other, but reclassification is permitted.

Code Language

505-6. Special Precautions.

•
•
•

(b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article. (ROP 14-281)

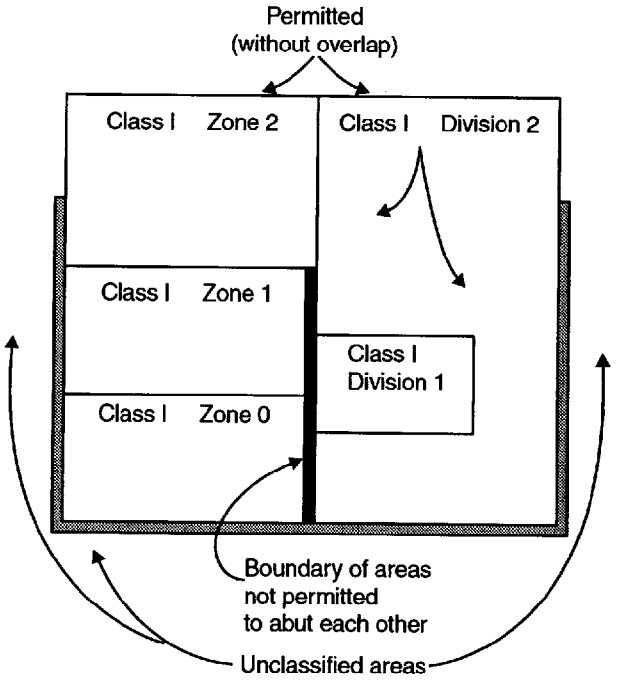
Application

The illustration shows a simplified area classification drawing. The classified areas are bounded by walls on three sides. Half of the total area is classified under the zone classification system and half is classified under the division classification system. The two classification systems are permitted to coexist with restrictions. The Class I, Zone 2 area is permitted to adjoin the Class I, Division 2 area at the top of the drawing. However, the Class I, Zone 0 and Zone 1 areas may not adjoin the Class I, Division 1 and Division 2 areas. The illustration shows a heavy line at the boundaries of the areas that are not permitted to be adjacent to each other.

Reclassification is permitted under certain conditions. As long as the entire area classified because of any single flammable source is reclassified, the change from division to zone classification is permitted. For example, the area identified in the drawing as Class I, Division 1 might be reclassified as Class I, Zone 1. The surrounding Division 2 area could then be reclassified as Zone 2, and the violations in the original layout would be resolved. A portion of the Division 2 area that abuts

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:54 2005

the Zone 0 area might also have to be reclassified as Zone 1 to meet the requirements of Section 505-9(b)(4). The remaining portion of the Class I, Division 2 area could retain its division classification as long as it was not classified due to a flammable gas or vapor source that existed in the reclassified areas.



Classification by Zone and Division

Background and Explanation

As the use of the zone classification system becomes more common, personnel in many facilities will find themselves with adjoining areas that are classified under different systems. This change clarifies what areas are permitted to abut each other and allows reclassification to resolve conflicts.

One basic concept in both the division and zone classification systems is that areas adjoining a higher risk area often are classified as the next lower risk area. Thus, areas abutting Zone 0 areas are generally Zone 1 areas, and areas adjoining Division 1 areas are generally Division 2 areas. Division 2 and Zone 2 areas are classified based on essentially the same level and type of risk, so it makes sense that they could lie next to each other. On the other hand, Division 1 is not quite the same as Zone 0 or Zone 1, so rather than allow such areas to abut each other, they must be reexamined and reclassified for consistency. The practical effect of this rule is to require a sort of buffer zone of Division 2 and Zone 2 or unclassified areas between higher risk areas.

513-1 Aircraft Hangar Scope

Type of Change Revision

BRIEF SUMMARY

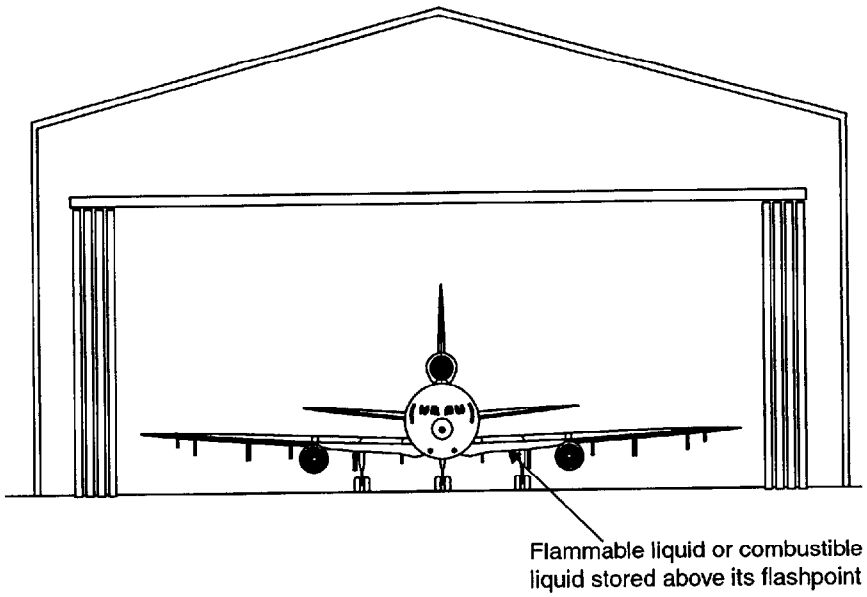
Aircraft hangars. The types of buildings covered by Article 513 have been clarified.

Code Language

513-1. Scope. **This article shall apply to buildings or structures inside any part of which aircraft containing Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed or stored and in which aircraft might undergo service, repairs, or alterations.** It shall not apply to locations used exclusively for aircraft that have never contained ~~such liquids or gases~~ fuel or ~~aircraft drained and properly purged~~ unfueled aircraft.

FPN No. 1: For definitions of aircraft hangar and unfueled aircraft, see *Standard on Aircraft Hangars,* NFPA 409-1995.

FPN No. 2: For further information on fuel classification, see *Flammable and Combustible Liquids Code,* NFPA 30-1996, and *Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids,* NFPA 325-1994. (ROP 14-331)



Applicability of Article 513 Depends on Fuel Type.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:55 2005

Application

The revised scope statement recognizes that it is not necessary to classify areas in which the aircraft fuel is a Class II (combustible liquid) unless it will be handled or stored above its flashpoint.

Background and Explanation

In the 1996 NEC, Article 513 covered buildings where the aircraft contained flammable fuels or any jet fuel. A flammable fuel is a liquid with a flash point of less than 100°F. Liquids with a flash point above 100°F are classified as combustible. Jet-A fuel has a flash point of over 100°F and is a combustible liquid. In general, combustible liquids do not require area classification. Based on 1996 code requirements, the storage areas and areas where fuel trucks are filled would not be classified but the hangar would be. The revised wording clarifies the intent that Jet-A fuel is only of concern if it is heated above its flash point.

Purging of fuel tanks is not possible to achieve by formal definition. NFPA 409, standard for aircraft hangars, defines "unfueled" as the lowest level technically possible (½ percent). The term "purged" has been replaced with "unfueled." The revision eliminates these conflicts and brings Section 513-1 into agreement with the definition in NFPA 409.

Wed Feb 02 02:31:55 2005

513-4 Mechanical Systems in Pits and Vaults

Type of Change Revision

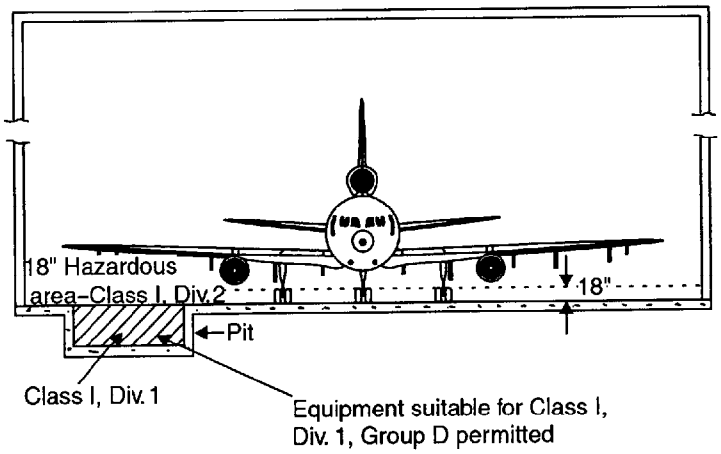
BRIEF SUMMARY

Commercial. The restriction on "other services" in vaults, pits, and ducts in aircraft hangars has been removed.

Code Language

513-4. Wiring and Equipment in Class I Locations. All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513-3 shall comply with the applicable provisions of Article 501. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided. ~~and the wiring shall not be placed within the same compartment with any other service other than compressed air~~

Attachment plugs and receptacles in Class I locations shall be approved for Class I locations or shall be designed so that they cannot be energized while the connections are being made or broken. (ROP 14-332, 14-334, 14-335)



Equipment in Aircraft Hangar Pit

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:55 2005

Application

The removal of the restriction on other services will allow services other than compressed air piping to occupy vaults, pits, and ducts in aircraft hangars with wiring. Presumably such other services might include lubrication piping, water lines, or other fluid supplies that are utilized for the servicing of aircraft within landing gear pits.

Background and Explanation

The change to this section reflects the permission to install Class I, Division I, Group D electrical equipment in landing gear pits, ducts, and tunnels. This permission is found in Section 2-9.2 of NFPA 409-1995 *Standard on Aircraft Hangars*. This does not permit the introduction of electrical wiring within ducts used for ventilating the pit, since Section 300-22(a) prohibits wiring systems in a duct used to transport flammable vapors.

514-6 Dispenser Disconnects to Prevent Feedback

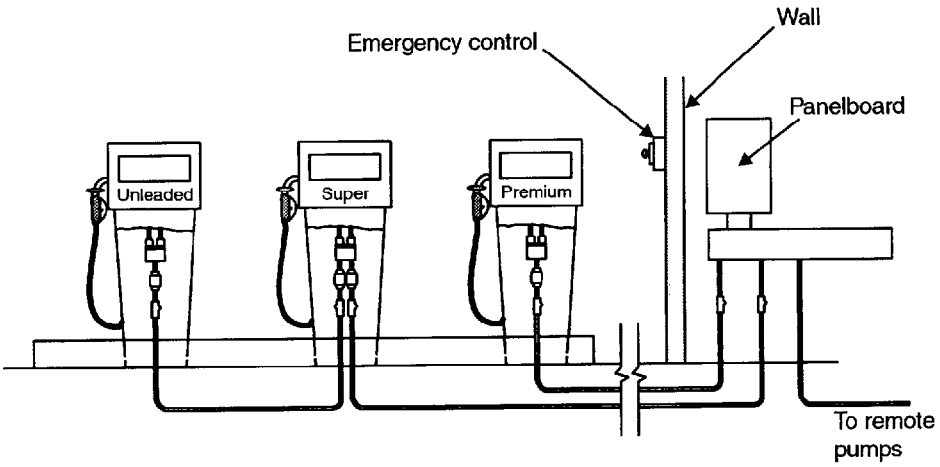
Type of Change New

BRIEF SUMMARY

Gasoline service stations. This section provides improved electrical safety during maintenance of dispensers.

Code Language

514-6. Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment. (ROC 14-127)



Isolation required for dispenser control circuits to prevent feedback

Isolation of Dispensing Equipment

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:56 2005

Application

Provisions must be made to disconnect all sources of power, including parallel wiring that could allow possible feedback, from dispensing devices. Some systems now in use may allow pump circuits to backfeed power to a dispenser from remote control circuits when the circuit to the dispenser is disconnected. To eliminate shock hazards to personnel servicing dispensing and related equipment, positive disconnection is required for all possible power sources in the equipment.

Background and Explanation

This change was made based on reports from the field that indicate some control systems now in use allow dangerous feedback into equipment that has been de-energized for servicing due to the use of parallel control circuits. This revision is intended to provide additional safety for personnel servicing dispensing equipment by isolating the equipment.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:57 2005

515-7 Dispensing of Volatile Flammable Liquids

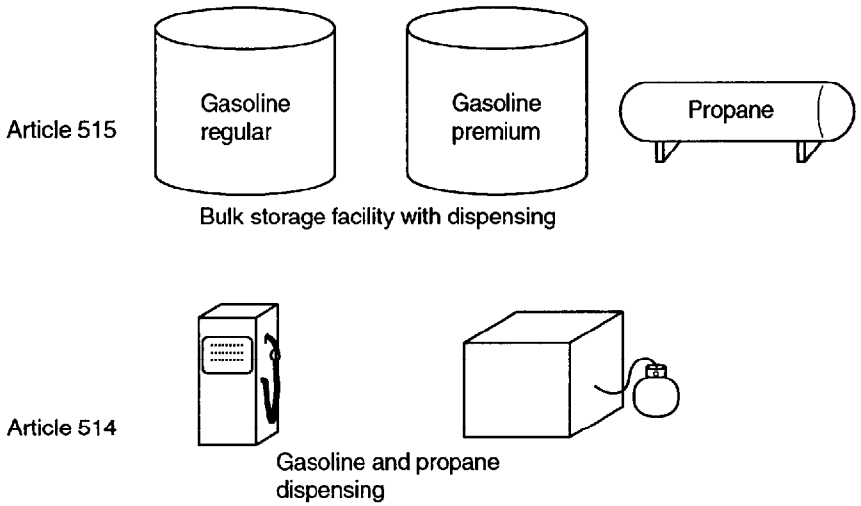
Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Article 514 applies to areas of bulk storage facilities that are used for dispensing any flammable liquids or gases, not just gasoline.

Code Language

515-7. Gasoline Dispensing. Where gasoline **or other volatile flammable liquids or liquefied flammable gases are dispensed at bulk stations,** the applicable provisions of Article 514 shall apply. (ROP 14-383)



Bulk Storage with Dispensing

Application

If a bulk storage facility includes dispensing operations, the dispensing operations fall under the scope of Article 514 and are required to comply with that article. Although the title of Article 514 is "Gasoline Dispensing and Service Stations," the article also applies to the dispensing of flammable liquids and liquefied flammable gases other than gasoline. A bulk storage location containing a dispensing area is shown in the illustration.

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:57 2005

Background and Explanation

The definition of "gasoline dispensing and service stations" is found in Section 514-1, and not in Article 100 or Article 515. For this reason, some code users applied the provisions of Article 514 to dispensing areas in bulk storage facilities only when the dispensed product was gasoline, because only gasoline was mentioned in Section 515-7. This change clarifies that Article 514 also applies to areas of bulk storage facilities where flammable products other than gasoline are dispensed.

Article 515 covers storage and transfer of flammable liquids in bulk, such as from or to pipelines, tank cars, and tank vessels. Article 514 covers the transfer of flammable liquids to fuel tanks of self-propelled vehicles or other relatively small containers. Many facilities have areas that are covered by one or both articles. For example, both Article 514 and Article 515 provide identical dimensions for classified areas around the fill openings of underground tanks, but aboveground tanks are covered only by Article 515. In the absence of specific rules for aboveground tanks in Article 514, Article 515 could also apply. Both articles apply to a bulk storage plant with dispensing areas.

Wed Feb 02 02:31:58 2005

517-3 Definition of Emergency Systems

Type of Change Revision

BRIEF SUMMARY

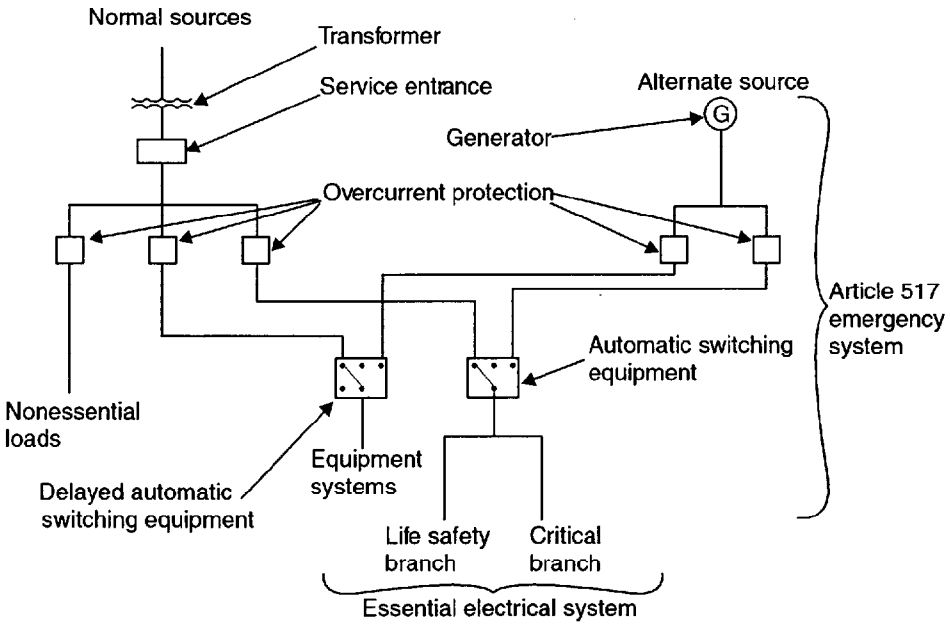
Hospitals. Article 517 contains emergency system requirements beyond the general requirements in Article 700.

Code Language

517-3. Definitions.

•
•
•

Emergency System. A system of feeders and branch circuits meeting the requirements of Article 700, **except as amended by Article 517,** and intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and patient safety, with automatic restoration of electrical power within 10 seconds of power interruption. (ROP 17-7)



Hospital Emergency System

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:58 2005

Application

Where the emergency system requirements in Article 517 differ from those in Article 700, Article 517 requirements are to be used in health-care facilities. Additional requirements such as those for the subdivision of the emergency system are unique to health-care facilities and are contained in Article 517.

Background and Explanation

Some enforcers and installers have had problems determining when to use Article 517 and when to follow Article 700. The revision to the definition clarifies that the requirements of Article 517 concerning the arrangement and installation of the health-care facility emergency system expand on the requirements of Article 700.

Wed Feb 02 02:31:59 2005

517-13(a) Exc. No. 3 Redundant Grounding

Type of Change Revision

BRIEF SUMMARY

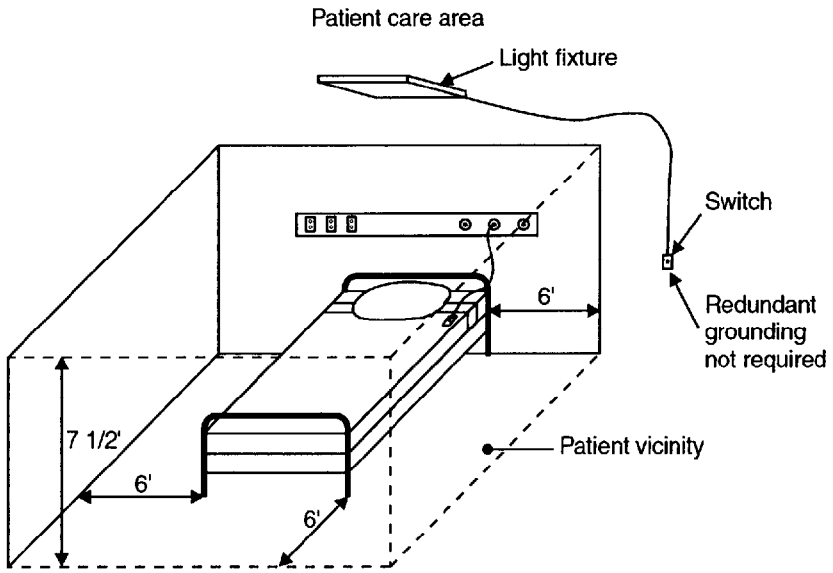
Hospitals. Switches located outside the patient vicinity are not required to be grounded by an insulated equipment grounding conductor.

Code Language

517-13(a). Patient Care Areas.

•
•
•

Exception No. 3: Light fixtures more than 7½ ft (2.2 m) above the floor ***and switches located outside of the patient vicinity*** *shall not be required to be grounded by an insulated grounding conductor.* (ROP 17-12) (ROC 17-9)



Grounding Outside Patient Vicinity

Copyright by the National Fire Protection Association
Wed Feb 02 02:31:59 2005

Application

Metal parts of switches, light fixtures, and similar equipment are required to be grounded by a metal raceway or suitable cable armor or sheath as well as by an insulated equipment grounding conductor if the equipment is located in a "patient vicinity." A patient vicinity is defined in Section 517-3 and depicted in the illustration. The redundant grounding requirement applies to electrical equipment within the patient vicinity. The illustration shows a fixture and switch that are not required to have redundant grounding because they are outside the patient vicinity.

Metal parts of switches and metal faceplates are required to be grounded in accordance with Section 380-9 by a metal mounting screw or screws connected to the grounded metal yoke of a switch or other device whether they are located in a patient vicinity or not.

Background and Explanation

Equipment in patient vicinities requires redundant grounding. This requirement is achieved by installing an insulated equipment grounding conductor in a metal raceway or in a metal cable that is constructed with a sheath or armor that is an acceptable grounding return path. Section 517-13(a) Exception No. 3 of the 1996 NEC exempted light fixtures more than 7½ feet above the floor from the redundant grounding requirement because such fixtures are outside the patient vicinity. This code change is intended as clarification that the redundant grounding requirement does not cover switch yokes where the switches are located outside the patient vicinity. A change in Section 380-9 of the 1999 NEC requires all switch yokes to be grounded in accordance with Article 250 whether or not metal faceplates are used.

Wed Feb 02 02:32:00 2005

517-18(c) Listed Tamper Resistant Covers in Pediatric Areas

Type of Change Revision

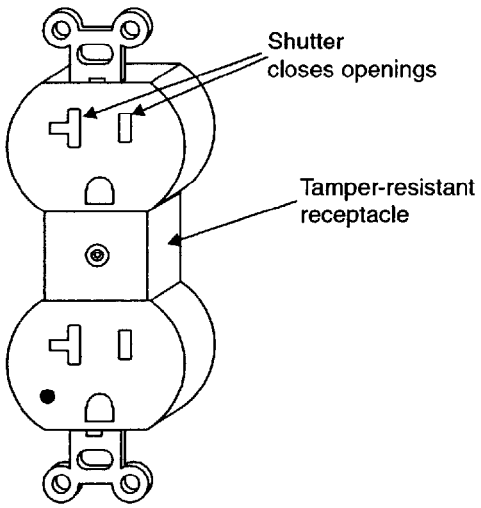
BRIEF SUMMARY

Hospitals. Receptacles and covers allowed in pediatric areas must be listed as tamper resistant.

Code Language

517-18. General Care Areas.

(c) Pediatric Locations. Fifteen- and 20-ampere, 125-volt receptacles intended to supply patient care areas of pediatric wards, rooms, or areas shall be **listed** tamper resistant **or shall employ a listed tamper resistant cover.** (ROC 17-22)



Protection in Pediatric Areas

Application

Due to the presence of children in pediatric care areas the NEC restricts the type of receptacles that may be used. Pediatric care areas, wards, or rooms are the areas where small children are most likely to have access to receptacles. Tamper resistant features limit the possibility of a conductive object being inserted into the receptacle slots. In these areas, only listed tamper resistant receptacles or listed tamper resistant covers are permitted as a safety feature to limit access to live parts.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:00 2005

Background and Explanation

An exception to this section in the 1996 NEC allowed covers that would limit improper access. Faceplates with lift-up caps or domed covers were used in some installations that were not listed tamper resistant and did not provide the same level of protection as listed tamper resistant receptacles. The panel accepted the inclusion of listed tamper resistant covers as an acceptable method of limiting access to the energized parts of the receptacle.

Wed Feb 02 02:32:01 2005

517-30(c)(3) Exc. No. 5 Flexible Wiring Methods in Listed Office Furnishings

NEC p. 366

Type of Change Revision

BRIEF SUMMARY

Hospitals. Listed office furnishings containing emergency system branch circuits may be wired by flexible metal raceways and cable assemblies.

Code Language

517-30(c). Wiring Requirements.

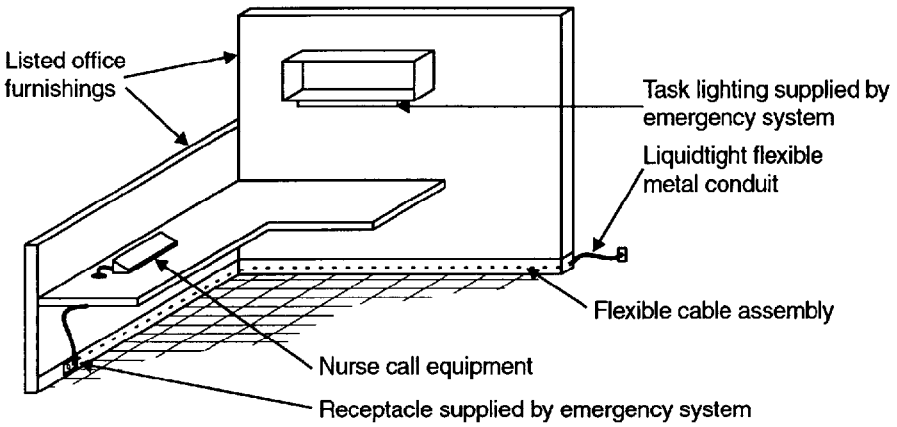
•
•
•

(3) Mechanical Protection of the Emergency System.

The wiring of the emergency system of a hospital shall be mechanically protected by installation in nonflexible metal raceways, **or shall be wired with Type MI cable. Where installed as branch circuit conductors serving patient care areas, the installation shall comply with the requirements of Section 517-13.**

•
•
•

*Exception No. 5: Flexible metal raceways and cable assemblies shall be permitted to be used in listed prefabricated medical headwalls, **listed office furnishings,** or where necessary for flexible connection to equipment.*



Listed Office Furnishings and Emergency Power

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:02 2005

Application

The illustration shows a nurses' station with equipment, task lighting, and receptacles required by Section 517-33(a)(3) and (5) to be on the critical branch of an emergency system. Because the nurses' station is constructed with listed office furnishings, liquidtight flexible metal conduit furnished as part of the office furnishings is allowed to be used to contain the emergency circuits. Similarly, the wiring internal to the office furnishings is also allowed to be in flexible metal raceways and cable assemblies.

Background and Explanation

The main rule of Section 517-30(c)(3) for wiring of the emergency system branch circuits requires mechanical protection of the emergency circuits by nonflexible metal raceways. Former Exception No. 6 in the 1996 code allowed flexible metal raceways or cable assemblies in prefabricated metal headwalls and where required for flexibility for equipment connections. The old Exception No. 5 was reworded into positive language in the main rule of Section 517-30(c) to allow the use of MI cable. Former Exception No. 6 then became Exception No. 5 and "listed office furnishings" was added. The word "listed' was also added to prefabricated metal headwalls.

Although the revised wording says "in" listed headwalls and listed office furnishings, the substantiation for the change said such wiring methods were needed for "connection, interconnection, and reconfiguration" of the office furnishings. The panel statement also referred to a reliance on the listing process, so all such raceways furnished as part of the listed office furnishings should be considered to be included in the exception.

Since the new wording says that flexible methods may be used in listed headwalls and office furnishings, this is more of a product standard than a code rule for field use, since the internal wiring of listed equipment need not be inspected in the field.

Wed Feb 02 02:32:02 2005

517-33[x](c) Identification of Critical Branch Receptacles

Type of Change New

BRIEF SUMMARY

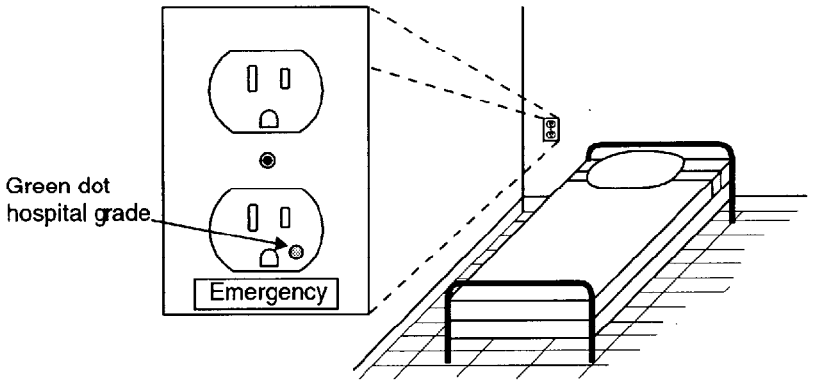
Hospitals. Receptacles on critical branch circuits must be identified.

Code Language

[x]517-33. Critical Branch.

•
•
•

[x] **(c) Receptacle Identification. The receptacles or the faceplates for receptacles supplied by the critical branch shall have a distinctive color or marking so as to be readily recognizable.** (ROP 17-40)



Critical Branch Identification

Application

All receptacles on the critical branch must be identified. This new requirement does not specify the type of identification that must be used. Receptacles, faceplates, or both may be identified by color. While red is usually the color of choice in installations of this kind, red is not specifically required. Any color may be used, provided that the color for the critical branch receptacles or faceplates are different from the normal system. Other methods, such as marking with tags or engraved plates, are also acceptable.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:03 2005

Background and Explanation

This material is extracted text from the *Standard for Health-Care Facilities, NFPA 99* and covers all receptacles installed on the critical branch. This expands the identification requirement beyond the scope of Section 517-19(a) identification requirement for receptacles installed on the emergency system at patient bed locations in a critical-care area. The receptacles installed at the critical-care patient bed locations have additional marking requirements specified by Section 517-19(a).

517-160 (a)(5) Use of Identified Grounded Terminal

Type of Change Revision

BRIEF SUMMARY

Hospitals. On isolated power systems, the orange conductor is to be connected to terminals identified for connection to a grounded conductor.

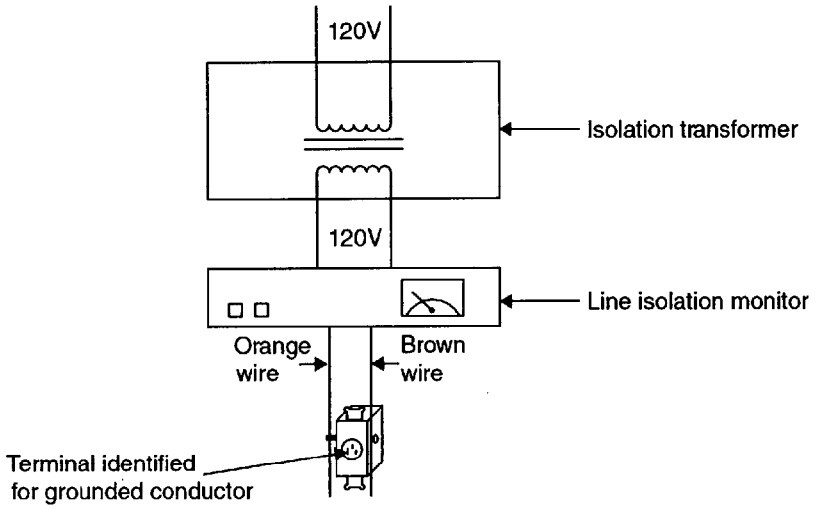
Code Language

517-160. Isolated Power Systems.
(a) Installations.
•
•
•
(5) The isolated circuit conductors shall be identified as follows:

Isolated Conductor No. 1—Orange

Isolated Conductor No. 2—Brown

For 3-phase systems, the third conductor shall be identified as yellow. **Where isolated circuit conductors supply 125-volt, single-phase, 15- and 20-ampere receptacles, the orange conductor(s) shall be connected to the terminal(s) on the receptacles that are identified in accordance with Section 200-10(b) for connection to the grounded circuit conductor.** (ROP 17-49)



Use of Wiring Devices with Isolated Power System Conductors

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:04 2005

Application

The illustration shows a typical 125-volt, 15-ampere rated receptacle connected to an isolated power system. The conductors are required to be orange, brown, or yellow for the third conductor of a 3-phase system. The orange conductor must be connected to the terminals marked for connection to grounded conductors. Terminals for grounded conductors are identified by white-colored metal, the word "white," or the letter "W," in accordance with Section 200-10(b).

Background and Explanation

This change was meant to clarify how isolated power systems are to be polarized when there is no grounded conductor. The choice of orange for the conductor connected to the white terminal of a receptacle correlates with the Canadian Electrical Code.

Wed Feb 02 02:32:04 2005

518-4(a) AC Cable in Places of Assembly

Type of Change Revision

BRIEF SUMMARY

Places of assembly. Some use of Type AC cable in places of assembly is allowed.

Code Language

518-4. Wiring Methods.

(a) General. The fixed wiring methods shall be metal raceways, **flexible metal raceways,** nonmetallic raceways encased in not less than 2 in. (50.8 mm) of concrete, Type MI, MC, **or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250-122.** (ROP 15-22) (ROC 15-19a)

Application

Type AC cable with an insulated equipment grounding conductor is allowed as a wiring method in areas covered by Article 518. In previous editions of the NEC, Type AC cable was only permitted to be used in places of assembly that were not required to be fire-rated. Where used in a building that is not required to be fire-rated, Type AC cable is permitted and is not required to have an insulated equipment grounding conductor.

Background and Explanation

The armor of Type AC cable is permitted to serve as the equipment grounding conductor. This revision allows the use of Type AC cable in fire-rated construction only where an insulated equipment grounding conductor is provided in the cable construction. Therefore this wiring method provides redundant grounding where used in a place of assembly that is required to be fire-rated. The change also clarifies that flexible metal conduits such as liquidtight flexible metal conduit and flexible metal conduit are permitted wiring methods.

518-4(c) FPN Description of Finish Rating

Type of Change New

BRIEF SUMMARY

Commercial. A new FPN was added to explain the meaning of the term "finish rating."

Code Language

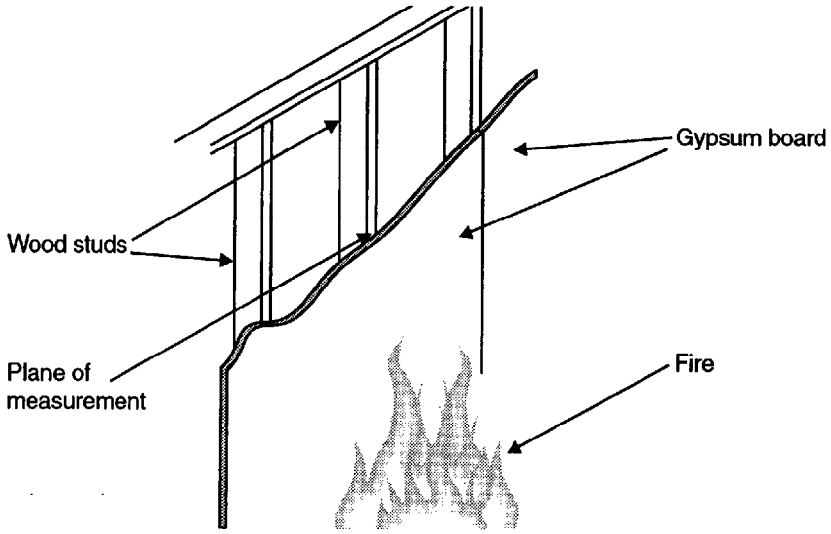
518-4. Wiring Methods.

•
•
•

(c) Spaces with Finish Rating.

•
•
•

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling. (ROP 15-23)



Finish Ratings

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:05 2005

Application

Section 518-4(c) allows electrical nonmetallic tubing (ENT) or rigid nonmetallic conduit (RNC) in several specifically identified places of assembly where the ENT or RNC is concealed behind a thermal barrier with at least a 15-minute finish rating. A new FPN describes this finish rating. The illustration shows how such a finish rating is established.

Background and Explanation

An FPN was added to Section 331-3(2) in the 1996 code to explain the term "finish rating" as it applies to the use of ENT in buildings of over three floors above grade. The same wording was used in this new FPN.

Both FPNs provide information to show that finish ratings differ from fire-resistance ratings. Although finish ratings are determined by testing an assembly of wood supports, the finish rating belongs to the thermal barrier material, such as the gypsum board in the illustration, and not to the complete assembly. Fire-resistance ratings, on the other hand, apply to complete assemblies. Finish ratings are concerned with the temperature inside a wall, behind a thermal barrier. Fire-resistance ratings are concerned with the temperature on the side of an assembly opposite a fire. Thus, the gypsum board could be installed on steel studs and still retain its finish rating, even though the fire resistance rating of the steel stud assembly might change. Notice also that ENT and RNC are not restricted to wood construction, but they must remain concealed behind the thermal barrier in places of assembly. Penetrations of the thermal barrier must be made with other wiring methods.

520-25(d) Listed Dimmers Over 150 Volts Between Conductors

Type of Change Revision

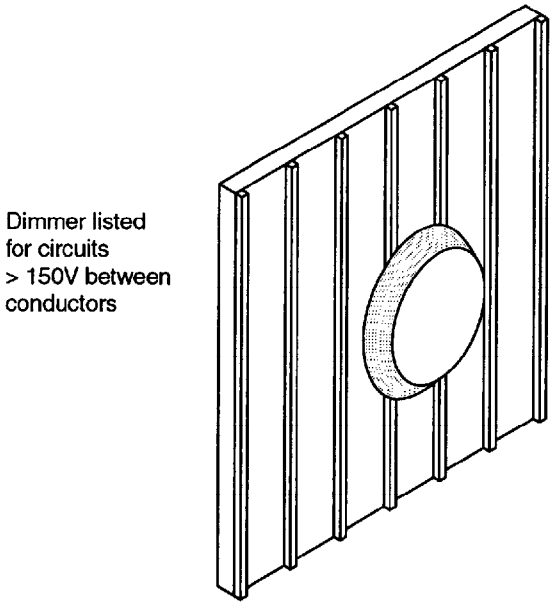
BRIEF SUMMARY

Theaters. Requires listing of solid-state dimmers operating at over 150 volts between conductors.

Code Language

520-25. Dimmers. Dimmers shall comply with (a) through (d).

(d) Solid-State-Type Dimmers. The circuit supplying a solid-state dimmer shall not exceed 150 volts between conductors unless the dimmer is **listed** specifically for higher voltage operation. Where a grounded conductor supplies a dimmer, it shall be common to the input and output circuits. Dimmer chassis shall be connected to the equipment grounding conductor.



Dimmer for Circuits Over 150 Volt Between Conductors

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:06 2005

Application

Solid-state dimmers used in theaters in circuits of over 150 volts between conductors are required to be listed.

Background and Explanation

This revision was made to ensure that solid-state dimmers over 150 volts between conductors are constructed to a recognized product standard. Prior to the 1999 NEC, the only requirement for this type of device was the approval of the authority having jurisdiction.

520-73 Switched Receptacles in Dressing Rooms

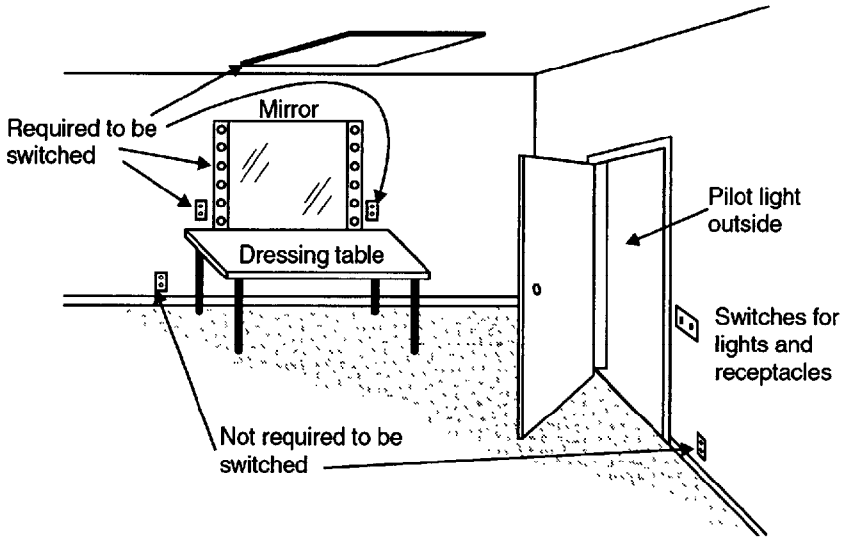
Type of Change Revision

BRIEF SUMMARY

Theaters. Receptacles not located at a dressing table in a dressing room may be unswitched. The required pilot light must be located outside the dressing room, adjacent to the door.

Code Language

520-73. Switches Required. All lights **and any receptacles adjacent to the mirror(s) and above the dressing table counter(s) installed in dressing rooms shall be controlled by wall switches installed** in the dressing room(s). Each switch controlling receptacles **adjacent to the mirror(s) and above the dressing table counter(s)** shall be provided with a pilot light **located outside the dressing room, adjacent to the door** to indicate when the receptacles are energized. **Other outlets installed in the dressing room shall not be required to be switched.** (ROP 15-49)



Switched Receptacles in Dressing Rooms

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:07 2005

Application

Switches must be provided to control lights and receptacles in dressing rooms. This change now requires only receptacles located adjacent to mirrors or above dressing tables to be switched. A pilot light must be provided to indicate that the switch is on. The pilot light must be located outside the dressing room. The illustration shows switches controlling receptacles and lights in a dressing room. A separate pilot light for monitoring the switched receptacles must be installed outside the dressing room. Receptacles not at the dressing table are not required to be switched.

Background and Explanation

Receptacles are often provided in dressing rooms for refrigerators, computers, and similar appliances. Such appliances are not required to be controlled by wall switches. Those receptacles that are likely to be used for hair dryers and similar devices that might present a hazard if left on are required to be controlled by switches. This change also requires that the pilot lights for such switched receptacles be located outside the room. The switches are required to be installed inside the dressing room.

525-12(a) & 13(g) Conductors Inside Tents; Protection for Lamps Inside Tents

Type of Change Revision; New

BRIEF SUMMARY

Carnivals circuses, fairs, and similar events. The vertical clearances of Section 225-18 apply only to wiring outside tents. Wiring inside of tents must be protected from physical damage, and guards must be provided for lamps.

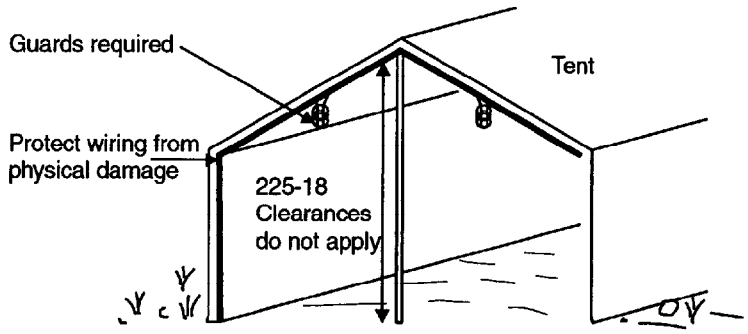
Code Language

525-12. Overhead Conductor Clearances.

(a) Vertical Clearances. Conductors shall have a vertical clearance to ground in accordance with Section 225-18. **These clearances shall apply only to wiring installed outside of tents and concessions.** (ROP 15-54)

525-13. Wiring Methods.

(g) Inside Tents and Concessions. Electrical wiring for temporary lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All temporary lamps for general illumination shall be protected from accidental breakage by a suitable fixture or lampholder with a guard. (ROP 15-55)



Wiring Inside Tents

Application

The illustration shows a small tent used at a carnival or fair. As shown in the illustration, the vertical clearances of Section 225-18 do not apply to wiring inside of tents. The wiring inside of a tent must be protected from physical damage and lamps used for temporary lighting must be provided with guards.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:08 2005

Background and Explanation

Many small tents do not have adequate height to maintain the heights required by Section 225-18 for outside wiring, so the wiring inside such tents is exempted by this change. However, the wiring and lamps must be protected against physical damage.

Wed Feb 02 02:32:09 2005

525-18 GFCI Requirements for Carnivals, Circuses, and Fairs

Type of Change Revision

BRIEF SUMMARY

Carnivals and similar events. GFCI protection is required for some 125-volt, 15- and 20-ampere receptacles.

Code Language

525-18. Ground-Fault Circuit-Interrupter Protection for Personnel.

(a) General-Use 15- and 20-Ampere, 125-Volt Receptacles. All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are in use by personnel shall have listed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 12 in. (305 mm) of the attachment plug. For the purposes of this section, listed cord sets incorporating ground-fault circuit-interrupter protection for personnel shall be permitted. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle.

(b) Appliance Receptacles. Receptacles supplying items, such as cooking and refrigeration equipment, which are incompatible with ground-fault circuit-interrupter devices shall not be required to have ground-fault circuit-interrupter protection. (ROC 15-53) (TCC 15-52, 15-53)

(c) Other Receptacles. Other receptacle outlets not covered in (a) or (b) shall be permitted to have ground-fault circuit-interrupter protection for personnel, or a written procedure shall be continuously enforced at the site by one or more designated persons to ensure the safety of equipment grounding conductors for all cord sets and receptacles, as described in Section 305-6(b)(2). (ROP 15-68)(ROC 15-53) (TCC 15-52)

Application

GFCI protection for 125-volt, 15- and 20-ampere receptacles may be provided by several methods. As in any other location, the required protection can be achieved through a GFCI circuit breaker or GFCI-type device. Section 525-18(a) recognizes GFCI devices that are an integral part of the cord.

Some older cooking or refrigeration equipment may not be compatible with Class A GFCI devices (those designed to operate at 5mA). In these situations, Section 525-18(b) permits the omission of the GFCI protection.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:09 2005

GFCI Protection for Receptacles at Carnivals, Circuses, and Fairs

Background and Explanation

Carnival set-up and tear-down is frequently done in bad weather. Due to the presence of moisture and wear and tear to cords due to frequent moves, additional levels of protection are needed. This revision provides for protection similar to Article 305 for temporary wiring yet also provides for some special needs such as the use of older refrigeration and cooking equipment that may have higher levels of leakage currents than newer appliances.

NEC pp. 397–398

547-8 Disconnects and Grounding at Agricultural Buildings

Type of Change New

BRIEF SUMMARY

Agricultural buildings. The term "distribution point" was defined. Three arrangements of service and feeder disconnects and overcurrent protection were created. The previous requirements of Section 547-8 on bonding and creation of an equipotential plane were revised and relocated to Section 547-9.

Code Language

547-8. Service Equipment, Separately Derived Systems, Feeders, Disconnecting Means, and Grounding. Where one or more agricultural buildings are supplied from a distribution point, the disconnecting means and grounding of services and feeders shall comply with (a), (b), or (c).

(a) Disconnecting Means and Overcurrent Protection at a Building(s). Where the disconnecting means and overcurrent protection are located at the load end of the service conductors, service equipment grounding shall meet the requirements of Section 250-24. A disconnecting means shall also be installed at the distribution point when two or more buildings are supplied from that distribution point.

(b) Disconnecting Means and Overcurrent Protection at Distribution Point. Where the disconnecting means and overcurrent protection are located at the distribution point, feeders to buildings shall meet the requirements of Section 250-32 and Article 225, Part B. (TCC 19-8)

(c) Disconnecting Means Without Overcurrent Protection at the Distribution Point. Where the disconnecting means without overcurrent protection is located at the distribution point and a disconnecting means and overcurrent protection is located at the building(s), the grounded circuit conductor connection to the grounding electrode shall not be permitted at the building disconnecting means at each building and all of the following conditions shall be met.

(1) All buildings and premises wiring are under single management.

(2) Disconnecting means suitable for use as service equipment is provided at the distribution point.

(3) An equipment grounding conductor is run with the supply conductors and is of the same size as the largest supply conductor, if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different materials.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:10 2005

(4) The equipment grounding conductor is bonded to the grounded circuit conductor at the distribution point or at the source of a separately derived system.

(5) A grounding electrode system is provided and connected to the equipment grounding conductor at the building disconnecting means.

Distribution Point. A centrally located electrical supply structure from which services or feeders to agricultural buildings and other buildings, including the associated farm dwelling, are normally supplied. (ROC 19-7, 19-8)

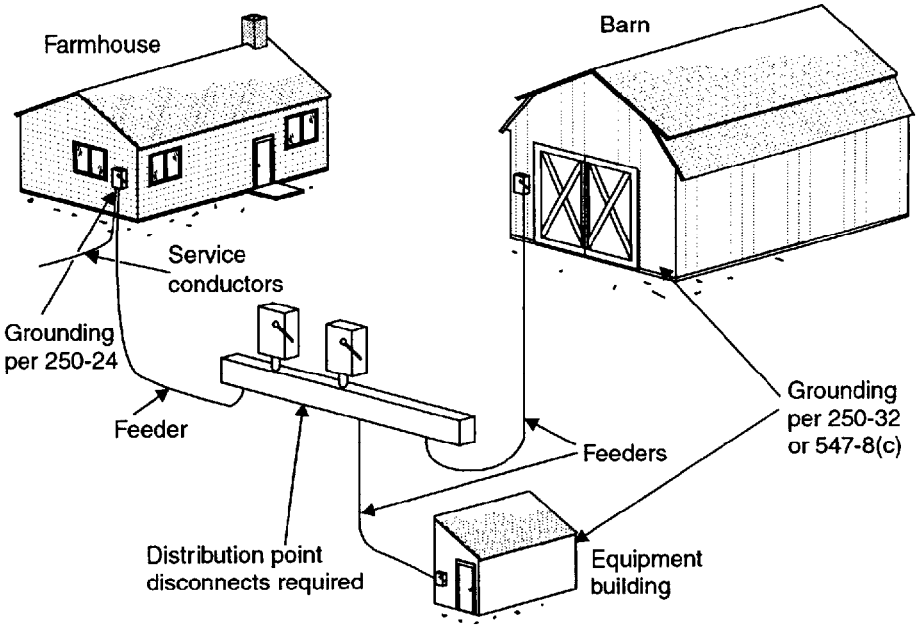

Figure 1. Distribution Point on Load Side of Service

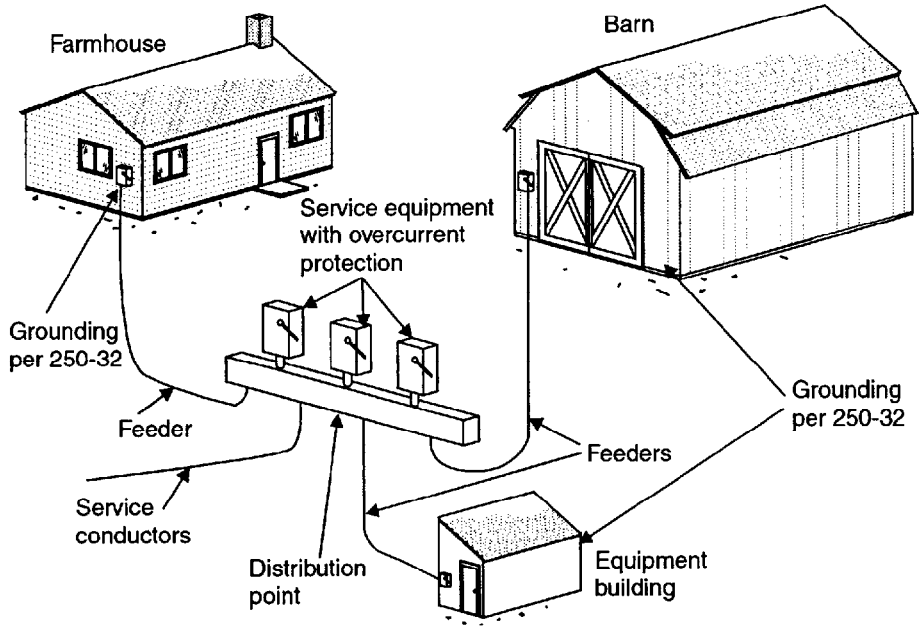

Figure 2. Service Disconnects and Overcurrent Protection at Distribution Point

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:11 2005

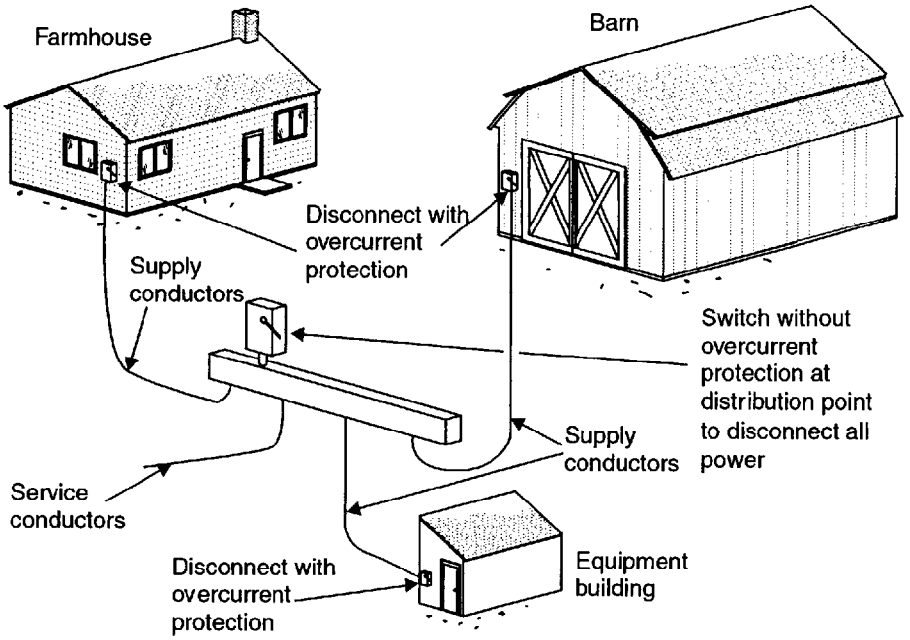

Figure 3. Disconnecting Means at Distribution Point. Note: All grounding to comply with 547-8(c)

Application

Three basic arrangements for distribution of power to groups of agricultural buildings from a distribution point are recognized in Section 547-8. The three arrangements are shown in the three illustrations. These arrangements are intended to provide a common disconnecting point for this type of multibuilding complex and to address the grounding concerns inherent to multiple grounding points.

Figure 1 corresponds to Section 547-8(a). In this case, the service disconnect and service overcurrent devices are located at one of the buildings. A feeder is extended from the service to a distribution point. The distribution point in turn feeds two additional buildings. An additional disconnecting means is required at the distribution point for each of the buildings that is fed from that location. A disconnecting means may be one or more disconnects. Grounding of the service equipment at the farmhouse must meet the regular requirements of Section 250-24.

Figure 2 corresponds to Section 547-8(b). While this example shows the service disconnecting means and overcurrent device(s) located at the distribution point. Feeders extend from the distribution point to the individual buildings. Separate disconnects are then provided at each building in accordance with Section 225-31, and grounding at the separate buildings is in accordance with 250-32.

Figure 3 corresponds to Section 547-8(c). While the first two arrangements discussed above fall under established rules in the code, the third arrangement represents a new rule. (This new rule is similar to 547-8(a) Exception No. 1 in the 1996 NEC but is different in a few respects. See the discussion under Background and Explanation.) In this case, a main disconnect suitable for use as service equipment is installed without overcurrent protection at the distribution point. A disconnecting means with overcurrent protection is installed at each building. Bonding jumpers may not be installed between the grounding electrodes and the grounded conductors at the separate buildings. In addition, five other requirements must be met:

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:11 2005

1. All buildings and premises wiring must be under single management.
2. The disconnecting means must be suitable for use as service equipment even though it does not include overcurrent devices.
3. An equipment grounding conductor must be run with the supply conductors to each building, and the size of each equipment grounding conductor must be equivalent to the largest supply conductor to each building or is adjusted in size according to Table 250-122 where constructed of a different material than the supply conductors.
4. The equipment grounding conductor must be bonded to the grounded conductor at the distribution point.
5. A grounding electrode system must be provided at each building and must be bonded to the equipment grounding conductor at each building disconnect.

Background and Explanation

The first two arrangements outlined in this new rule are not new at all. They both fall under existing rules of the code. Although much of what is now in Section 547-8(c) was previously in Section 547-8(a), Exception No. 1, significant changes were made in this third arrangement. The changes in language have created some important differences from the previous rules of the code and some variations from common practices.

One significant difference can be seen by attempting to label the conductors in Figure 3 using defined terms for conductors. Service conductors end at a "service disconnect" by definition. However, according to the definitions of feeders and service equipment, feeders are those conductors between the "service equipment" and the branch-circuit overcurrent devices, and service equipment normally includes overcurrent devices in the form of circuit breakers or fuses. The switch at the distribution point described in this section is considered to be a premises supply disconnecting means, but overcurrent protection is not required at this location, therefore it is not considered to be the service disconnecting means. The conductors between the distribution point and the building disconnects are not service conductors, and they don't quite match the usual definition of feeders either. However, these supply conductors do fit the description of "outside taps of unlimited length" as described in Section 240-21(b)(5).

Another issue is in the variations in equipment requirements. Although the distribution point disconnect must be suitable for use as service equipment, it is not required to provide overcurrent protection. Section 230-91 requires the service overcurrent protection to be a part of the service disconnect or located immediately adjacent to it. Also, a common practice has been to use pole-top switches as the distribution point disconnecting means, but such switches are not listed as being "suitable for use as service equipment."

According to Section 90-3, Article 547 may modify the requirements of Chapters 1 through 4. However, the new rules of Section 547-8(c) are unique to agricultural buildings, so they should be carefully reviewed with the authority having jurisdiction to ensure compliance with local interpretations.

Wed Feb 02 02:32:12 2005

547-9(a) & (b) Equipotential Plane

Type of Change Revision

BRIEF SUMMARY

Agricultural buildings. Requirements for equipotential planes have been clarified.

Code Language

547-9. **Bonding and Equipotential Plane.**

(a) Definition of Equipotential Plane. An area accessible to livestock where a wire mesh or other conductive elements are embedded in concrete, are bonded to **all metal structures and fixed nonelectrical metal equipment that may become energized** and are connected to the electrical grounding system to prevent a difference in voltage from developing within the plane. **For this section, livestock does not include poultry.**

(b) General. Wire mesh or other conductive elements shall be installed in the concrete floor of livestock confinement areas and be bonded to the building grounding electrode system to provide an equipotential plane that ~~has a~~ **may have** voltage gradient **ramps** at entrances and exits **that are traversed daily by the same livestock.** The bonding conductor shall be copper, insulated, covered or bare, and not smaller than No. 8. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means.

Exception No. 1: An equipotential plane shall not be required where there is no electric service to the building nor metal equipment accessible to livestock that is likely to become energized.

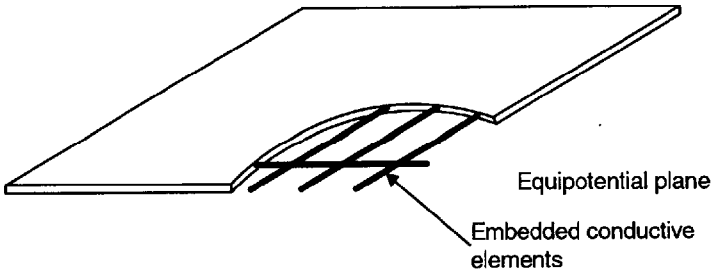
Exception No. 2: Slatted floors that are supported by structures that are a part of an equipotential plane shall not be required to be bonded.

FPN No. 1: A natural voltage gradient exists at the edge of an equipotential plane. Typically, voltage gradients exceeding 1 volt per foot at the edge of the equipotential plane will require a voltage gradient ramp.

FPN No. 2: Methods to establish equipotential planes and voltage gradient ramps are described in *Equipotential Planes in Animal Containment Areas,* American Society of Agricultural Engineers (ASAE) EP473-1997.

FPN No. 3: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:12 2005



Equipotential Plane in Agricultural Buildings with Livestock

Application

New Exception No. 1 clarifies that equipotential planes are not necessary if stray voltage cannot be encountered. New Exception No. 2 clarifies that slatted floors that are supported by the equipotential plane do not require additional bonding. Three new FPNs were added to provide information on equipotential planes.

Background and Explanation

This revision is intended to clarify where equipotential planes are required and how they should be installed. One of the concerns expressed to the panel addressed livestock buildings in which the livestock are born and raised in the same building (but do not leave) and are not exposed to gradient ramps or entrances and exits. Generally these buildings have steel embedded in the concrete (many are slatted floor construction) and making field connections to the reinforcing steel through the concrete exposes the steel to the severe corrosive environment common to this type of building.

Wed Feb 02 02:32:13 2005

547-9(c) GFCI Protection in Equipotential Plane Areas

Type of Change Revision

BRIEF SUMMARY

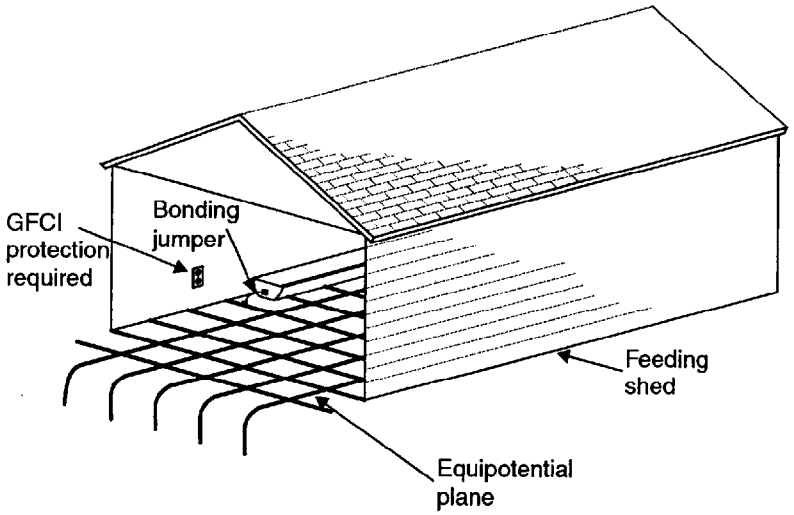
Agricultural buildings. GFCI protection is required for receptacles in equipotential plane areas.

Code Language

547-9. Bonding and Equipotential Plane.

•
•
•

(c) Receptacles. All 125-volt, single-phase, 15- and 20- ampere general purpose receptacles in areas having an equipotential plane shall have ground-fault circuit-interrupter protection for personnel. (ROC 19-15)



Receptacles in Equipotential Plane Areas

Application

The illustration shows an agricultural building with an equipotential plane and metal equipment bonded to the equipotential plane. The 15- or 20-ampere, 125-volt receptacle installed in the area of the equipotential plane must be GFCI protected.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:13 2005

Background and Explanation

The conditions in livestock buildings are much like those in other locations where GFCI protection is required by the code for 15- and 20-ampere, 125-volt receptacles. The livestock area is likely to be wet or damp, and, because of the equipotential plane, personnel are likely to be in contact with grounded objects or surfaces when using portable electric tools or appliances. The substantiation for this new requirement cited several electric shock incidents that have occurred in these areas.

550-2 & 550-23(a) & (b) Revised Definition of Manufactured Home; Requirements for Mobile and Manufactured Homes

NEC pp. 399 & 406

Type of Change Revision

BRIEF SUMMARY

Mobile and manufactured homes. The definition of "manufactured home" is clarified. Service location requirements have been modified.

Code Language

550-2. Definitions.

•
•
•

Manufactured Home. A factory-assembled structure or structures **that bears a label identifying it as a manufactured home that is transportable** in one or more sections, that is built on a permanent chassis and designed to be used as a dwelling with or without a permanent foundation ~~acceptable to the authority having jurisdiction~~ where connected to the required utilities, and that includes the plumbing, heating, air-conditioning, and electrical systems contained therein. (ROP 19-47) (ROC 19-16)

FPN No. 1: See the applicable building code for definition of the term *permanent foundation.*

FPN No. 2: See Part 3280, *Manufactured Home Construction and Safety Standards,* of the federal Department of Housing and Urban Development for additional information on the definition.

For the purpose of this *Code* and unless otherwise indicated, the term *mobile home* includes manufactured homes. (ROP 19-47)

550-23. Service Equipment.

(a) Mobile Home Service Equipment. The mobile home service equipment shall be located adjacent to the mobile home and not mounted in or on the mobile home. The service equipment shall be located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves. The service equipment shall be permitted to be located elsewhere on the premises, provided that a disconnecting means suitable for service equipment is located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves. Grounding at the disconnecting means shall be in accordance with Section 250-32.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:14 2005

(b) Manufactured Home Service Equipment. The manufactured home service equipment shall be permitted to be installed in or on a manufactured home, provided that all of the following conditions are met.

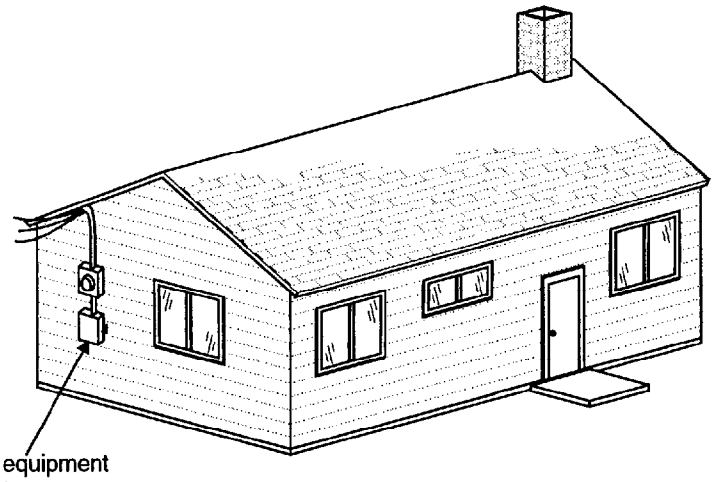
(1) The manufactured home is secured to a permanent foundation that complies with applicable building codes.

(2) The service equipment is installed in a manner acceptable to the authority having jurisdiction.

(3) The installation of the service equipment complies with Article 230.

(4) Means are provided for the connection of a grounding electrode conductor to the service equipment and routing it outside the structure.

(ROP 19-68a)



Manufactured Home Services

Application

Mobile homes and manufactured homes are similar in appearance. The revised definition makes it clear that a manufactured home bears a label identifying it as a manufactured home. Section 550-23(a) prohibits the mounting of a service on a mobile home. Section 550-23(b) allows the service to a manufactured home to be mounted on the home in controlled situations.

Background and Explanation

The definition was revised for clarity. The new definition helps the user to distinguish between the service rules in Sections 550-23(a) and (b). By specifically addressing each type of construction, the code has delineated where it is permitted to attach the service equipment to the structure and where it is necessary to provide a pedestal (or similar supply structure) detached and within 30 feet.

NEC pp. 402 & 423

550-8(g) & 552-41(d) Circuit Requirements for Heat Tape GFCI Protection

Type of Change Revision

BRIEF SUMMARY

Residential. Outlets for "heat tape" on mobile homes and park trailers must be connected to an interior GFCI protected circuit.

Code Language

550-8. Receptacle Outlets.

•
•
•

(g) Pipe Heating Cable Outlet. Where a pipe heating cable outlet is installed, the outlet shall be as follows:

(1) Located within 2 ft (610 mm) of the cold water inlet

(2) Connected to an interior branch circuit, other than a small appliance branch circuit. It shall be permitted to utilize a bathroom receptacle circuit for this purpose (ROP 19-57) (ROC 19-19a)

(3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter protection for personnel (ROP 19-57)

(4) Mounted on the underside of the mobile home and shall not be considered to be the outdoor receptacle outlet required in Section 550-8(e).

552-41. Receptacle Outlets Required.

•
•
•

(d) Pipe Heating Cable Outlet. Where a pipe heating cable outlet is installed, the outlet shall be as follows:

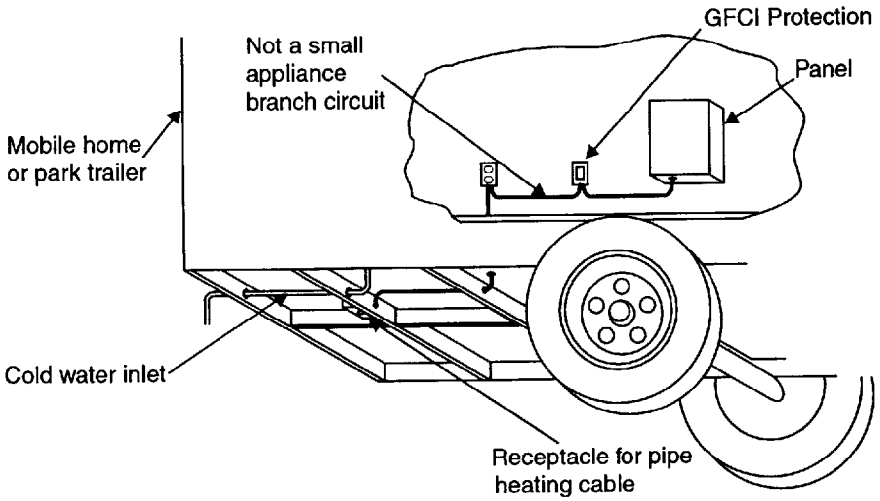
(1) Located within 2 ft (610 mm) of the cold water inlet

(2) Connected to an interior branch circuit, other than a small appliance branch circuit

(3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter protection for personnel

(4) Mounted on the underside of the park trailer and **shall not be considered to be the outdoor receptacle outlet required in Section 552-41(e)**

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:14 2005



Pipe Heating Cable Outlets

Application

Outlets for pipe heating cable on mobile homes and park trailers must be GFCI protected and the outlet must be connected to an interior branch circuit that is protected by a GFCI device. All outlets on the circuit must be GFCI protected. A GFCI-type circuit breaker or a GFCI device installed in the first outlet on the circuit could be used to protect all outlets. The circuit used may not be a small appliance branch circuit. However, Section 210-11(c)(3), which requires dedicated circuits for bathroom receptacles, is not applicable to park trailers (not a permanent dwelling unit) or to mobile homes (Section 550-8(g)(2) specifically permits connection to the bathroom circuit). Therefore the branch circuit supplying bathroom receptacles is permitted to supply the outlet for pipe heating cable. The "heat tape" outlet must be located within 2 feet of the cold water inlet to the park trailer or mobile home. The illustration shows a typical installation meeting the requirements of this rule.

Background and Explanation

These rules are more restrictive than the rule of Section 427-22 that requires ground-fault protection for equipment. GFCI protection was determined to be acceptable protection for pipe heating cable in mobile homes according to a study by the U.S. Consumer Product Safety Commission and Underwriters Laboratories. The length of heating cable involved in such installations is relatively short and the load relatively small, so overloading of circuits or nuisance tripping of GFCI devices is unlikely. The requirement that the outlet be on an interior circuit on which all other outlets are protected was added to increase the likelihood that a tripped GFCI device would be noticed by the occupant. Mobile homes and park trailers are similar to each other and different from recreational vehicles because both mobile homes and park trailers are likely to be "permanently" installed with connections to water piping. The term "pipe heating cable" was substituted for the less accurate term "heat tape."

Wed Feb 02 02:32:15 2005

551-41(c)(2) Exc. No. 3 Retractable Walls and GFCI Protection

Type of Change Revision; New Exception

BRIEF SUMMARY

Residential. De-energized receptacles that are within 6 feet of a sink only while retracted into travel mode need not be GFCI protected.

Code Language

551-41. Receptacle Outlets Required.

•
•
•

(c) Ground-Fault Circuit-Interrupter Protection. Where provided, each 125-volt, single-phase, 15- or 20-ampere receptacle outlet shall have ground-fault circuit-interrupter protection for personnel in the following locations:

•
•
•

(2) Where the receptacles are installed to serve the countertop surfaces, and are within 6 ft (1.83 m) of any lavatory or sink (ROP 19-101)

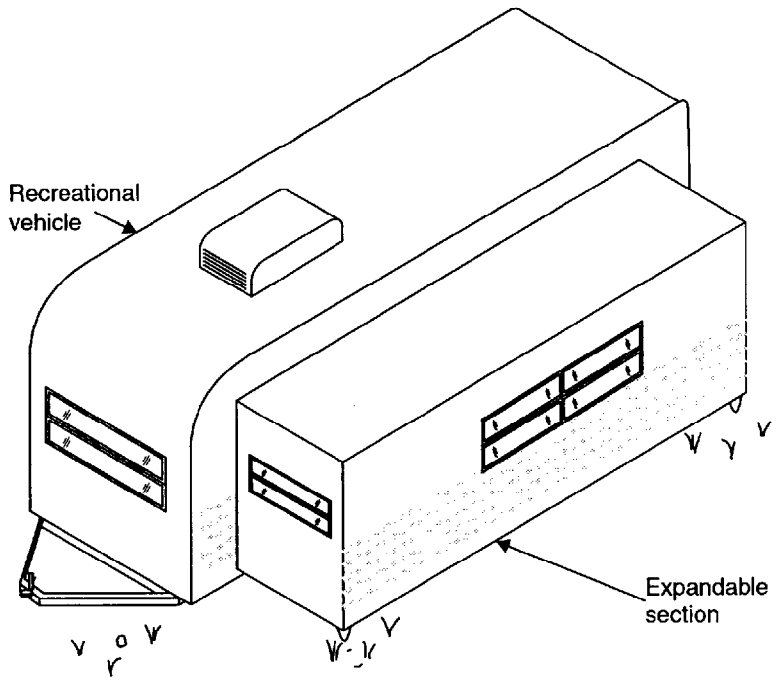
•
•
•

Exception No. 3: De-energized receptacles that are within 6 ft (18.3 m) of any sink or lavatory due to the retraction of the expandable room section. (ROP 19-100)

Application

Some recreational vehicles have sections that retract into a compact configuration for travel. Interior walls with receptacles may be retracted into a position that puts the receptacles within 6 feet of a sink while in the travel mode. Such de-energized receptacles are not required to have GFCI protection.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:15 2005



Recreational Vehicle with Retractable Wall Section

Background and Explanation

Although the substantiation stated that receptacles could be energized while in the retracted position, the panel action exempts such receptacles only if they are de-energized. Thus, a receptacle that is energized and within 6 feet of a sink while in the retracted position is not exempted from the GFCI requirement.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:16 2005

551-60(b) Testing of Low-Voltage Wiring Systems

Type of Change Revision

BRIEF SUMMARY

Recreational vehicles. Factory testing requirements have been revised.

Code Language

551-60. Factory Tests (Electrical). Each recreational vehicle shall be subjected to the following tests.

•
•
•

(b) Low-Voltage Circuits. An operational test of all low-voltage circuits shall be conducted to demonstrate that all equipment is connected and in electrical working order. **This test shall be performed in the final stages of production after all** ~~The test shall be permitted on running light circuits before the lights are installed provided the vehicle's~~ outer coverings and cabinetry have been secured. (ROP 19-117) (ROC 19-32a) (TCC 19-32a)

Background and Explanation

Section 551-60(b) has been revised based on the testing requirements found in Section 550-12(b)(2) for mobile homes. Specific parameters for duration and voltage level of the testing was removed based on a substatiation that the materials (90°C and 125°C) insulation used for the low-voltage wiring systems in today's recreational vehicles are much safer than wiring systems used in older models. The only test required is a functional test.

551-72 Three-Phase Distribution Systems in RV Parks

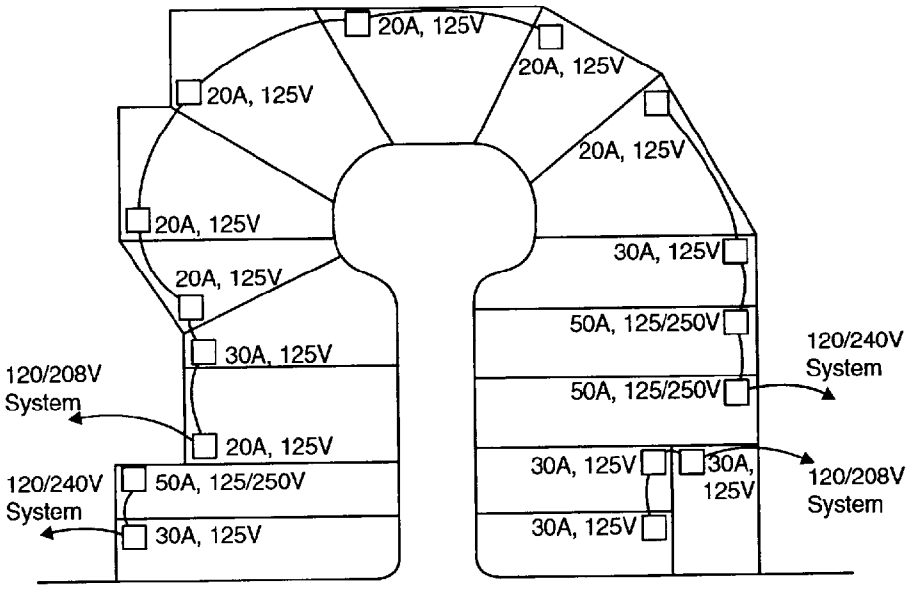
Type of Change Revision

BRIEF SUMMARY

Recreational vehicles. RV sites with 20- and 30-ampere, 120-volt receptacles are not required to be supplied by only 120/240-volt, single-phase systems.

Code Language

551-72. Distribution System. The recreational vehicle park secondary electrical distribution system to 50-ampere recreational vehicle sites shall be derived from a single-phase, 120/240-volt, 3-wire system. **Other recreational vehicle sites with 125-volt, 20- and 30-ampere receptacles may be derived from any grounded distribution system that supplies 120-volt single-phase power.** The neutral conductors shall not be reduced in size below the size of the ungrounded conductors for the site distribution. The neutral conductors shall be permitted to be reduced in size below the minimum required size of the ungrounded conductors for 240-volt, line-to-line, permanently connected loads only. (ROP 19-123)



RV Park Power Distribution

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:16 2005

Application

The illustration shows a portion of a recreational vehicle park. Those sites served by 50-ampere receptacles are required to be derived from a 120/240-volt, single-phase system. Other sites with 20- or 30-ampere receptacles may be derived from other grounded systems that supply 120-volt power.

Background and Explanation

According to Section 551-71, the receptacles used at recreational vehicle sites are to be 20 or 30 ampere, 125 volt, or 50 ampere, 125/250 volt. Thus, the 20- or 30-ampere sites can be supplied by any system that delivers 120-volt grounded circuits and 120/208-volt, single- or 3-phase systems can be used to meet the requirements of the 20- and 30-ampere sites. On the other hand, only 120/240-volt systems can be used to supply the proper voltages for the 50-ampere sites. The 50-ampere circuits supply equipment, such as air conditioners that are designed to operate at 240 volts. A 208-volt supply will not permit the equipment to operate properly.

This change would allow an entire site to be served by a 120/208-volt 3-phase system. Separately derived systems could be used to supply the 120/240-volt power to the 50-ampere sites. This permits a significant degree of design flexibility in supplying power to the RV sites as well as the other buildings and facilities that are sometimes included in RV parks. According to the substantiation for this proposal, 3-phase systems have sometimes been denied for entire parks based on the previous wording of this rule.

NEC pp. 420 & 424

551-80(b) & 552-43(c) Liquidtight Flexible Nonmetallic Conduit

Type of Change Revision

BRIEF SUMMARY

Recreational vehicles and park trailers. Additional wiring methods for supplying RVs and park trailers are allowed.

Code Language

551-80. Underground Service, Feeder, Branch-Circuit, and Recreational Vehicle Site Feeder-Circuit Conductors.

•
•
•

(b) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, **liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit,** or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid nonmetallic conduit. All such protection shall extend at least 18 in. (457 mm) into the trench from finished grade. (ROP 19-128) (ROC 19-36)

552-43. Power Supply.

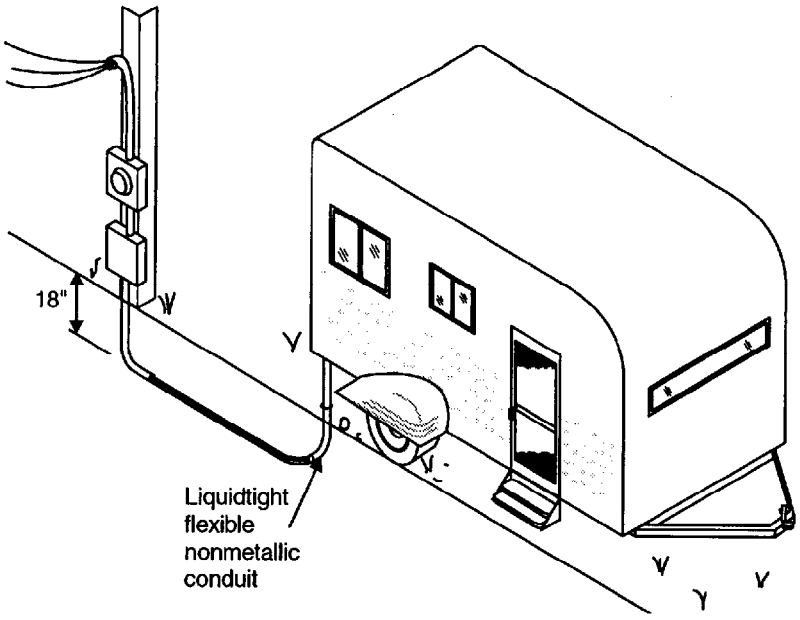
•
•
•

(c) Mast Weatherhead or Raceway. Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of one of the following:

(1) One mast weatherhead installation, installed in accordance with Article 230, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor; or

(2) A metal raceway, rigid nonmetallic conduit, **or liquidtight flexible nonmetallic conduit** from the disconnecting means in the park trailer to the underside of the park trailer, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the park trailer [with or without conductors as in Section 550-5(i)(1)] (ROP 19-142, 19-144)

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:17 2005



LFNMC for Supply to Park Trailer

Application

Section 551-80(b) now permits the use of liquidtight flexible nonmetallic conduit or liquidtight flexible metal conduit for protection of supply conductors to recreational vehicle sites. This protection is required where direct-buried conductors are brought above ground to supply electrical equipment at recreational vehicle sites. These methods are permitted where the conductors are not subject to physical damage.

Section 552-43(c)(2) has been revised to allow the use of liquidtight flexible nonmetallic conduit as a wiring method from the interior disconnecting means to the underside of the park trailer. A transition method using either a box or fitting is required at the underside of the unit for the connection to the supply wiring system.

Background and Explanation

These two sections have been expanded to permit additional wiring methods that will provide protection for conductors and allow some degree of flexibility.

Wed Feb 02 02:32:17 2005

552-43(a) Field-Installed Cord Caps

Type of Change Revision

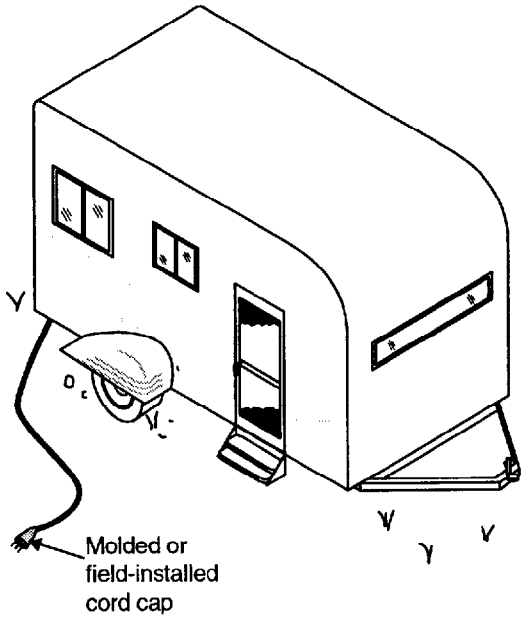
BREIF SUMMARY

Park trailers. Field-installed cord caps on power supply cords are allowed.

Code Language

552-43. Power Supply.

(a) Feeder. The power supply to the park trailer shall be a feeder assembly consisting of not more than one listed 30-ampere or 50-ampere park trailer power-supply cord with an integrally molded **or securely attached cap,** or a permanently installed feeder. (ROP 19-140)



Park Trailer Power Supply Cord

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:18 2005

Application

The power-supply cord for a park trailer may be equipped with a factory-installed or field-installed cord cap. Supply cords are usually furnished with a factory-installed molded cord cap. This revision provides for field-installed cord caps for new installations and replacement of damaged cord caps at existing installations.

Background and Explanation

This section for park trailer installations is now the same as the requirements in Section 550-5(a) for mobile home power cords.

Wed Feb 02 02:32:18 2005

555-4 Disconnecting Means for Shore Power to Boats

Type of Change New

BRIEF SUMMARY

Marinas. A circuit breaker or switch must be provided to disconnect a boat from its shore power supply.

Code Language

555-4. Disconnecting Means. A readily accessible disconnecting means shall be provided by which each boat can be isolated from its supply circuit. The disconnecting means shall consist of a circuit breaker or switch, or both, and shall be located within sight of the shore power connection and is intended to constitute the means of cutoff of the supply to the boat. (ROC 19-49)

Application

Disconnects in the form of circuit breakers or switches must be included in the shore power supplies for boats in marinas and boatyards. The disconnects are required to be readily accessible and within sight of the shore power connection to the boat. Each boat must be provided with such a disconnecting means. These disconnects are in addition to any disconnects provided in the form of a cord-and-plug connection.

Background and Explanation

This change reinforces the similar requirement in Section 3-15.2 of NFPA 303-1995 *Fire Protection Standard for Marinas and Boatyards*. Even though a receptacle may provide the shore power connection, the cord-and-plug connection may present a hazard to a person attempting to unplug the power supply cord in the wet environment of a marina or boatyard. A partially withdrawn attachment plug may expose a user to live parts. A switch or circuit breaker reduces the exposure of the user to live parts. Since users may be unfamiliar with the specific marina, the disconnect must be in sight of the power connection.

This rule was inserted as a new requirement. The previous Sections 555-4 through 555-10 have been renumbered as Sections 555-5 through 555-11.

Wed Feb 02 02:32:18 2005

600-6 Disconnecting Requirements for Signs

Type of Change Revision

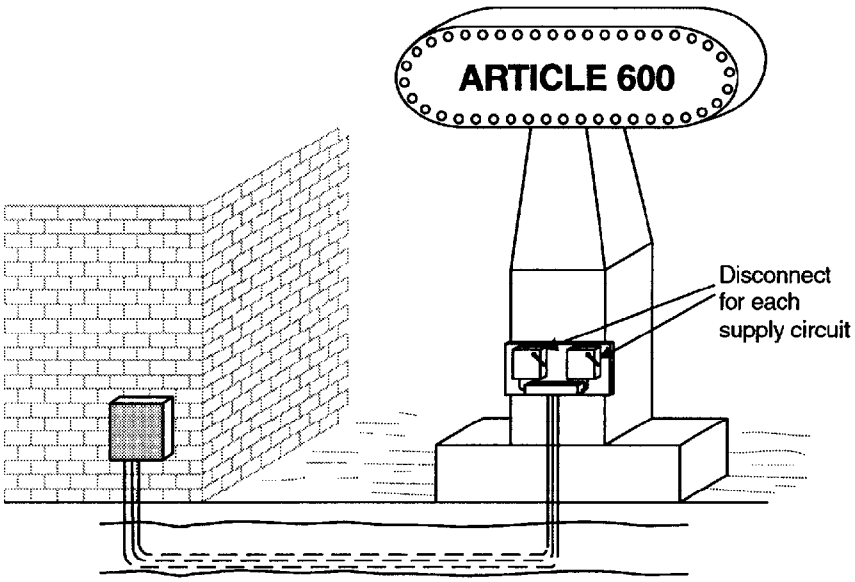
BRIEF SUMMARY

Signs. The requirement for disconnecting means at signs has been clarified.

Code Language

600-6. Disconnects. Each sign and outline lighting system, **or feeder circuit or branch circuit supplying a sign or outline lighting system,** shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors. **Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with Section 680-12.**

(ROP 18-98, 18-101)(ROC 18-82a)



Disconnecting Means for Sign Circuits

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:19 2005

Application

Each feeder or branch circuit supplying a sign must be provided with a disconnect to disconnect all the ungrounded conductors. This disconnect must be within sight of the sign or it is permitted to be located not within sight of the sign provided that it is capable of being locked in the open position.

Background and Explanation

The 1996 NEC required a disconnect for each sign. Some signs are supplied by several circuits and some consist of several sign sections. This revision clarifies that the disconnect must disconnect the power supply and that a separate switch is permitted but not required for each section of a sign.

Wed Feb 02 02:32:19 2005

600-7 Sign Grounding Requirements

Type of Change Revision

BRIEF SUMMARY

Commercial. Grounding and bonding requirements for signs have been extensively revised.

Code Language

600-7. Grounding. Signs and metal equipment of outline lighting systems shall be grounded. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary wiring of a transformer or power supply for use with electric discharge tubing shall be permitted as a **bonding means in lengths not exceeding 100 ft (30.5 m). Small metal parts not exceeding 2 in. (50.8 mm) in any dimension, not likely to be energized, and spaced at least ¾ in. (19 mm) from neon tubing shall not require bonding.** Where **listed** ~~flexible~~ nonmetallic conduit ~~or tubing~~ is used to enclose the secondary wiring of a transformer or power supply and a bonding conductor is required, the bonding conductor shall be **installed separate and remote from the nonmetallic conduit and be spaced at least 1½ in. (38 mm) from the conduit when the circuit is operated at 100 Hz or 1¾ in. (44.45 mm) when the circuit is operated at over 100 Hz. Bonding conductors shall be copper and not smaller than No. 14. Metal parts of a building shall not be permitted as a grounded or equipment grounding conductor.** (ROP 18-103) (ROC 18-89)

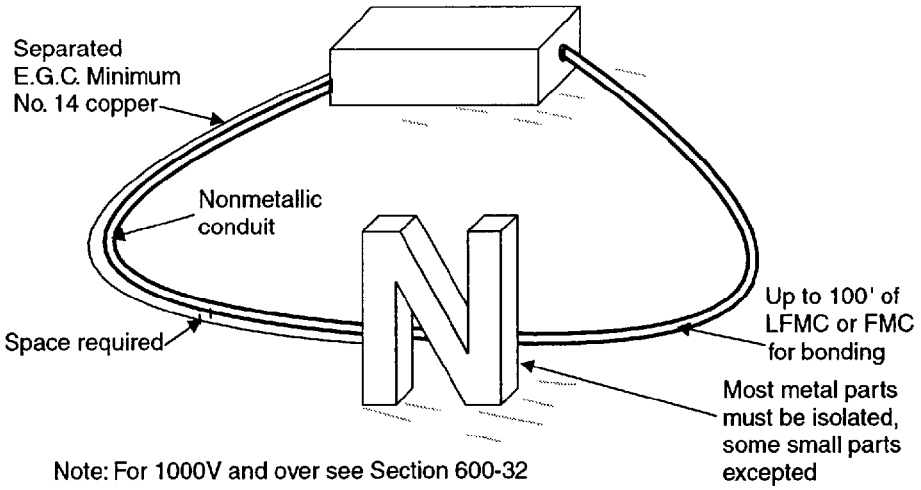
FPN: Refer to Section 600-32(j) for additional restrictions on length of high-voltage secondary conductors. (ROP 18-103) (ROC 18-89)

Application

The illustration depicts the changes made in this section. Up to 100 feet of liquidtight flexible metal conduit (LFMC) or flexible metal conduit (FMC) that contains the secondary wiring of a transformer or power supply may be used for bonding metal parts of signs that employ electric discharge tubing. Listed nonmetallic conduit (rigid nonmetallic conduit or liquidtight flexible nonmetallic conduit) may be used to enclose secondary wiring, but separate conductors must be used for parts requiring bonding. The separate bonding conductors must be copper and not smaller than No.14 AWG. Bonding conductors must be installed separately with spacings from nonmetallic conduits. The spacing must be at least 1½ inches when the frequency of the circuit is not over 100 hertz, and at least 1¾ inches when the frequency is over

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:19 2005

100 hertz. Metal parts of a building may not be used as grounded or grounding conductors. Isolated small metal parts less than 2 inches in any dimension and spaced ¾ inch or more from neon tubing are not required to be bonded.



Sign Wiring

Background and Explanation

Nine changes were made in this section:

1. Liquidtight flexible metal conduit was added as a bonding means.
2. FMC and LFMC up to 100 feet permitted for bonding.
3. "Grounding" changed to "bonding" for the use of flex.
4. Language about the suitability of flexible conduit connectors was deleted.
5. Bonding conductors must be copper and minimum size No.14.
6. Some small metal parts are excluded from bonding requirements.
7. Bonding conductors used with flexible nonmetallic conduit or tubing must be separated and spaced, with the spacing distance depending on frequency.
8. Metal parts of a building may not be used as grounded or grounding conductors.
9. An FPN calls attention to additional restrictions on the length of conductors and permitted wiring methods for secondaries over 1000 volts.

The 100-foot rule and the inclusion of LFMC as a bonding means are based on test data submitted for the 1993 NEC. Bonding is a more accurate and general term with regard to metal parts on the secondary of a sign transformer or power supply. The language about suitability of connectors was redundant, as the general rules of Chapters 1 through 4 already cover this issue. The rule about copper bonding conductors is intended to make it clear that aluminum is not suitable for this use. The language about small metal parts was restored after being inadvertently deleted from the 1993 code, and the specific 2-inch dimension of the parts was added for clarity. Where nonmetallic conduits are used, the required spacing of bonding conductors from the conduit is needed to reduce the deteriorating effects of corona and ozone on the nonmetallic conduit. No specific substantiation for the rule about buildings being used as conductors was provided, but the statement is almost self-evident and also appears in Section 600-32. Section 600-32 limits high-voltage secondary conductor lengths between power supplies and other sign parts to 20 feet in metallic conduits or tubing.

600-23(f) Marking of Supplies with Secondary Fault Protection

Type of Change New

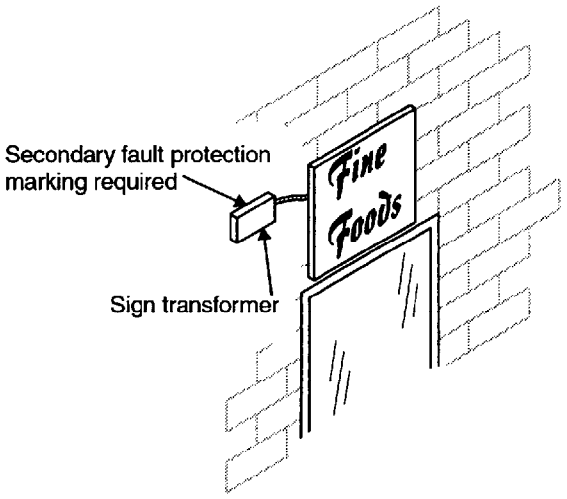
BRIEF SUMMARY

Signs. Secondary fault protection must be marked on sign transformers and power supplies.

Code Language

600-23. Transformers and Electronic Power Supplies.

(f) Marking. A transformer or power supply shall be marked to indicate that it has secondary fault protection. (ROP 18-118)



Marking of Transformers and Power Supplies

Application

Some sign transformers or electronic power supplies are provided with secondary fault protection. Marking of the transformer or power supply is required if the protection is supplied.

Background and Explanation

This marking will assist the inspector in determining that the power supply is code compliant.

600-32(a) Wiring Methods for Conductors Over 1000 Volts

Type of Change Revision

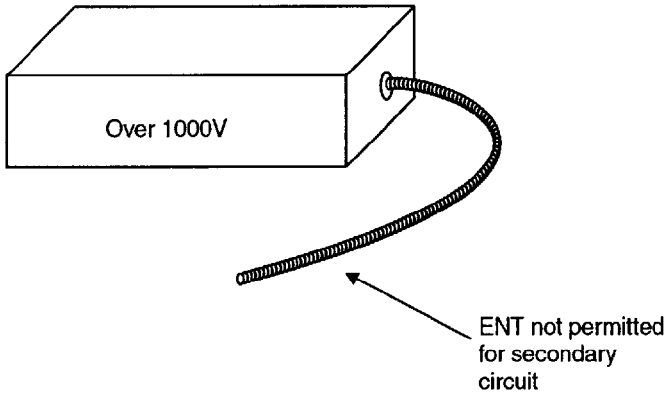
BRIEF SUMMARY

Commercial. Electrical nonmetallic tubing has been eliminated as a wiring method for secondary conductors over 1000V. Nonmetallic conduits are required to have spacing from grounded or bonded parts.

Code Language

600-32. Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal.

(a) Wiring Method. Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, ~~electrical nonmetallic tubing~~, metal enclosures, or other equipment listed for the purpose. **Wiring methods shall be installed in accordance with the requirements of Chapter 3.** Only one conductor shall be installed per length of conduit or tubing. **Nonmetallic conduit or flexible nonmetallic conduit, when operated at 100 Hz or less, shall be spaced at least 1½ in. (38 mm) from grounded or bonded parts; and, when operated at over 100 Hz, shall be spaced at least 1¾ in. (44.45 mm) from grounded or bonded parts.** Metal parts of a building shall not be used as a grounded or equipment grounding conductor. (ROP 18-122, 18-124)



Signs with Discharge Lighting Over 1000 Volts

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:20 2005

Application

As shown in the illustration, electrical nonmetallic tubing (ENT) is no longer permitted as a wiring method to enclose secondary conductors of discharge lighting systems over 1000 volts. In addition, where nonmetallic methods are used, they must be spaced from grounded or bonded metal parts. The required spacings are the same as for other nonmetallic conduits containing secondary conductors as outlined in Section 600-7. Conduits of any type are allowed to contain only one conductor.

Background and Explanation

Because conduits are allowed to contain only one conductor, when rigid nonmetallic conduit or liquidtight flexible nonmetallic conduit are used and any sign parts are required to be bonded, the bonding conductor(s) must be run outside of and be separated from the nonmetallic conduit. To quote from the code panel: "The problem encountered with nonmetallic conduit is the inability of the insulation on GTO cable to withstand the electromagnetic stresses created when it comes in close proximity to a grounded surface. The new spacing requirements are considered by CMP 18 as an interim solution to allow time for development of suitable GTO cable and related product safety standards. ENT was deleted because experience has shown that it is too flexible to be able to maintain the specified spacing between itself and a grounded plane."

604-6(a)(1) & (2) Exc. No. 3 Flexible Cord for Equipment Transitions

Type of Change New

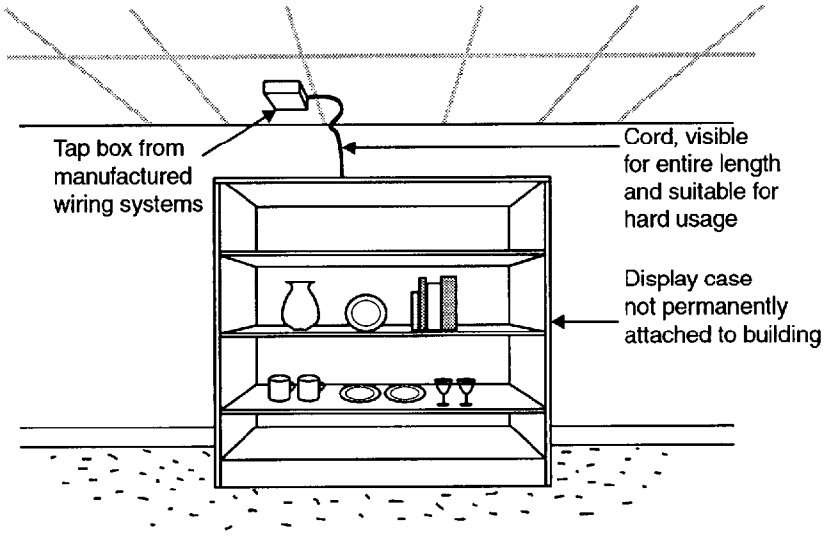
BRIEF SUMMARY

Commercial. Flexible cord is permitted for transitions to equipment from manufactured wiring systems.

Code Language

604-6. Construction.
(a) Cable or Conduit Types.
•
•
•

Exception No. 3 to (1) and (2): Flexible cord suitable for hard usage, with minimum No. 12 conductors, shall be permitted as part of a listed factory-made assembly not exceeding 6 ft (1.83 m) in length when making a transition between components of a manufactured wiring system and utilization equipment, not permanently secured to the building structure. The cord shall be visible for its entire length and shall not be subject to strain or physical damage. (ROP 19-177) (ROC 19-167)



Flexible Cords and Manufactured Wiring Systems

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:21 2005

Application

The illustration shows an example of an application of this new exception. Nine conditions must be met for this exception to apply:

1. The conductor size must be No.12 or larger.
2. The cord must be suitable for hard usage.
3. The cord must be part of a listed factory assembly.
4. The cord must not exceed 6 feet in length.
5. The cord must be visible for its entire length.
6. The cord may not be subject to strain or physical damage.
7. The cord is used to make a transition between a manufactured wiring system and utilization equipment.
8. The cord may not supply receptacles. (Receptacles are not utilization equipment.)
9. The utilization equipment supplied must not be permanently secured to the building structure.

Background and Explanation

The substantiation for this proposal listed display cases, merchandise racks, and temporary work stations as intended uses of the new exception. Of the conditions listed above, the code panel added conditions 2, 3, 4, 8, and 9 to the original proposal. The additional conditions were added to protect the cords and prevent their use as a substitute for fixed wiring.

610-13(d) Crane and Hoist Control Circuit Conductors

Type of Change Revision

BRIEF SUMMARY

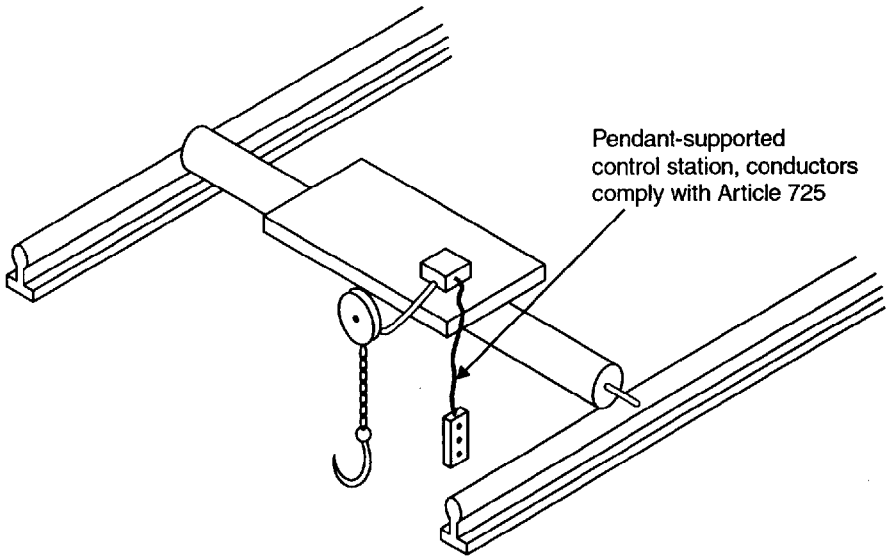
Industrial. Control circuit conductors for cranes and hoists may be selected from Article 725.

Code Language

610-13. Types of Conductors. Conductors shall comply with Table 310-13 **unless otherwise permitted in (a) through (d).**

•
•
•

(d) Conductors for Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits, installed in accordance with Article 725, shall be permitted. (ROP 12-39)



Control Circuit Wiring Methods

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:21 2005

Application

Section 610-13 was revised to eliminate three exceptions by changing them to positive code text. Section 610-13(d) was added, allowing the use of Article 725 for conductors in Class 1, Class 2, and Class 3 control circuits.

Background and Explanation

Conductor types permitted by Article 725, particularly Section 725-27(b), are not identified in Table 310-13. This change permits the use of any of the wiring methods from Article 725 to be used with Class 1, Class 2, and Class 3 circuits that are associated with cranes and hoists.

Wed Feb 02 02:32:21 2005

620-22(a) & (b) Elevator Car Lighting Overcurrent Device

Type of Change Revision

BRIEF SUMMARY

All elevators. The branch-circuit overcurrent devices for lighting, heating, and air-conditioning equipment on each car must be located in the elevator machine room or machinery space.

Code Language

620-22. Branch Circuits for Car Lighting, Receptacle(s), Ventilation, Heating, and Air Conditioning.

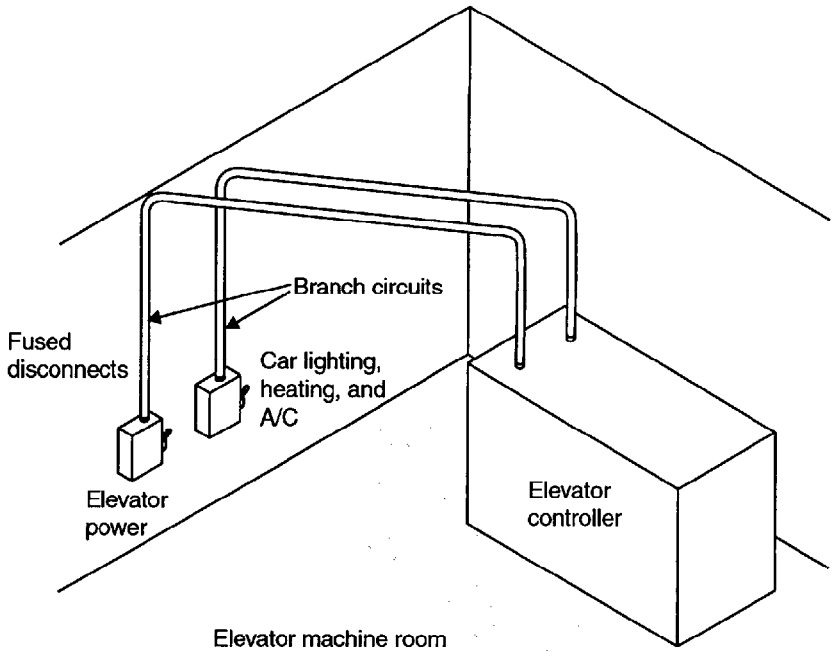
(a) Car Light Source. A separate branch circuit shall supply the car lights, receptacle(s), auxiliary lighting power source, and ventilation on each elevator car. **The overcurrent device protecting the branch circuit shall be located in the elevator machine room/machinery space.** (ROP 12-64)

(b) Air-Conditioning and Heating Source. A dedicated branch circuit shall supply the air-conditioning and heating units on each elevator car. **The overcurrent device protecting the branch circuit shall be located in the elevator machine room/machinery space.** (ROP 12-65)

Application

The illustration depicts an elevator equipment room with an elevator controller and two fused disconnects. One disconnect is for the elevator controller and drive motors, and the other is for the elevator car lighting, receptacles, ventilation, and heating and air conditioning. The fused disconnect for car lighting, etc. also serves as the branch circuit overcurrent devices for the same loads. Two dedicated branch circuits are required: one for car lighting, receptacles, and ventilation, and one for car heating and air conditioning. Branch-circuit overcurrent devices must be located in the machine room or machine space. Disconnects must be within sight of the equipment they serve and marked to indicate their use. Where two or more disconnects provide power to the same device, as shown in the illustration, warning signs must be provided in accordance with Section 620-52(b).

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:22 2005



Elevator Overcurrent Devices

Background and Explanation

Negative comments on this change claimed that the requirement to locate branch-circuit overcurrent devices in machine rooms would require distribution panels in the machine rooms or spaces. However, as shown in the illustration, fusible disconnects could serve as the branch-circuit overcurrent devices for the two dedicated circuits required. Circuit breakers are also suitable as the disconnecting means.

Sections 620-53 and 620-54 require a single means of disconnecting the car lighting, receptacles, and ventilation, and a single disconnecting means for the car heating and air conditioning. Nothing requires the two single disconnecting means to be separate disconnecting means, so one multipole fusible switch could serve as both required branch-circuit overcurrent devices and both required disconnects. A single disconnect is also required by Section 620-51 for the main power supply conductors. These new requirements for disconnecting means location harmonize with the Canadian Electrical Code, CAN-CSA C22.1-1994, Rule 38-012(3).

620-36 Fire Alarm Circuits in Elevator Traveling Cable

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Fire alarm conductors may be installed in a raceway or traveling cable with conductors of other types.

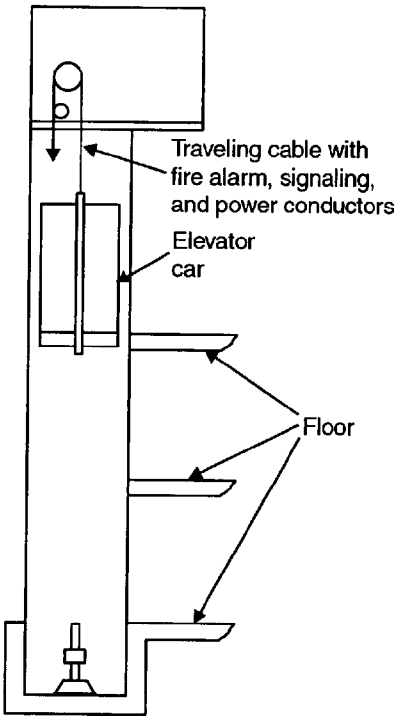
Code Language

620-36. Different Systems in One Raceway or Traveling Cable. Optical fiber cables and conductors for operating devices, operation and motion control, power, signaling, **fire alarm,** lighting, heating, and air-conditioning circuits of 600 volts or less shall be permitted to be run in the same traveling cable or raceway system if all conductors are insulated for the maximum voltage applied to any conductor within the cables or raceway system and if all live parts of the equipment are insulated from ground for this maximum voltage. Such a traveling cable or raceway shall also be permitted to include shielded conductors and/or one or more coaxial cables, if such conductors are insulated for the maximum voltage applied to any conductor within the cable or raceway system. Conductors shall be permitted to be covered with suitable shielding for telephone, audio, video, or higher frequency communications circuits. (ROP 12-68)

Application

This revision clarifies that power-limited and nonpower-limited fire alarm conductors are permitted in the same raceway or traveling cable as power and other types of signaling conductors for elevators. All power conductors, signaling conductors, and fire alarm conductors shall be insulated for the maximum voltage applied to any conductor in the raceway or cable. This permits all conductors associated with an elevator car to be contained within one raceway or traveling cable, instead of a group of raceways or cables. A single raceway or cable facilitates connection of the various systems that are necessary for elevator car operation.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:22 2005



Fire Alarm Circuits in Traveling Cables

Background and Explanation

The 1993 NEC allowed signaling conductors to be with other conductors in a raceway or traveling cable. The 1993 title for Article 760 was "Fire Alarm Signaling Systems." In this case, both remote control signaling from Article 725 and fire alarm signaling from Article 760 could be mixed with other circuits.

In the 1996 NEC the title of Article 760 was changed to "Fire Alarms." By the addition of "Fire Alarm" to Section 620-36 in the 1999 NEC, it again becomes clear that the intent is to allow these conductors to be mixed with others in elevator installations.

625-22 Personnel Protection Systems at Vehicle Charging Stations

Type of Change New

BRIEF SUMMARY

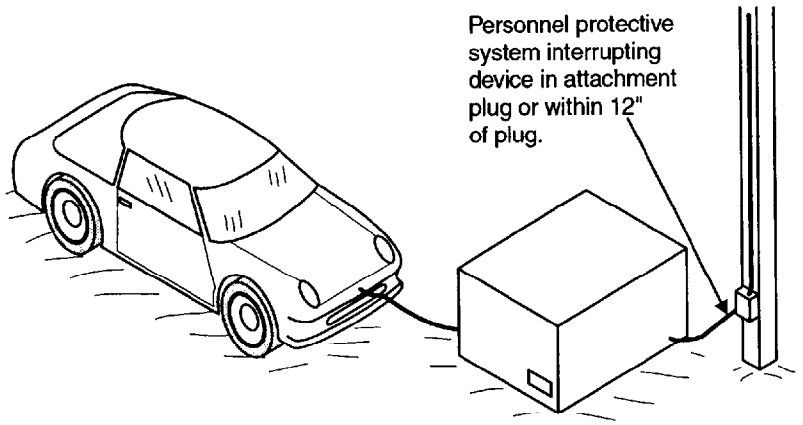
Residential and commercial. Personnel protection systems for electric vehicle charging systems replace GFCI devices for protection from shock.

Code Language

625-2. Definitions.

Personnel Protection System. A system of personnel protection devices and constructional features that when used together provide protection against electric shock of personnel. (ROC 12-42)

625-22. Personnel Protection System. The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel. **The personnel protection system shall be composed of listed personnel protection devices and constructional features. Where cord- and plug-connected electric vehicle supply equipment is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable not more than 12 in. (305 mm) from the attachment plug.** (ROP 12-90) (ROC 12-48)



Electric Vehicle Charger with Personnel Protective System

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:23 2005

Application

The illustration shows a vehicle charging system equipped with a personnel protective system. These systems are now required to replace what was called "ground-fault protection for personnel" in the 1996 NEC. These systems will provide protection equivalent to GFCI protection.

Background and Explanation

GFCI devices do not provide the range of options needed for the various types of charging systems being developed. Personnel protection systems are constructed of listed devices that provide protection from shock hazards. The devices used for these systems will vary somewhat, based on the voltages of the system. Devices or methods which may be used include basic insulation, double insulation, reinforced insulation, grounding monitors or insulation monitors with interrupters, charging circuit interrupting devices which monitor current differentials between charging circuit conductors, measurement indication units which measure leakage current, and centrally grounded systems with or without impedance limitation. Many combinations and variations of the above devices can be used to provide the personnel protection required. The product requirements for the listed systems are found in UL2331.

625-29(d)(3) Ventilation of Indoor Charging Locations

Type of Change New

BRIEF SUMMARY

Electric vehicles. This section provides an alternate method for determining ventilation levels.

Code Language

625-29. Indoor Sites. Indoor sites shall include, but not be limited to, integral, attached, and detached residential garages; enclosed and underground parking structures; repair and nonrepair commercial garages; and agricultural buildings.

•
•
•

(d) Ventilation Required. Where the electric vehicle supply equipment is listed or labeled as suitable for charging electric vehicles that require ventilation for indoor charging and marked in accordance with Section 625-15(c), mechanical ventilation, such as a fan, shall be provided. The ventilation shall include both supply and exhaust equipment and shall be permanently installed and located to intake from, and vent directly to, the outdoors. **Positive pressure ventilation systems shall only be permitted in buildings or areas that have been specifically designed and approved for that application.** Mechanical ventilation requirements shall be determined by one of the following methods. (ROP 12-93) (ROC 12-51) (TCC 12-51)

•
•
•

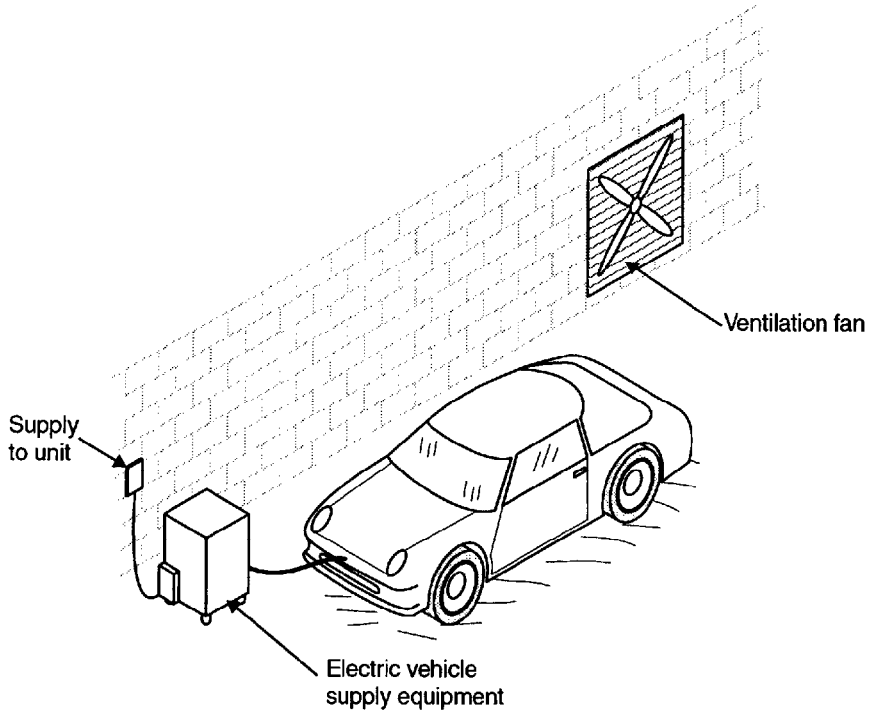
(3) For an electric vehicle supply equipment ventilation system designed by a person qualified to perform such calculations as an integral part of a building's total ventilation system, the minimum ventilation requirements shall be permitted to be determined per calculations specified in the engineering study. (ROP 12-93) (ROC 12-50, 12-51)

The supply circuit to the mechanical ventilation equipment shall be electrically interlocked with the electric vehicle supply equipment **and shall remain energized** during the entire electric vehicle charging cycle. Electric vehicle supply equipment, ~~receptacles and power outlets~~ shall be ~~clearly~~ marked **in accordance with Section 625-15. Electric vehicle supply equipment receptacles rated at 125 volts, single phase, 15 and 20 amperes shall be marked in**

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:24 2005

accordance with Section 625-15(c) and shall be switched and the mechanical ventilation system shall be electrically interlocked through the switch supply power to the receptacle. (ROP 12-93) (ROC 12-51)

For receptacles at each electric vehicle charging space identified "For Use with Electric Vehicles," and rated 125 volts, single phase, 15 and 20 amperes, such receptacles shall be switched, and mechanical ventilation shall be electrically interlocked through the switch supply power to the receptacle. (ROP 12-92)



Ventilation System for Charging Area

Application

The electric vehicle charging area is permitted to be ventilated by the building ventilation system. The ventilation system and the charging system must be interlocked to prevent charging if the ventilation is not operating. Where calculation of the ventilation requirements is performed, it must be done by a qualified person.

Background and Explanation

This change recognizes that interlocking of the charging and ventilation systems will prevent excessive buildup of hydrogen gas. Calculation by a qualified person helps to assure that adequate ventilation is provided.

Wed Feb 02 02:32:24 2005

Article 630 Part B & 630-11, 12 Welder Overcurrent Protection Requirements; Overcurrent Protection Device Calculation

NEC pp. 455–457

Type of Change Deletion and Revision

BRIEF SUMMARY

All Installations. Part C was deleted so that all arc welders are covered by Part B. Other Parts of Article 630 were relettered. Marking requirements were revised and overcurrent calculations were clarified.

Code Language

Part B. Arc Welders. (ROP 12-101)

630-11. Ampacity of Supply Conductors. The ampacity of conductors for ac transformer and dc rectifier arc welders shall be as follows. (ROP 12-95)

(a) Individual Welders. The ampacity of the supply conductors shall not be less than the I_{1eff} **value on the rating plate. Alternatively, if the** I_{1eff} **is not given,** the ampacity of the supply conductors shall not be less than the current value determined by multiplying the rated primary current in amperes given on the welder **rating plate** and the following factor based on the duty cycle of the welder. (ROP 12-95)

•
•
•

630-12. Overcurrent Protection. Overcurrent protection for arc welders shall be as provided in (a) and (b). Where the values as determined by this section do not correspond with the standard ampere ratings provided in Section 240-6 or the rating or setting specified results in unnecessary opening of the overcurrent device, the next higher standard rating or setting shall be permitted.

(a) For Welders. Each welder shall have overcurrent protection rated or set at not more than 200 percent **of** I_{1max}. **Alternatively, if the** I_{1max} **is not given, the overcurrent protection shall be rated or set at not more than 200 percent of the rated primary current of the welder.**

An overcurrent device shall not be required for a welder that has supply conductors protected by an overcurrent device rated or set at not more than 200 percent of I_{1max} **or the rated primary current of the welder.**

If the supply conductors for a welder are protected by an overcurrent device rated or set at not more than 200 percent of I_{max} **or rated primary current of the welder, a separate overcurrent device shall not be required.**

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:24 2005

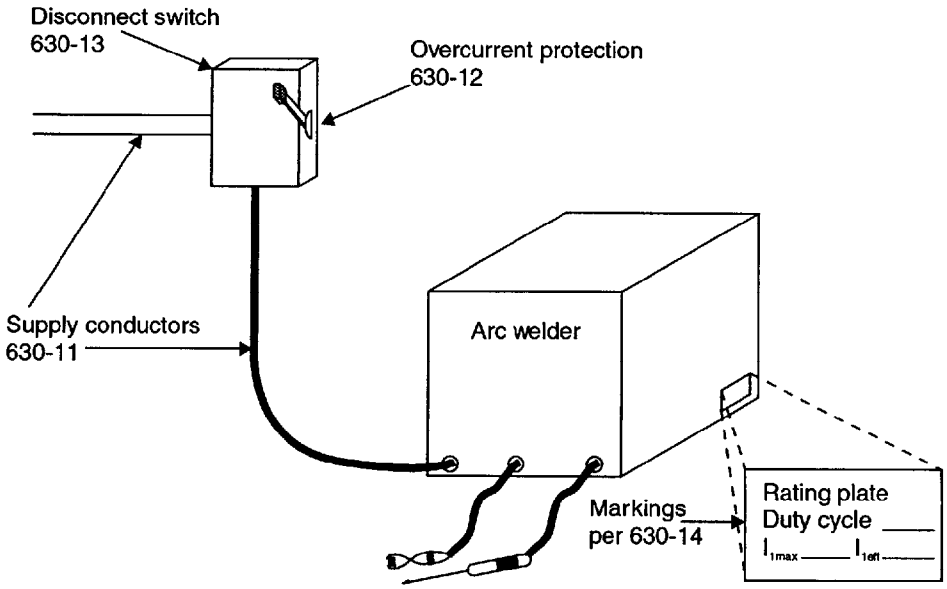
(b) For Conductors. Conductors that supply one or more welders shall be protected by an overcurrent device rated or set at not more than 200 percent of the conductor rating.

•
•
•

FPN: I_{1max} is the maximum value of the rated supply current at maximum rated output.

I_{1eff} is the maximum value of the effective supply current, calculated from the rated supply current (I_1), the corresponding duty cycle (duty factor) (X), and the supply current at no-load (I_0) by the following formula. (ROP 12-96)

$$I_{1eff} = \sqrt{I_1^2 X + I_0^2(1-X)}$$



Arc Welders

Application

The illustration lists Section 630-11 as the reference for sizing conductors for welders. According to Section 630-11, the ampacity of conductors supplying welders is based on the I_{1eff} rating on the welder rating plate. If the I_{1eff} rating is not available, the size of supply conductors to welders may be calculated. The calculation is done by selecting the appropriate factor from Section 630-12(a) based on the type of welder and the duty cycle of the welder. The selected factor is then multiplied by the primary current rating from the welder rating plate to determine the minimum ampacity of the supply conductors.

Section 630-12 is listed in the illustration as the reference for overcurrent protection of welders and conductors supplying welders. The maximum overcurrent device rating to protect the welder is 200 percent of I_{1max} if I_{1max} is listed on the rating plate. Otherwise, the maximum overcurrent device rating for welder protection is 200 percent of the primary current rating of the welder. The maximum overcurrent protection rating for supply conductors is 200 percent of the ampacity of the

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:25 2005

conductors. If the maximum value calculated for either welders or conductors is not equal to a standard size device listed in Section 240-6, the next higher standard rating may be used. A single overcurrent device may be used for both welder and conductor protection if the device protecting the conductors does not exceed the value required to protect the welder.

Background and Explanation

In order to consolidate the requirements for all arc welders, the table of factors in Section 630-11 includes a new line of multipliers for motor-generator arc welders. This additional line was taken from Section 630-21 in the 1996 code.

Obsolete terms and ratings such as "nameplate" and "1-hour duty cycle" were removed from Section 630-12, and the marking requirements in Section 630-14 have been revised to recognize current practice. The terms I_{1eff} and I_{max} have been added to the marking requirements. A new FPN includes a formula for I_{1eff}, which represents the effective heating value of the welder current. The value of I_{1eff} is preferred over the value derived from using the factors in Section 630-11, although the calculated value is still allowed. I_{max} is basically the same as the rated primary current.

The permission to increase the overcurrent device sizes in Section 630-12 has been changed. It is now based only on the calculation not producing a standard overcurrent device rating, not on whether the nearest standard rating is more or less than the calculated value. The requirement for disconnecting means in Section 630-13 has not changed significantly from the 1996 NEC.

NEC pp. 458–463

Article 640 Audio Equipment Requirements

Type of Change Revision

BRIEF SUMMARY

All occupancies. Extensive revisions have been made to clarify requirements and update the article for current industry equipment and practices.

Code Language

This article has been extensively revised. Refer to outline.

Article 640 — Audio Signal Processing, Amplification, and Reproduction Equipment

Part A. General
640-1. Scope.
640-2. Definitions.
640-3. Locations and Other Articles.
640-4. Protection of Electrical Equipment.
640-5. Access to Electrical Equipment Behind Panels Designed to Allow Access.
640-6. Mechanical Execution of Work.
640-7. Grounding.
640-8. Grouping of Conductors.
640-9. Wiring Methods.
640-10. Audio Systems Near Bodies of Water.

Part B. Permanent Audio System Installations
640-21. Use of Flexible Cords and Cables.
640-22. Wiring of Equipment Racks.
640-23. Conduit or Tubing.
640-24. Wireways, Gutters, and Auxiliary Gutters.
640-25. Loudspeaker Installation in Fire Resistance Rated Partitions, Walls, and Ceilings.

Part C. Portable and Temporary Audio System Installations
640-41. Multipole Branch-Circuit Cable Connectors.
640-42. Use of Flexible Cords and Cables.
640-43. Wiring of Equipment Racks.
640-44. Environmental Protection of Equipment.
640-45. Protection of Wiring.
640-46. Equipment Access.

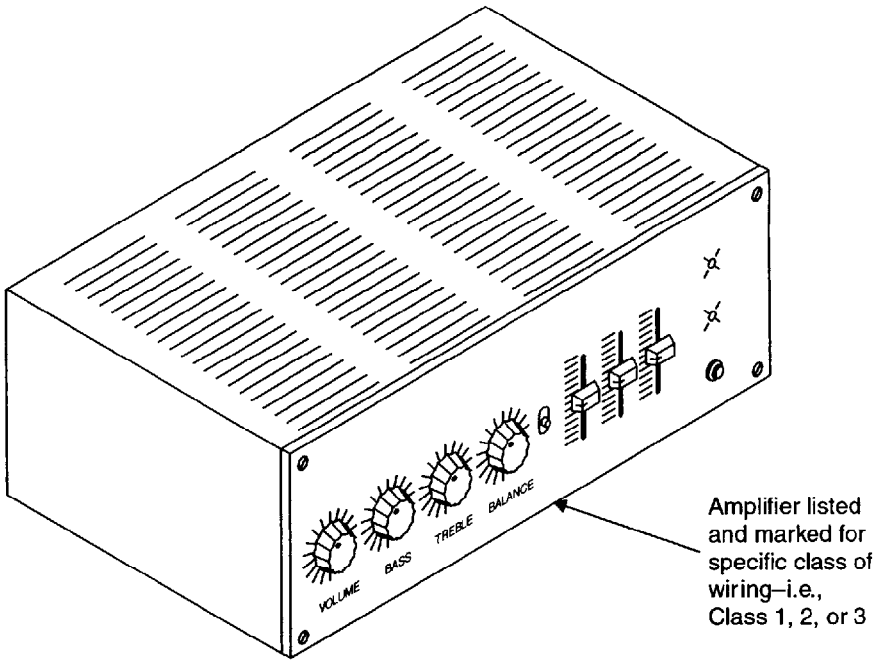
Wed Feb 02 02:32:25 2005



Audio System Equipment

Background and Explanation

Users of this article should thoroughly review the revisions. Out-of-date practices have been removed and new technology has been added to reflect current industry practices. The use of Class 1, Class 2, and Class 3 wiring methods with listed amplifiers that are marked for the specific class of wiring is permitted. The article also specifies separation requirements for audio circuits using different class wiring systems. New parts of the article cover temporary and permanent audio system installations.

More detailed coverage has been introduced to cover the variety of environments where equipment is used. Provisions have been made for safe grounding while reducing audible hum in system outputs.

NEC pp. 478–479

680-8 Overhead Conductor Clearances

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Two clearances from pools and pool structures to overhead conductors have been increased.

Code Language

680-8. Overhead Conductor Clearances.
See table.

Table 680-8. Clearances

	Insulated Supply or Service Drop Cables, 0–750 volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor	*All Other Supply or Service-Drop Conductors Voltage to Ground*	
		0–15kV	*Greater Than 15–50kV*
A Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	**22 ft (6.7 m)**	25 ft (7.62 m)	27 ft (8.23 m)
B Clearance in any direction to the diving platform or tower	14 ft (4.27 m)	**17 ft (5.2 m)**	18 ft (5.49 m)
C Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in (1) and (2) but not less than 10 ft (3.05 m).		

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:26 2005

Application

In the table, which corresponds to Figure 680-8 in the NEC, the dimension labeled "A" under the 0–750-volt column was changed to 22 feet from 18 feet. The dimension labeled "B" under the 0–15kV column was changed to 17 feet from 16 feet.

Background and Explanation

The clearances revised by this change were formerly under Section 680-8 Exception No. 1. In the 1999 code, Exception No. 1 along with Exception No. 2 were reworded into positive code language and the table became Table 680-8. The change in the required clearances was made primarily to harmonize the NEC with the National Electrical Safety Code (NESC).

680-12 Disconnecting Means for Pool, Spa, and Hot Tub Equipment

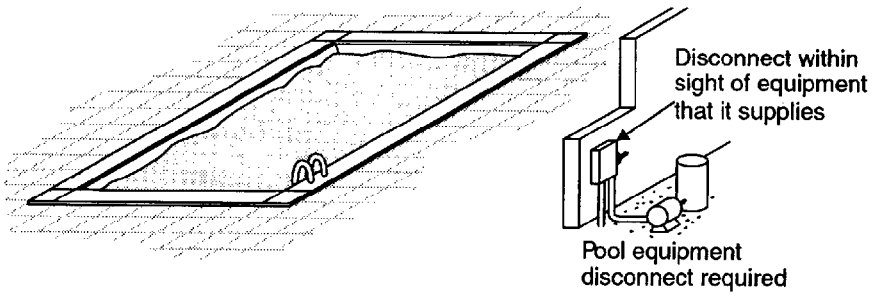
Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Requirements for disconnects at pools, spas, and hot tubs have been clarified.

Code Language

680-12. Disconnecting Means. **A** disconnecting means shall **be provided** and be accessible, located within sight from all pools, spas, and hot tub equipment, and shall be located at least 5 ft (1.52 m) from the inside walls of the pool, spa, or hot tub. (ROP 20-107)



Disconnecting Means for Associated Equipment

Application

An accessible disconnect must be installed within sight of pool, spa, or hot tub equipment. This requirement ensures that a disconnect is available to workers servicing pool, spa, and hot tub equipment such as motors, heaters, and lighting fixtures. The term "accessible," as defined in Article 100, requires that the disconnecting means provide "close approach" and not be guarded by locked doors, which preclude access by service personnel.

Background and Explanation

This section has been clarified to ensure that a disconnect is installed for the servicing of equipment. The 1996 NEC required a disconnect to be accessible, but it was not clear that one was required.

680-20(c) Liquidtight Flexible Nonmetallic Conduit for Dry-Niche Fixtures

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Liquidtight flexible nonmetallic conduit was added to the wiring methods permitted for dry-niche fixtures.

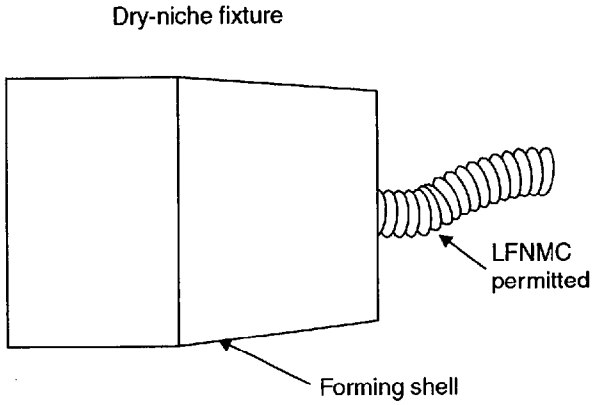
Code Language

680-20. Underwater Lighting Fixtures.

•
•
•

(c) Dry-Niche Fixtures. A dry-niche lighting fixture shall be provided with a provision for drainage of water and a means for accommodating one equipment grounding conductor for each conduit entry.

Approved rigid metal conduit, intermediate metal conduit, **liquidtight flexible nonmetallic conduit,** or rigid nonmetallic conduit shall be installed from the fixture to the service equipment or panelboard. Where installed on buildings, electrical metallic tubing shall be permitted to be used to protect conductors. Where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted to be used to protect conductors. A junction box shall not be required but, if used, shall not be required to be elevated or located as specified in Section 680-21(a)(4), if the fixture is specifically identified for the purpose.



Dry-Niche Fixture Wiring

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:27 2005

Application

As shown in the illustration, liquidtight flexible nonmetallic conduit (LFNMC) may now be used to wire dry-niche fixtures.

Background and Explanation

LFNMC was already listed in Section 680-20(b)(1) as an acceptable method of wiring wet-niche fixtures, and it is available listed for direct burial. It is now an acceptable method of wiring dry-niche fixtures.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:27 2005

680-21(a)(1) Listing of Junction Boxes for Pool Fixtures

Type of Change New

BRIEF SUMMARY

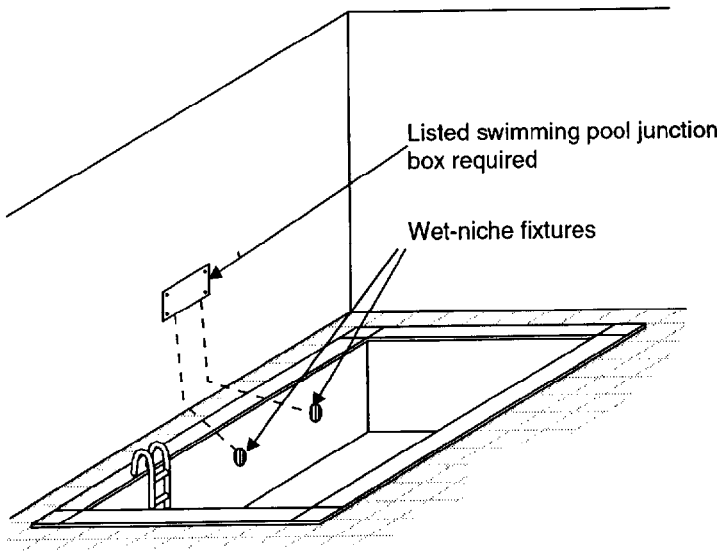
Residential and commercial. Listing of junction boxes connected to conduits that connect directly to the forming shell or mounting bracket of underwater lighting fixtures is required.

Code Language

680-21. Junction Boxes and Enclosures for Transformers or Ground-Fault Circuit Interrupters.

(a) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall be as follows.

1. Listed and labeled for the purpose. (ROP 20-122)



Junction Box for Pool Lighting Fixtures

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:28 2005

Application

Boxes used for the supply wiring to wet-niche and no-niche underwater lighting fixtures must be listed for the purpose by a recognized testing laboratory.

Background and Explanation

The requirement for a box that is listed for the purpose ensures that the integral grounding terminals needed for proper grounding and bonding of underwater lighting fixtures will be available. A box that is listed, but not specifically listed for use with swimming pools, may not provide the proper number of integral grounding and bonding terminals required by this section.

680-22 Purpose of Bonding at Swimming Pools

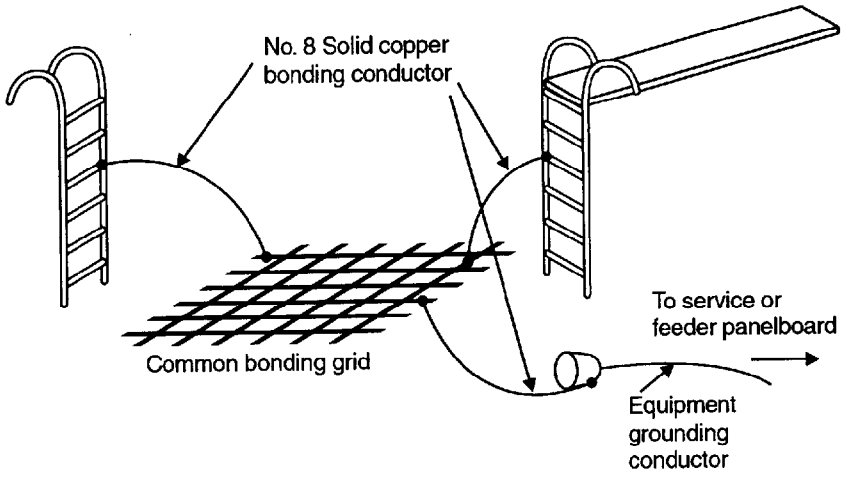
Type of Change Revision

BRIEF SUMMARY

Residential and commercial. The bonding conductors of Section 680-22 are not required to be extended to panelboards, electrodes, or service equipment.

Code Language

680-22. Bonding. It shall not be the intent of this section to require that the No. 8 or larger solid copper bonding conductor be extended or attached to any remote panelboard, service equipment, or any electrode, but only that it shall be employed to eliminate voltage gradients in the pool area as prescribed. (ROP 20-126)



Bonding at Swimming Pools

Application

As shown in the illustration, the No. 8 AWG bonding conductor is only intended to be used to bond metal parts of the pool together. A part like a metal forming shell of a fixture is required to be bonded by a No. 8 conductor as a metal part of the pool. It is also required to be grounded with respect to the electrical system supplying the light fixture. But the size of the equipment grounding conductor to the fixture may be smaller than No. 8 and is only required to be sized on the basis of the overcurrent device of the branch circuit. Section 680-25 does require

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:28 2005

most equipment grounding conductors to be a minimum No.12 AWG, but smaller conductors are permitted in some cases.

Background and Explanation

The 1996 code had a FPN that explained the intent of Section 680-22. The FPN was often interpreted as a code requirement because it explained the intent of the rule. Since FPNs are supposed to be advisory only, the intent statement was changed to code text, to make it more clearly a part of the rule.

As the revised rule now states, the No. 8 bonding conductor is intended only to eliminate voltage gradients in the pool area. It is not intended as a conductor of fault currents that might occur because of a problem in associated electrical equipment; nor does this section intend to require equipment grounding conductors to be No.8 or larger. Equipment grounding conductors to associated electrical pool equipment must be sized in accordance with Section 250-122 and 680-25. If the fixture in the illustration were a wet-niche fixture supplied by a flexible cord, Section 680-25(b)(5) would allow an equipment grounding conductor as small as No.16 in the cord. The bonding conductor size (No. 8 AWG minimum), material (copper), and construction (solid) provide for the mechanical integrity of the bonding conductor(s).

NEC p. 481

680-22(a)(1) Bonding Not Required for Epoxy-Covered Reinforcing Steel

Type of Change Revision

BRIEF SUMMARY

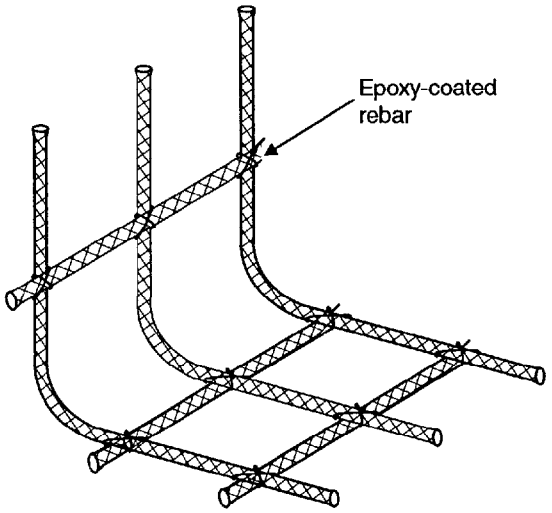
Residential and commercial. Bonding requirements for coated reinforcing steel have been clarified.

Code Language

680-22. Bonding.

(a) Bonded Parts. The following parts shall be bonded together.

(1) All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. **Where reinforcing steel is effectively insulated by a listed encapsulating nonconductive compound, at the time of manufacture and installation, it shall not be required to be bonded.** (ROC 20-115)



Reinforcing Steel Encapsulated by Listed Nonconductive Compound

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:29 2005

Application

Coated reinforcing steel may not provide the conductivity from piece to piece that is necessary to establish the required common bonding grid. Where the steel is effectively insulated by a listed compound during manufacture or installation, it will not form an effective bonding grid; therefore a bonding connection is not required.

Background and Explanation

This change recognizes the increased use of reinforcing steel that is epoxy coated for swimming pool structure and deck construction. The nonconductive coating is required to be listed, and the coating is to be installed at the time of manufacture or at the time of installation. The time of installation provision allows for repair of damage to the encapsulating compound that may have occurred between the point of manufacture and the point of installation.

Wed Feb 02 02:32:29 2005

680-22(b) Exothermic Welding for Bonding Connection

Type of Change Revision

BRIEF SUMMARY

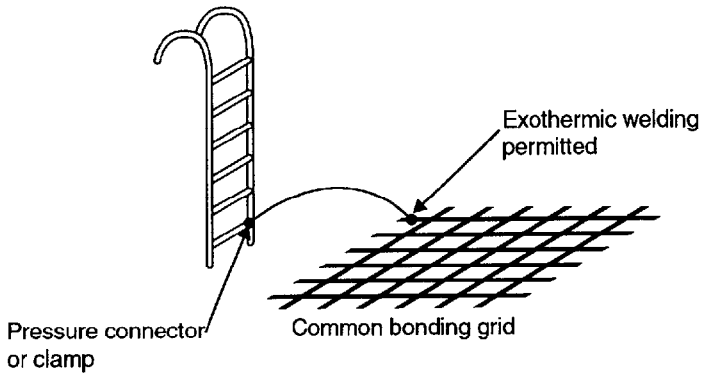
Residential and commercial. Exothermic welding has been added as an acceptable method of making bonding connections at pools. Other connection methods must be labeled for the purpose.

Code Language

680-22. Bonding.

•
•
•

(b) Common Bonding Grid. The parts specified in (a) shall be connected to a common bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than No. 8. Connection shall be made by **exothermic welding** or by pressure connectors or clamps that are labeled as being suitable for the purpose and are of the following material: stainless steel, brass, copper, or copper alloy. The common bonding grid shall be permitted to be any of the following: . . . (ROP 20-136)



Bonding Connections at Swimming Pools

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:30 2005

Application

The illustration shows a bonding jumper between a metal ladder and the rebar grid of a pool structure. The connections between the bonding jumper and the grid or ladder may be made by the exothermic welding process, or by pressure connectors or clamps. Pressure connectors or clamps must be labeled as suitable for the purpose.

Background and Explanation

Exothermic welding was explicitly recognized by this change. The change also clarifies the requirement for pressure connectors or clamps to be specifically labeled for the purpose. Connections in a pool area must be suitable for the wet conditions and the high levels of chlorine.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:30 2005

680-22(b)(4) Brass Conduit as Bonding Grid Component

Type of Change New

BRIEF SUMMARY

Residential and commercial. The use of metal conduits as part of the common bonding grid is permitted.

Code Language

680-22. Bonding.

•
•
•

(b) Common Bonding Grid. The parts specified in (a) shall be connected to a common bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than No. 8. Connection shall be made by exothermic welding or by pressure connectors or clamps that are labeled as being suitable for the purpose and are of the following material: stainless steel, brass, copper, or copper alloy. The common bonding grid shall be permitted to be any of the following: (ROP 20-136)

(1) The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent

(2) The wall of a bolted or welded metal pool

(3) A solid copper conductor, insulated, covered, or bare, not smaller than No. 8

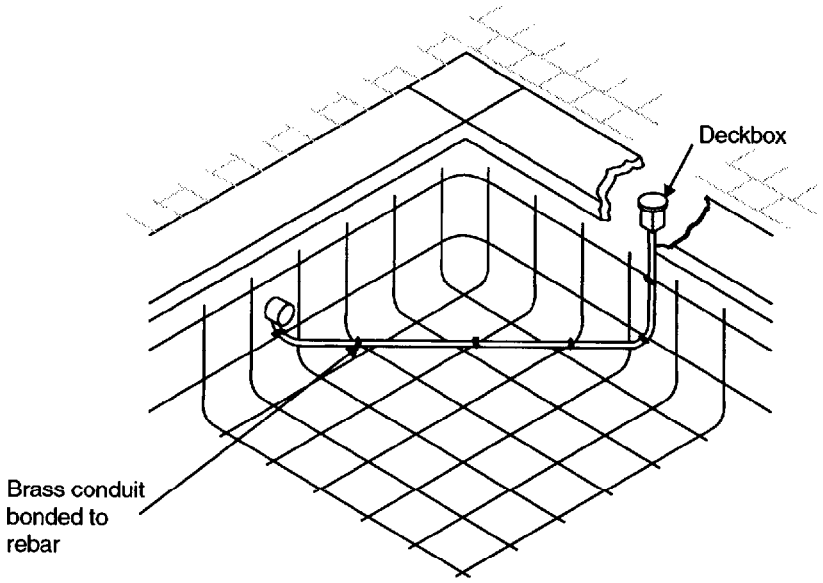
(4) **Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal conduit** (ROP 20-140)

Structural reinforcing steel or the walls of bolted or welded metal pool structures shall be permitted as a common bonding grid for nonelectrical parts where connections can be made in accordance with Section 250-8. (ROC 20-123)

Application

Brass or other corrosion-resistant conduit may be used to establish common bonding between reinforcing steel and items such as deck boxes or outlet boxes for pump motors. This provision eliminates the need to install separate bonding jumpers in some cases.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:30 2005



Brass Conduit as Bonding Grid

Background and Explanation

This change provides adequate bonding and recognizes that metal conduits provide an effective bonding path and can be used as part of the common bonding grid, particularly where installed aboveground and accessible. This method of bonding has been permitted by some authorities having jurisdiction.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:31 2005

680-25(d) Sizing Bonding Jumper

Type of Change Revision

BRIEF SUMMARY

Residential and commercial: Grounding requirements for panelboards and disconnects that are not part of the service have been clarified.

Code Language

680-25. Methods of Grounding.

(d) Panelboards. A panelboard **and, where installed, a disconnecting means,** that are not part of the service equipment or source of a separately derived system, shall have an equipment grounding conductor installed between its grounding terminal and the grounding terminal of the applicable service equipment or source of a separately derived system. This conductor shall be sized in accordance with Table 250-122 but not smaller than No. 12. **On separately derived systems, this conductor shall be sized in accordance with Table 250-66 but not smaller than No. 8.** It shall be an insulated conductor and shall be installed with the feeder conductors in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted to be used to protect conductors where installed on or within the building in accordance with Article 348. Electrical nonmetallic tubing shall be permitted to be used to enclose the conductors where installed within the building in accordance with Article 331. The equipment grounding conductor shall be connected to an equipment grounding terminal of the panelboard and, where installed, to the enclosure for a disconnecting means. (ROC 20-157, 20-158)

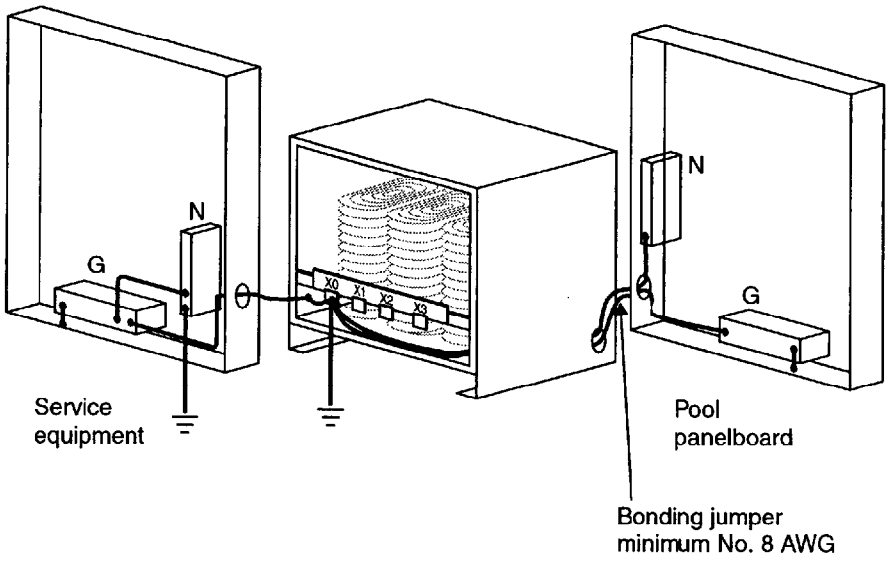
Application

Equipment grounding conductors for service supplied panelboards and disconnects are selected from Section 250-122 and Table 250-122 based on the rating of the overcurrent device. The minimum size is No. 12 AWG for panelboards that supply pool equipment.

Where the panelboard or disconnect is supplied from a separately derived system, this conductor is no longer referred to as an equipment grounding conductor. Between the source of the separately derived system and the first system disconnecting means the grounding and bonding conductor is defined as a bonding jumper and the size is selected from Section 250-66 and Table 250-66. In this

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:31 2005

case, the selection is based on the size of the ungrounded circuit conductors installed from the source of the separately derived system to the first system disconnecting means and the minimum size specified by Table 250-66 is No. 8 AWG. This bonding jumper is required to be an insulated conductor. The illustration shows only the grounding and bonding conductor connections and does not show the required raceway or wiring method between the enclosures.



Sizing of Bonding Jumper

Background and Explanation

Section 250-30(a)(1) specifies the use of Section 250-28(d) to size bonding jumpers for separately derived systems. Section 250-28(d) requires the use of Table 250-66 resulting in a minimum size of No. 8. In prior editions of the code, the sizing of the separately derived system bonding jumper was not covered by this section.

680-25(d) Liquidtight Flexible Nonmetallic Conduit for Pool Feeders

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Liquidtight flexible nonmetallic conduit is permitted as a wiring method for feeders to panelboards serving swimming pool equipment.

Code Language

680-25. Methods of Grounding.

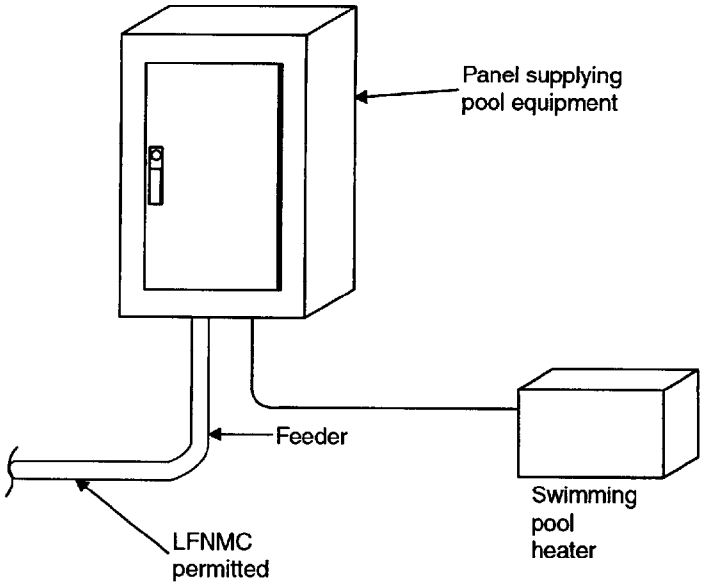
(d) Panelboards. A panelboard and, where installed, a disconnecting means, that are not part of the service equipment or source of a separately derived system, shall have an equipment grounding conductor installed between its grounding terminal and the grounding terminal of the applicable service equipment or source of a separately derived system. This conductor shall be sized in accordance with Table 250-122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250-66 but not smaller than No. 8. It shall be an insulated conductor and shall be installed with the feeder conductors in rigid metal conduit, intermediate metal conduit, **liquidtight flexible nonmetallic conduit,** or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted to be used to protect conductors where installed on or within the building in accordance with Article 348. Electrical nonmetallic tubing shall be permitted to be used to enclose the conductors where installed within the building in accordance with Article 331. The equipment grounding conductor shall be connected to an equipment grounding terminal of the panelboard and, where installed, to the enclosure for a disconnecting means.

(ROP 20-157)

Application

As shown in the illustration, liquidtight flexible nonmetallic conduit (LFNMC) may be used for enclosing feeders to a swimming pool panelboard.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:32 2005



Wiring of Swimming Pool Panelboards

Background and Explanation

LFNMC was already permitted for wiring of wet-niche fixtures and pool motors and is available listed for direct burial. This change was one of many that expanded the permitted uses of LFNMC. Equipment grounding conductors must be provided with the feeder unless the panelboard is in a separate building and grounding is in accordance with Section 250-32.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:32 2005

680-25(d)(2) Panelboard Grounding at Separate Building or Structure

Type of Change Revision

BRIEF SUMMARY

Residential and commercial. Swimming pool equipment may be fed from panelboards at separate buildings without equipment grounding conductors extending back to the service.

Code Language

680-25. Methods of Grounding.

•
•
•

(d) Panelboards.

•
•
•

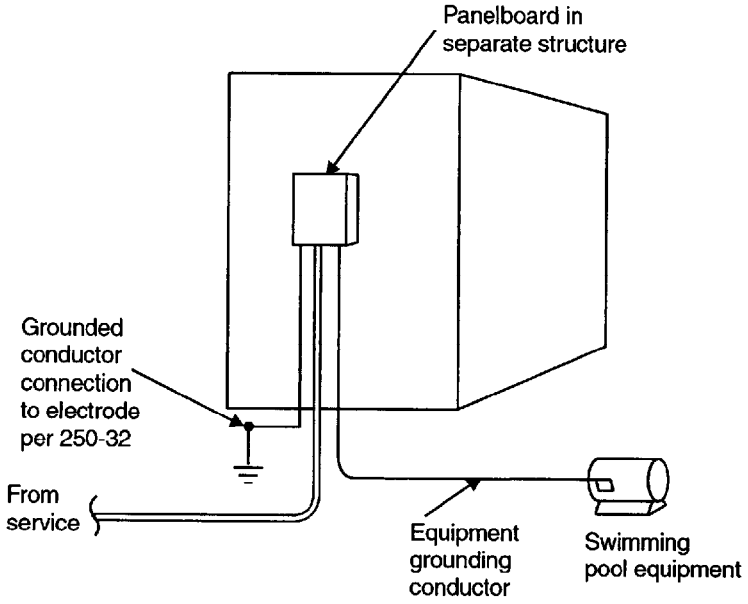
(2) A panelboard at a separate building shall be permitted to supply swimming pool equipment if the feeder meets the requirements for grounding in Section 250-32. Where installed, an equipment grounding conductor shall be an insulated conductor. (ROC 20-130)

(ROP 20-157)

Application

The illustration depicts pool equipment fed from a panelboard at a separate building. A separate building is often supplied by a feeder and wiring method that does not include an equipment grounding conductor and does not provide a continuous metallic pathway back to the service. The grounded conductor is connected to a grounding electrode at the separate building in accordance with Section 250-32(b)(2). Equipment grounding conductors to the pool equipment need only extend to the panelboard in the separate building, and the panelboard in the separate building is not required to have an equipment grounding conductor extending back to the service.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:32 2005



Pool Wiring from Separate Buildings

Background and Explanation

The general rule in Section 680-25(d) requires an equipment grounding conductor to be installed between a panelboard serving swimming pool equipment and the service or the source of a separately derived system. This change allows pool equipment to be supplied from a panelboard in a separate building where no equipment grounding conductor is extended from the service (or derived system) to the panelboard. Grounding at the separate building must meet the requirements of Section 250-32.

680-38 Emergency Switch for Spas and Hot Tubs

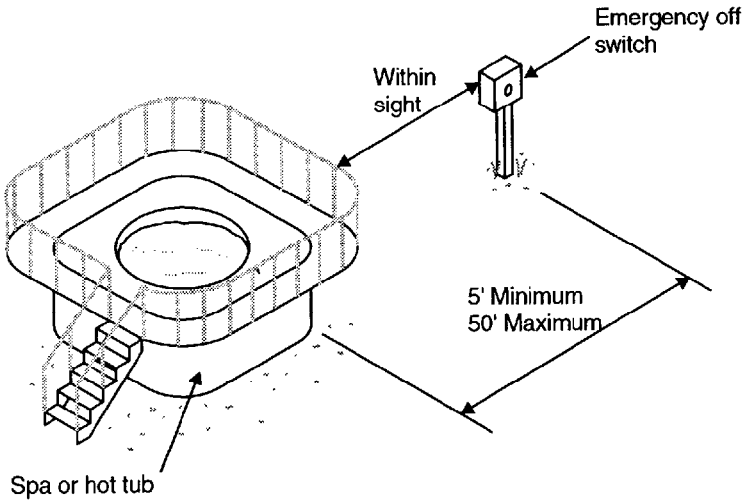
Type of Change New

BRIEF SUMMARY

Residential and commercial. An emergency shutoff switch is required for spas and hot tubs. The change does not apply to spas and hot tubs installed at a one-family dwelling.

Code Language

680-38. Emergency Switch for Spas and Hot Tubs. A clearly labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed readily accessible to the users and at least 5 ft (1.52 m) away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.



Emergency Control Required

Application

An emergency shutoff switch or control switch must be installed within sight of and at least 5 feet from the spa or hot tub. This shutoff switch must be clearly labeled as an emergency shutoff. This shutoff switch can be either a line-operated device or a

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:33 2005

remote-control circuit that causes the pump circuit to open. This requirement does not apply to one-family dwellings. The 50-foot distance shown in the illustration is based on the definition of "within sight" (in sight from) from Article 100.

Background and Explanation

Cases of injury and drowning have been reported where hair has been pulled into water intakes causing bathers to be trapped underwater. In many installations the disconnecting means is available but not clearly identified as an emergency shutoff switch.

Wed Feb 02 02:32:33 2005

680-57 Signs in Fountains

Type of Change New

BRIEF SUMMARY

Commercial. Requirements for signs located in fountains have been provided.

Code Language

680-57. Signs. (ROP 20-201)

(a) General. Includes only fixed, stationary electrically illuminated utilization equipment with words or symbols designed to convey information or attract attention.

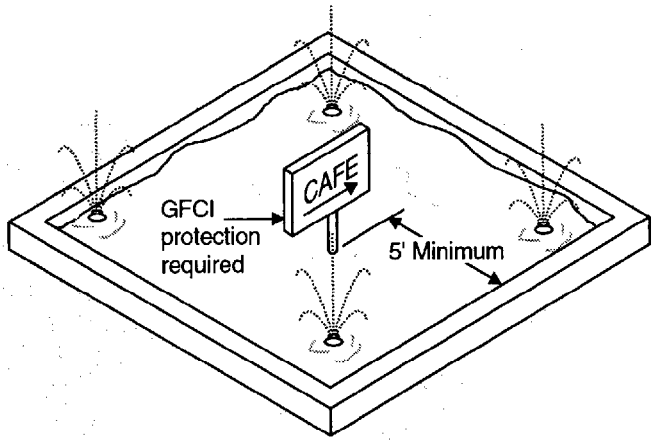
(b) Ground-Fault Circuit-Interrupter Protection for Personnel. All circuits supplying the sign shall have ground-fault circuit-interruter protection for personnel.

(c) Location. Any sign installed inside a fountain shall be at least 5 ft (1.52 m) inside the fountain measured from the outside edges of the fountain.

(d) Disconnect. Shall comply with Section 600-6.

(e) Bonding. Shall comply with Section 600-7.

(f) Grounding. Any equipment associated with the sign shall be grounded as per Article 250. (ROP 20-201)



Electric Signs in Fountains

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:34 2005

Application

Signs located in fountains are required to have GFCI protection for personnel. This protection may be provided in the feeder or branch circuit. To prevent contact by persons around the fountain, the sign must be at least 5 feet from the edge of the fountain. Disconnecting and bonding requirements in Article 600 apply, and grounding is to be provided in accordance with the applicable provisions of Article 250.

Background and Explanation

The use of signs within fountains is becoming an increasingly popular type of installation. Prior to the 1999 NEC, there were rules for signs in Article 600 and rules for fountains in Article 680, but there were no specific rules for signs installed in fountains. This new section provides requirements for this type of installation. In many cases, these signs may be in a location where the public has direct access to the sign and fountain.

680-62(a) GFCI Protection for Therapeutic Pools and Tubs

Type of Change Revision

BRIEF SUMMARY

Commercial. Protection requirements for large, self-contained tubs and pools were clarified. Some therapeutic equipment is exempt from GFCI requirements.

Code Language

680-62. Therapeutic Tubs (Hydrotherapeutic Tanks). Therapeutic tubs, used for the submersion and treatment of patients, that are not easily moved from one place to another in normal use or that are fastened or otherwise secured at a specific location, including associated piping systems, shall conform to this part.

(a) Protection. The outlet(s) that supplies the following shall be protected by a ground-fault circuit interrupter:

(1) A self-contained therapeutic tub or hydrotherapeutic tank, or

(2) A packaged therapeutic tub or hydrotherapeutic tank, or

(3) A field-assembled therapeutic tub or hydrotherapeutic tank with a heater load of 50 amperes or less

A listed self-contained unit or listed packaged equipment assembly marked to indicate that integral ground-fault circuit-interrupter protection is provided for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall not require that the outlet supply be protected by a ground-fault circuit interrupter.

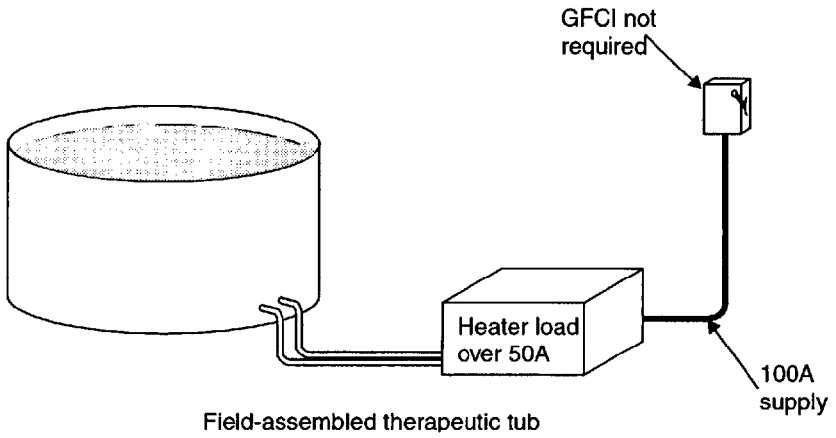
A field-assembled therapeutic tub or hydrotherapeutic tank rated greater than 250 volts or rated 3 phase shall not require the supply to be protected by a ground-fault circuit interrupter. (ROP 20-203)

Application

The illustration shows a large field-assembled therapeutic tub that is not required to have GFCI protection in its electrical supply because the heater load is over 50 amperes. The following table summarizes the rules for equipment required and not required to be GFCI protected.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:34 2005

GFCI-Protected Outlet Required	*GFCI-Protected Outlet Not Required*
1. Self-contained therapeutic tub or hydrotherapeutic tank without integral GFCI protection for all components	1. Listed self-contained unit or listed packaged equipment assembly with integral GFCI protection for all components
2. Packaged therapeutic tub or hydrotherapeutic tank without GFCI protection for all components	2. Field-assembled therapeutic tub or hydrotherapeutic tank rated over 250 volts or rated 3 phase or with a heater load over 50 amperes
3. Field-assembled therapeutic tub or hydrotherapeutic tank with heater load not over 50 amperes	



GFCI Requirements for Therapeutic Tubs and Tanks

Background and Explanation

This change was intended to clarify the rules for GFCI protection of large hydrotherapeutic tanks and large therapeutic tubs. The previous rule required GFCI protection for all therapeutic equipment, which made construction of large tubs and tanks virtually impossible because GFCI protective devices are not available in all voltage and amperage ratings.

Wed Feb 02 02:32:35 2005

680-72 Access Requirements for Hydromassage Tub Equipment

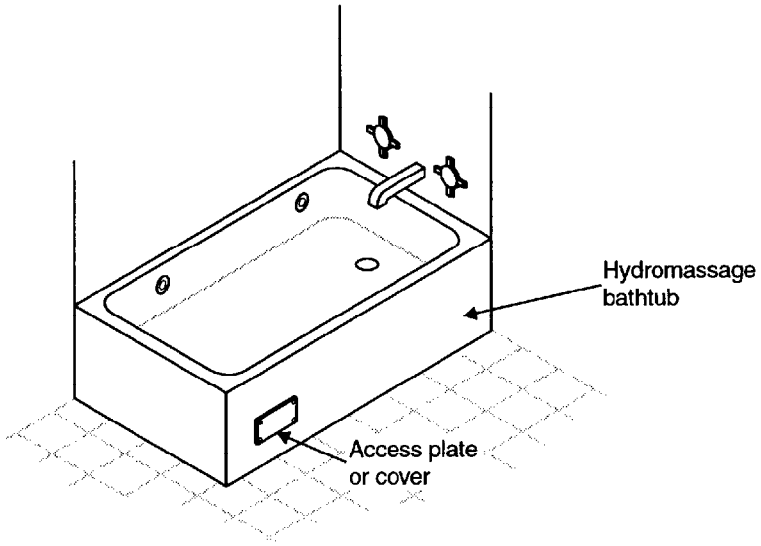
Type of Change New

BRIEF SUMMARY

Residential and commercial. Access for hydromassage bathtub equipment is required.

Code Language

680-72. Accessibility. Hydromassage bathtub electrical equipment shall be accessible without damaging the building structure or building finish. (ROP 20-209) (ROC 20-149)



Access for Associated Electrical Equipment

Application

Pump motors and other electrical components are often located below the tub unit and may require an access panel to allow maintenance. Where necessary, access panels must be provided to allow servicing of hydromassage bathtub systems without damaging the building structure or finish.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:35 2005

Background and Explanation

Building codes or plumbing codes may not require access to electrical equipment. This section is intended to ensure that the electrical equipment associated with hydromassage bathtubs can be accessed for maintenance or repair without damaging the finish or structure of a building. The access panel may either be an integral part of the tub unit or one that is provided in the finish that encloses the tub.

Wed Feb 02 02:32:36 2005

Application

The table illustrates the reorganization of Article 695. Important specific changes are covered separately.

Background and Explanation

The rewrite of Article 695 involves some important changes such as a provision to allow power sources that do not originate from a utility. These changes will be covered separately. The table illustrating the reorganization indicates the sections that were moved, those that were rewritten or retitled, and those that are new.

The reorganization and revisions to Article 695 represent the efforts on the part of the National Electrical Code Committee and the NFPA Technical Committe on Fire Pumps to harmonize the areas of common requirements in the NEC and NFPA-20-1996. Of particular concern to both committees was resolving the problem of providing reliable power for electric fire pumps installed throughout multibuilding campus-style complexes.

NEC pp. 497–498

695-3 Alternatives for Providing Reliable Power Source

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Power production sources other than generators are recognized as reliable power sources for fire pumps. Dual feeders to separate buildings on multibuilding, campus-style complexes are also recognized.

Code Language

695-3. Power Source(s) for Electric Motor-Driven Fire Pumps. **Electric motor-driven fire pumps shall have a reliable source of power.** (ROC 15-77) (TCC 15-77)

[x](a) Individual Sources. Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor-driven fire pump shall be one or more of the following. (ROC 15-80)

(ROC 15-75)

(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or by a tap located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with Section 230-82(4). The service equipment shall comply with the labeling requirements in Section 230-2 and the location requirements in Section 230-72(b).

(2) On-Site Power Production Facility. A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire.

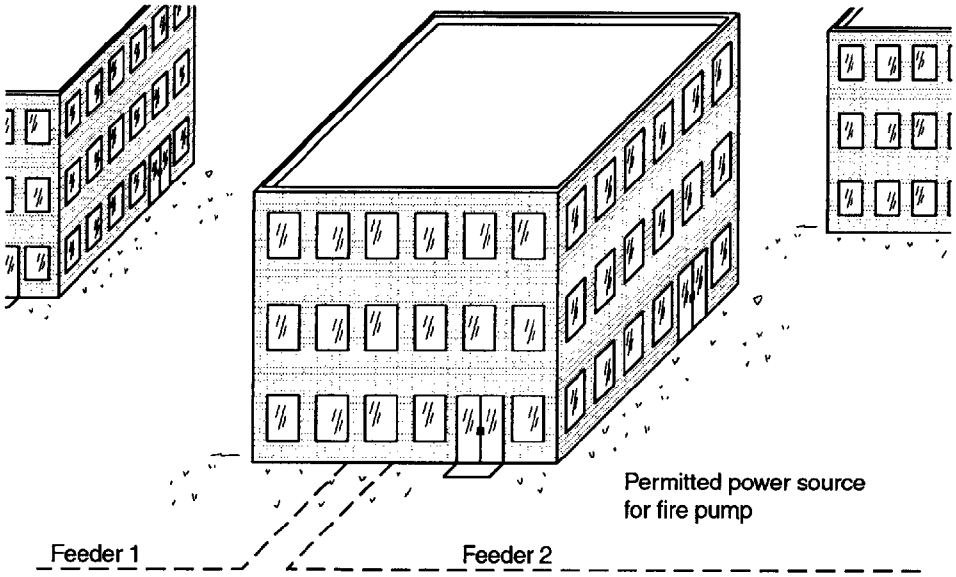
[x](b) Multiple Sources. Where reliable power cannot be obtained from a source described in Section 695-3(a), power shall be supplied from an **approved combination of** two or more of either of such sources **or from an approved combination of one or more of such sources in combination with an on-site standby generator complying with (1) and (3) or two or more feeders complying with (2) or (3) or from two or more sets of feeders complying with (2) and (3).** (ROC 15-80, 15-77)

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:36 2005

(1) Generator Capacity. An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator shall not be required. (ROC 15-85, 15-86) (TCC 15-77)

(2) Feeder Sources. This section applies to multi-building campus-style complexes with fire pumps at one or more buildings. Where sources in Section 695-3(a) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of Section 695-4(b). (ROC 15-77, 15-82, 15-83) (TCC 15-77)

(3) Arrangement. The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. (ROC 15-77)



Feeders Serving Fire Pumps

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:37 2005

Application

Power sources for electric fire pumps must be reliable and have adequate capacity to carry the locked-rotor currents of fire pump motors plus the full load currents of accessory equipment. One or more of three basic types of sources are permitted. Power may be supplied by a separate utility service, by on-site power production, or with the approval of the authority having jurisdiction, by two or more feeders on multibuilding campuses where direct utility connection or power produced on site are not reasonably available. If none of these options is individually capable of providing reliable power with adequate capacity, multiple sources may be used.

The illustration depicts a building in a campus-style complex. Utility power is not available in this case. Two feeders are used to provide the reliability required. Each feeder and its power source and overcurrent devices must be capable of allowing locked-rotor current to continue indefinitely.

The portions of Section 695-3 marked with a superscript "x" are extracted from NFPA 20-1996, *Standard for the Installation of Centifugal Fire Pumps.*

Background and Explanation

One of the most significant changes in this section is in the permission to use power sources other than separate services or on-site generation facilities as the sole reliable power source to supply electrically driven fire pumps. Since "on-site power production facilities" are now permitted, sources other than rotating generators are permitted as long as they have adequate capacity. Another significant change addresses the power source for multibuilding complexes. Since many multibuilding complexes are supplied by a single utility service, providing separate services for fire pumps at individual buildings is not feasable. To address this type of installation the 1999 NEC permits two or more feeder sources to be treated as a single reliable power source or as multiple sources where the feeders are supplied by separate utility services. The absence of this last option in the 1996 code rendered Article 695 difficult to apply to a multi-building campus-type of facility.

695-6(a), (b), (c) & 700-9 Protection of Fire Pump and Emergency System Conductors

NEC pp. 499 & 502

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Requirements for fire protection of fire pump and emergency system wiring have been clarified.

Code Language

695-6. Power Wiring. **Power circuits and wiring methods shall comply with the requirements in (a) through (g), and as permitted in Section 230-90(a), Exception No. 4; Section 230-94, Exception No. 4; Section 230-95, Exception No. 2; Section 240-13(3); Section 230-208, Section 240-3(a), and Section 430-31.** (ROC 15-75)

(a) Service Conductors. Supply conductors shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside buildings, they shall be permitted to be routed through buildings where installed **in accordance with Condition No. 1 or Condition No. 2 of Section 230-6. Where a fire pump is wired under the provisions of Section 695-3(b)(2), this requirement shall apply to all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump.** (ROP 15-99) (TCC 15-75)

Exception: Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement shall only apply to those conductors on the load side of that point of automatic connection between sources.

(b) Circuit Conductors. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by Section 695-4(b) shall be kept entirely independent of all other wiring. They shall only supply loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) encased in 2 in. (50.8 mm) of concrete or within enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistance rating, or they shall be permitted to be within listed electrical circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used. (ROP 15-99)

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:38 2005

Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room ***shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by Section 700-9(d) of this Code.*** (ROP 15-99)

(c) Conductor Size.

(1) Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a minimum rating of 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment. (ROP 15-99)

(2) Conductors supplying only a fire pump motor(s) shall have a minimum rating of 125 percent of the fire pump motor(s) full-load current(s). (ROP 15-99) (ROC 15-75)

700-9. Wiring, Emergency System.

(d) Fire Protection. Emergency systems shall meet the following additional requirements in assembly occupancies greater than 1000 persons or in buildings above 75 ft (23 m) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile. (ROP 15-126a)

(1) Feeder-circuit wiring shall meet one of the following conditions:
(ROP 15-130a)

(a) Be installed within ~~spaces~~ buildings that are fully protected by an approved automatic fire suppression system

(b) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

(c) Be protected by a listed thermal barrier system for electrical system components

(d) Be protected by a fire-rated assembly having a minimum fire rating of 1 hour (ROC 15-117) (TCC 15-117)

(e) Be embedded in a minimum of 2 in. (50.8 mm) of concrete (ROP 15-130a)

(f) Be a cable listed to maintain circuit integrity for a minimum of 1 hour when installed in accordance with the listing requirements (ROC 15-114)

(2) Equipment for feeder circuits (including transfer switches, transformers, panelboards, etc.) shall be located either in spaces fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, etc.) or in spaces with a 1-hour fire resistance rating.

FPN: For the definition of *occupancy class*, see Section 4-1 of *Life Safety Code*, NFPA 101-1997.

(ROC 15-113)

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:38 2005

Protection Methods for Fire Pump Conductors, Emergency Feeders, and Emergency Distribution Equipment Where Routed or Located Inside Building

Method of Protection	*Fire Pump Conductors per Article 695*	*Emergency Feeders for Assembly Occupancies Greater Than 1000 People or Above 75 Feet in Height per Section 700-9(d)*	*Emergency Distribution Equipment for Assembly Occupancies Greater Than 1000 People or Above 75 Feet in Height per Section 700-9(d)*
1. Raceways embedded in 2" concrete	Permitted	Permitted	Not Applicable
2. Located in buildings fully protected by automatic fire suppression system	Not Permitted	Permitted	Permitted (Sprinkler protection in equipment space)
3. Listed electrical circuit protective system with minimum 1-hour fire rating	Not Permitted (Load side of service only)	Permitted	Not Applicable
4. Listed thermal barrier system for electrical system components	Not Permitted	Permitted	Not Applicable
5. Fire-rated assembly with minimum 1-hour fire rating	Permitted (Load side of service only)	Permitted	Permitted (Building space)
6. Cable listed to maintain circuit integrity for minimum of 1-hour	Not Permitted	Permitted	Not Applicable

Application

Section 695-6(a) covers fire pump service conductors. These conductors must be installed outside the building, or beneath the building under 2 inches of concrete, or inside the building encased in at least 2 inches of concrete or brick. Section 695-6(b) requires other fire pump supply conductors on the load side of any permitted disconnecting means and overcurrent device that are inside the building to be encased in at least 2 inches of concrete or protected by a listed electrical circuit protective system with at least a 1-hour fire resistance rating. Fire pump supply conductors within enclosed spaces that have a 1-hour fire resistance rating and are dedicated to the pump circuits are also recognized.

For some emergency systems, fire protection for supply conductors is also required. The requirements in Section 700-9(d) only apply in places of assembly for over 1000 persons or in buildings over 75 feet in height for any of the following occupancies:

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:38 2005

1. Assembly
2. Educational
3. Residential
4. Detention and correctional
5. Business
6. Mercantile

As with fire pumps, protection may be by encasement in 2 inches of concrete or listed electrical protective systems. Other recognized methods include fire suppression systems, thermal barriers, and 1-hour fire rated assemblies.

The table illustrates the acceptable protection methods for conductors and equipment associated with fire pumps and emergency systems.

Background and Explanation

These requirements ensure reliable operation of these critical life safety systems. The routing of the conductors within a building exposes them to physical damage and possibly direct damage from a fire. The protection provisions of these two sections address those physical damage concerns. Both articles were revised to eliminate exceptions and clarify the requirements.

695-10 Listed Fire Pump Equipment

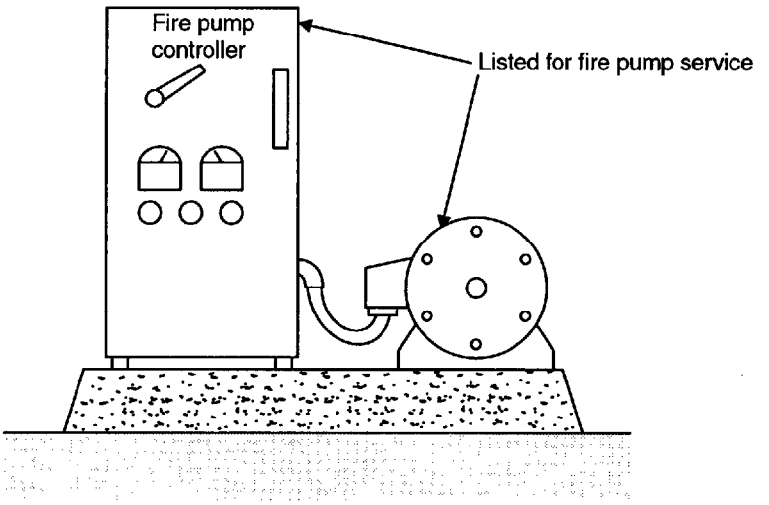
Type of Change New

BRIEF SUMMARY

Commercial and industrial. Listing for fire pump equipment is required.

Code Language

695-10. Listed Equipment. Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. (ROC 15-76) (TCC 15-76)



Equipment Listed for Fire Pump Service

Application

Controllers, transfer switches, and electric fire pump motors are required to be listed for fire pump service. This has been a requirement of NFPA 20 and has now been included in Article 695.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:39 2005

Background and Explanation

Listing of components is required by NFPA 20 *Standard for the Installation of Centrifugal Fire Pumps.* An effort has been made in the last two code cycles to make the requirements of NFPA 20 and Article 695 of the NEC similar. The inclusion of the listing requirement in Article 695 reflects that harmonization effort. Quite often the inspection of the electrical components is performed by an electrical inspector using only the NEC as the basis for approval.

NEC pp. 502 & 506

700-6(c) & 701-7 Mechanically Held Transfer Switches

Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. Automatic transfer switches for emergency or legally required standby systems are required to be mechanically held. Transfer equipment for emergency systems may not supply nonemergency loads.

Code Language

700-6. Transfer Equipment.

•
•
•

(c) Automatic transfer switches shall be electrically operated and mechanically held. (ROP 15-123a)

(d) Transfer equipment shall supply only emergency loads. (ROP 15-127)

701-7. Transfer Equipment.

•
•
•

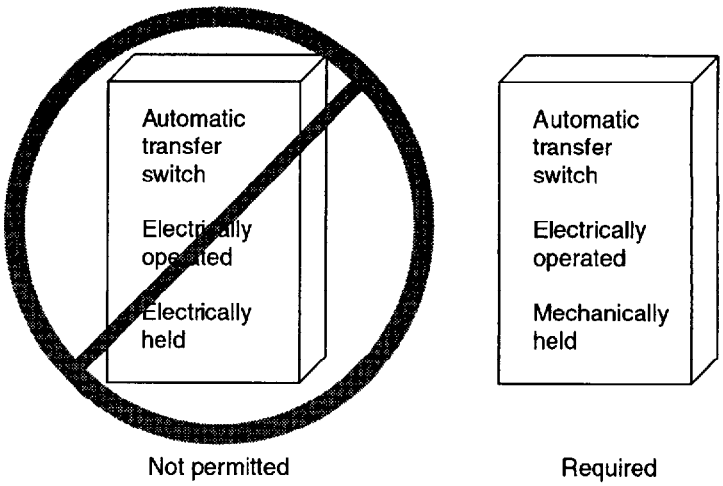
(c) **Automatic transfer switches shall be electrically operated and mechanically held.** (ROP 15-151b)

Application

As shown in the illustration, automatic transfer switches for emergency systems or legally required standby systems are required to be electrically operated and mechanically held. Electrically held switches are no longer permitted.

Transfer switches used for emergency systems cannot supply nonemergency loads other than as permitted by Sections 517-30(b)(4) for hospitals and 517-41(b) for nursing homes and limited care facilities. Transfer switches for legally required standby systems may supply other loads.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:40 2005



Tranfer Equipment Requirements

Background and Explanation

The new requirement for mechanically held switches was adopted because of a reported failure of an electrically held switch.

The restriction on the use of transfer switches for only emergency loads was based on the need to maximize the reliability of emergency systems. A failure of nonemergency equipment supplied by emergency transfer equipment might compromise the reliability of the emergency system.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:40 2005

725-24 Exc. No. 3 Overcurrent Protection for Electronic Class 1 Power Supplies

Type of Change New

BRIEF SUMMARY

All installations. Output conductors of a listed Class 1 electronic power supply may be protected by the input overcurrent device.

Code Language

725-24. Class 1 Circuit Overcurrent Device Location. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.

•
•
•

Exception No. 3: Electronic power source output conductors. Class 1 circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single-voltage) output for connection to Class 1 circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the Class 1 circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2 wire (single voltage), connected to Class 1 circuits shall not be considered to be protected by overcurrent protection on the input of the electronic power source. (ROP 16-19, 16-20)

FPN: A single-phase, listed electronic power supply whose output supplies a 2-wire (single-voltage) circuit is an example of a Class 1 power source meeting the requirements of Section 725-23. (ROP 16-20)

Application

The illustration depicts a listed Class 1 electronic power supply with output conductors that are not protected where they receive their supply as required by the main rule of Section 725-24. A new exception allows the conductors on the output side of a listed Class 1 power supply to be protected by the input overcurrent device. The maximum size input overcurrent device that will protect the output conductors is determined as follows:

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:40 2005

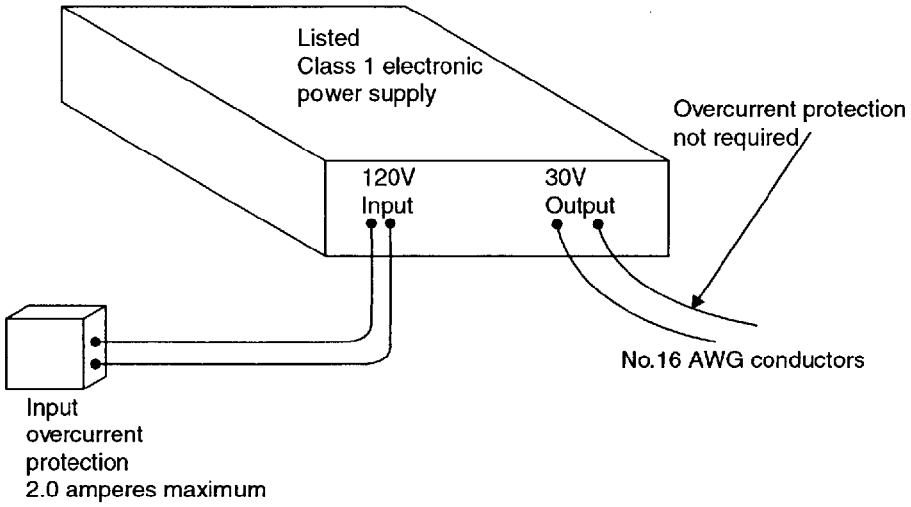
The ampacity of a No. 16 conductor is found in Sections 725-27(a) and 402-5 (8 amperes).

Max. Input OCD = output ampacity × output voltage/input voltage

Max. Input OCD = 8 amperes × 30 volts/120 volts = 8 amperes × 0.25

Max. Input OCD = 2.0 amperes

Therefore, the No. 16 Class 1 conductors can be protected by a 2.0 ampere or smaller rated input overcurrent device.



Class 1 Circuit Protection

Background and Explanation

A number of editorial changes were made in this section. Exceptions Nos. 2 and 3 to Section 725-23 in the 1996 code were moved to Section 725-24 because they addressed the location of overcurrent protection rather than the value of overcurrent protection.

The previous Exception No. 1 under Section 725-24 remains. The previous Exception No. 2 under Section 725-24 was deleted and replaced with the previous Exception No. 2 from Section 725-23. The new exception for Class 1 electronic power supplies became Exception No. 3 to Section 725-24. The previous Exception No. 3 under Section 725-23 became Section 725-24 Exception No. 4.

The exceptions to Section 725-24 are all similar to the tap rules of Section 240-21, that is, they all address protection of Class 1 conductors that are not protected where they receive their supply. Exceptions Nos. 2 and 3 both apply only to power supplies and transformers with 2-wire outputs or secondaries. Also, Section 725-24 Exception No. 3 applies only to listed power supplies.

In general, Class 1 power supplies are not required to be listed, and Class 1 circuits can be supplied in a number of ways in accordance with Section 725-21. Class 2 and Class 3 power supplies, except for those supplied by a dry cell battery or a thermocouple, are required to be listed.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:41 2005

725-54(a)(1) Exc. No. 6 Separation Requirements for Class 2 and 3 Circuits in Cable Tray

Type of Change New

BRIEF SUMMARY

Commercial and industrial. Limited permission to install signaling conductors and other circuits in the same cable tray is provided.

Code Language

725-54. Installation of Conductors and Equipment.

(a) Separation from Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm Circuit Conductors, and Medium Power Network-Powered Broadband Communications Cables.

(1) In Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways. Cables and conductors of Class 2 and Class 3 circuits shall not be placed in any cable, cable tray, compartment, enclosure, manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm circuits, and medium power network-powered broadband communications cables. (ROP 16-34)

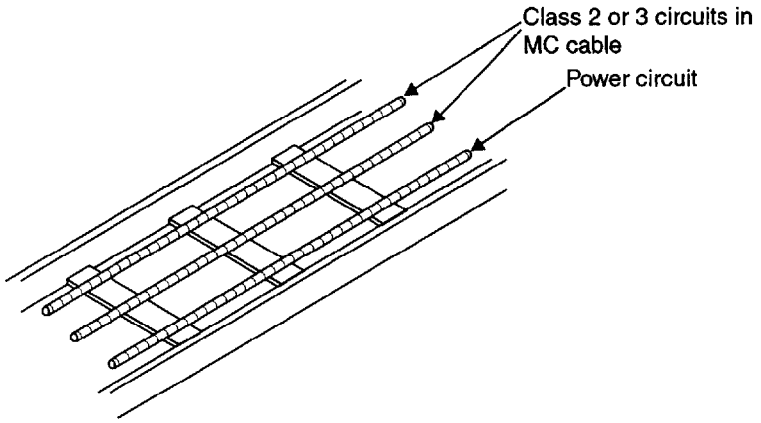
•
•
•

Exception No. 6: In cable trays, where the conductors of the electric light, power, Class 1, and nonpower-limited fire alarm circuits are separated by a solid fixed barrier of a material compatible with the cable tray, or where the Class 2 and Class 3 circuits are installed in Type MC cable. (ROP 16-37)

Application

When a fixed barrier is installed, Class 2 or Class 3 control circuits may be installed in the same cable tray. Where Type MC cable is used as the wiring method for the Class 2 and Class 3 circuits, the barrier is not required in the cable tray. This new exception allows a common cable tray to be used for power and signaling circuits.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:41 2005



Power and Control Circuits in Common Cable Tray

Background and Explanation

A fixed barrier is the equivalent of providing two separate cable trays. There is no reason to prohibit the installation of Class 2 or Class 3 circuits in one section and power circuits in a separate section.

The cable armor of Type MC cable is also recognized as adequate separation between the Class 2 and Class 3 conductors and the conductors of power, Class 1, and nonpower-limited circuits.

725-61,760-61, 800-53 & 820-53 Cable Substitution Table Revisions

NEC pp. 516, 525, 540 & 549

Type of Change Revisions

BRIEF SUMMARY

All installations. The cable substitution tables were revised and clarified for remote control and signaling, fire alarms, communications, and CATV. Numerous permitted substitutions were eliminated, including the permission to substitute fire alarm cables for CL2 and CL3 cables.

Code Language

(ROP 16-45a)

Table 725-61. Cable Uses and Permitted Substitutions

Cable Type	*Use*	*References*	*Permitted Substitutions*
CL3P	Class 3 plenum cable	725-61(a)	CMP
CL2P	Class 2 plenum cable	725-61(a)	CMP, CL3P
CL3R	Class 3 riser cable	725-61(b)	CMP, CL3P, CMR
CL2R	Class 2 riser cable	725-61(b)	CMP, CL3P, CL2P, CMR, CL3R
PLTC	Power-limited tray cable	725-61(c) and (d)	
CL3	Class 3 cable	725-61(b), (e), and (f)	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC
CL2	Class 2 cable	725-61(b), (e), and (f)	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC,
CL3			
CL3X	Class 3 cable, limited use	725-61(b) and (e)	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC, CL3, CMX
CL2X	Class 2 cable, limited use	725-61(b) and (e)	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC,

Application

The permitted substitutions for Class 2 and Class 3 cables are given in the revised Table 725-61. For example, cable types MPP, MPR, MPG, MP, FPLP, FPLR, and FPL are no longer permitted as substitutions for Type CL2 cable. Similar changes were made in Article 760 for power-limited fire alarm cables, in Article 800 for communications cables, and in Article 820 for community antenna television (CATV) cables.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:42 2005

Background and Explanation

This change was originated by CMP 16, the code-making panel responsible for Articles 725, 760, 800, and 820. The panel substantiation was as follows: "The extensive revisions to the cable substitution tables and associated text have been made to clarify the more realistic usage of field applications for the various cable types. These changes make these tables more user-friendly and more clearly express their application."

Article 727 Use of Instrumentation Tray Cable

Type of Change Revision

BRIEF SUMMARY

Industrial. Extensive revisions were made to correlate articles and clarify cable usage.

Code Language

This article has been extensively revised. Refer to outline. (ROP 16-61)

Article 727 — Instrumentation Tray Cable: Type ITC

727-1. Scope
727-2. Definition.
727-3. Other Articles.
727-4. Uses Permitted.
727-5. Uses Not Permitted
727-6. Construction.
727-7. Marking.
727-8. Allowable Ampacity.
727-9. Overcurrent Protection.
727-10. Bends.

Background and Explanation

This article was new in the 1996 NEC. The revision was done by a Panel 16 task group with the goal of improved usability. Efforts were made to improve correlation with other articles. The scope statement of the article was revised to clearly identify the types of circuits (instrumentation and control) that Type ITC cable can be used for and the maximum voltage and current levels (150 volts and 5 amperes) of these circuits. A new rule for overcurrent protection of the conductors in type ITC cable has also been added.

NEC pp. 519 & 523

760-2 & 760-31(f) Circuit Integrity Cables for Fire Alarm Systems

Type of Change New

BRIEF SUMMARY

Fire alarm systems. The use of a new cable type has been recognized.

Code Language

760-2. Definitions. For purposes of this article, the following definitions apply.

Fire Alarm Circuit Integrity (CI) Cable. Cable used in fire alarm systems to ensure continued operation of critical circuits during a specified time under fire conditions. (ROP 16-74)

760-31. Listing and Marking of NPLFA Cables.

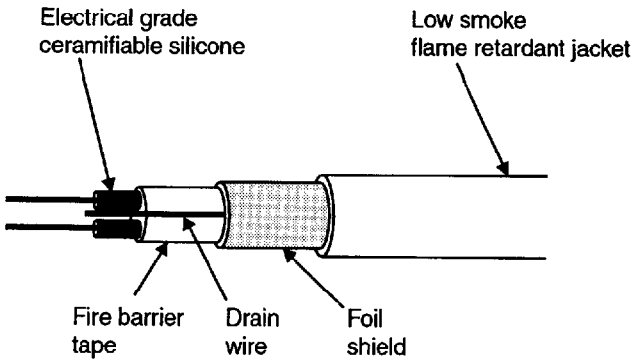
•
•
•

(f) Fire Alarm Circuit Integrity (CI) Cable. Cables suitable for use in fire alarm systems to ensure survivability of critical circuits during a specified time under fire conditions shall be listed as circuit integrity (CI) cable. Cables identified in Sections 760-31(c), (d), and (e) meeting the requirements for circuit integrity shall have the additional classification using the suffix "CI" (for example, NPLFP-CI, NPLFR-CI and NPLF-CI). (ROP 16-95)

FPN No. 1: This cable may be used for fire alarm circuits to comply with the survivability requirements of *National Fire Alarm Code*,® NFPA 72-1996, subsections 3-2.4, 3-4.4, 3-12.4, and 3-12.4.3, that the cable maintain its electrical function during fire conditions for a defined period of time.

FPN No. 2: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with the *Standard for Tests of Fire Resistive Cables,* UL 2196 - 1995. (ROP 16-95)

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:43 2005



Circuit Integrity Cable

Application

There are provisions in the *National Fire Alarm Code*, NFPA 72-1996, that require continued operation of the fire alarm system including circuit wiring, under severe conditions such as attack by fire. To provide this integrity, NFPA 72 recognizes the use of 2-hour fire-rated cable assemblies. FPN No.2 refers to cables tested in accordance with UL 2196 as an example of the type of wiring method that would qualify as circuit integrity (CI) cable.

Background and Explanation

New cable types are available for use where survivability of critical fire alarm circuits is required. This new cable is identified with the cable marking suffix CI. An example of this marking would be NPLFP-CI for nonpower-limited fire alarm plenum-rated cable that not only meets the performance requirements for a cable installed in a plenum but that also has been evaluated for its ability to maintain circuit integrity for a specified time period. Although these requirements are relatively new to the NEC and NFAC, survivability requirements for critical systems has been a requirement of the U.S. Nuclear Regulatory Commission (NRC) for the construction of nuclear power plants.

760-7 Fire Alarm Circuits Installed Outdoors

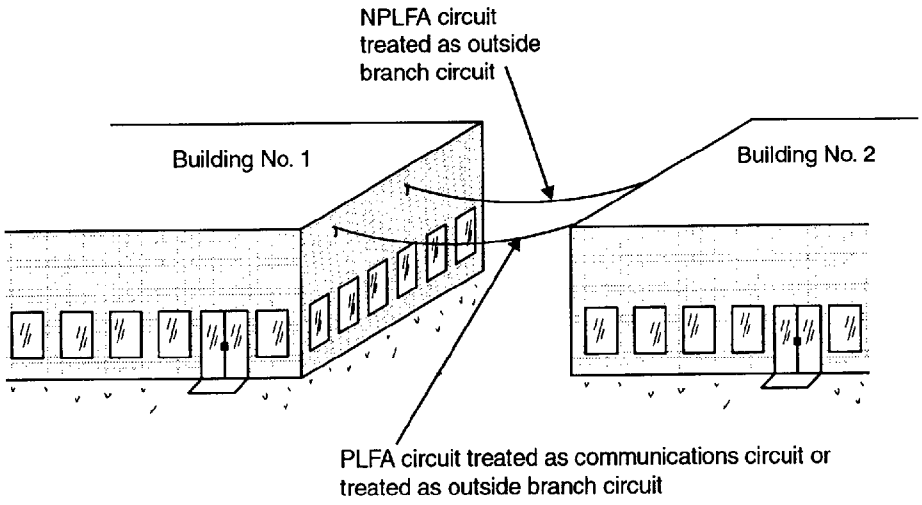
Type of Change Revision

BRIEF SUMMARY

Commercial and industrial. The installation requirements and classification of fire alarm circuits run outside has been clarified.

Code Language

760-7. Fire Alarm Circuits Extending Beyond One Building. **Power-limited** fire alarm circuits that extend beyond one building **and run outdoors** shall either meet the **installation** requirements of **Parts B, C, and D** of Article 800, ~~and be classified as communication circuits~~ or shall meet the **installation** requirements of Article 225. **Nonpower-limited fire alarm circuits that extend beyond one building and run outdoors shall meet the requirements of Article 225.** (ROP 16-78)



Outside Fire Alarm Circuits

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:43 2005

Application

The illustration shows two fire alarm circuits run outside between two buildings. The nonpower-limited fire alarm (NPLFA) circuit must be treated as an outside branch circuit and must be installed in accordance with Article 225. The power-limited fire alarm (PLFA) circuit may be installed either as an outside branch circuit in accordance with Article 225 or as a communications circuit in accordance with Parts B, C, and D of Article 800. If the fire alarm circuits are alternating current and the circuits are run outside and overhead as shown in the illustration, the circuits must also be grounded in accordance with Sections 250-20(a)(3) and 250-112(i).

Background and Explanation

This change was made primarily to clarify that fire alarm circuits that extend beyond a building and run outdoors are still classified as fire alarm circuits but must meet the applicable installation requirements of communications circuits or outside branch circuits. Fire alarm circuits treated as communications circuits must comply with clearance, spacing, attachment, grounding, and protection requirements of Article 800 for communications circuits, but can use communications-grade wiring methods. Fire alarm circuits treated as outside branch circuits must meet the clearance, spacing, attachment, and protection requirements of Article 225 and must use wiring methods suitable for outside branch circuits.

Wed Feb 02 02:32:44 2005

760-52(a) Exc. No. 3 FPN Reclassification of Fire Alarm Circuits

NEC p. 524

Type of Change New

BRIEF SUMMARY

All installations. A FPN clarifies the reclassification of power-limited fire alarm circuits.

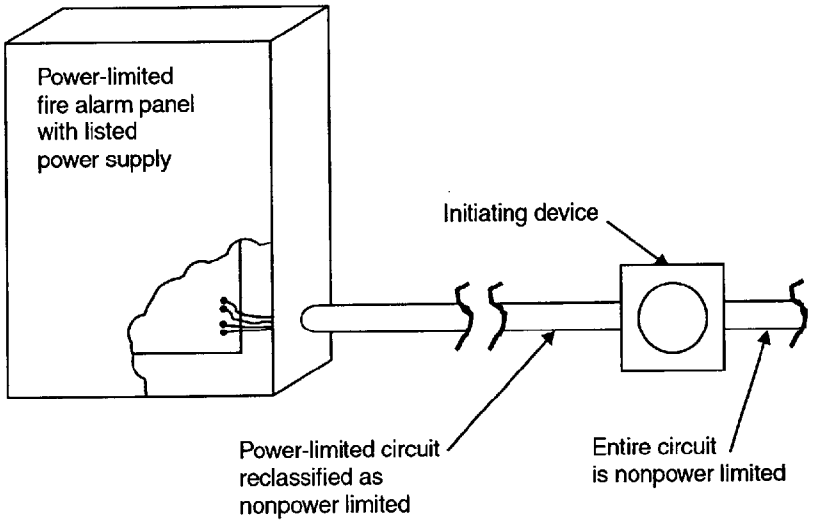
Code Language

760-52(a). NPLFA Wiring Methods and Materials.

•
•
•

Exception No. 3: Power-limited circuits shall be permitted to be reclassified and installed as nonpower-limited circuits if the power-limited fire alarm circuit markings required by Section 760-42 are eliminated and the entire circuit is installed using the wiring methods and materials in accordance with Part B, Nonpower-Limited Fire Alarm Circuits.

FPN: Power-limited circuits reclassified and installed as nonpower-limited circuits are no longer power-limited circuits, regardless of the continued connection to a power-limited source. (ROP 16-103)



Reclassification of Fire Alarm Circuits

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:44 2005

Application

The illustration depicts a fire alarm circuit connected to a power-limited source. The circuit has been reclassified as nonpower-limited so that nonpower-limited wiring methods may be used and power-limited markings are not required. Reclassification would also allow mixing of the fire alarm circuits with some other systems as permitted by Section 760-26. The entire circuit becomes a nonpower-limited circuit even though it continues to be connected to a power-limited source. The entire circuit must also use nonpower-limited wiring methods as specified in Sections 760-25 and 760-27.

Background and Explanation

The new FPN is intended to clarify the fact that once a fire alarm circuit has been reclassified as nonpower-limited, the entire circuit is nonpower-limited and must be treated as such, regardless of whether or not it is supplied by a power-limited source.

The rule allowing reclassification of fire alarm circuits is quite different from the rules for Class 2 and Class 3 remote control and signaling circuits. Class 2 and Class 3 circuits are classified by their connection to power-limited sources and are not permitted to be reclassified as nonpower-limited Class 1 circuits, unless required by Section 725-8 for safety control equipment. As noted above, a power-limited fire alarm circuit may be classified as nonpower-limited even though it remains connected to a power-limited source. Unlike Class 1 power-limited, Class 2, and Class 3 circuits, fire alarm circuits may be reclassified to permit alternative wiring methods.

NEC p. 524

760-52(b) Fire Alarm Device Installation

Type of Change Revision

BRIEF SUMMARY

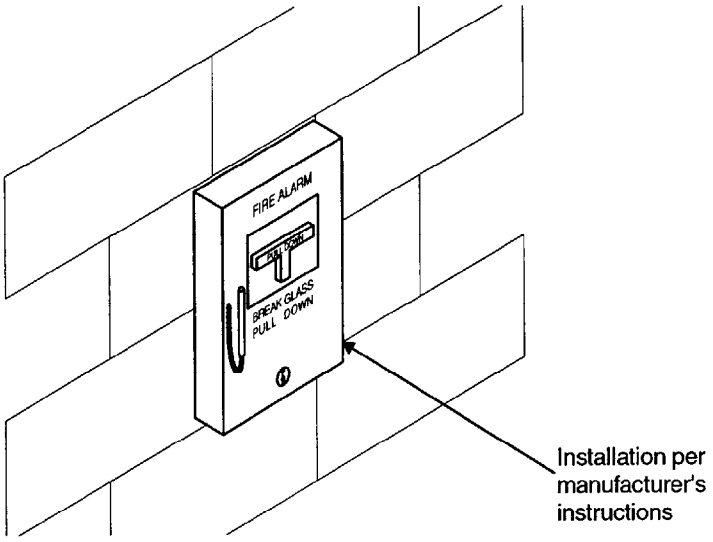
Fire alarm systems. The requirements for the proper installation of devices has been clarified.

Code Language

760-52. Wiring Methods and Materials on Load Side of the PLFA Power Source.

•
•
•

(b) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in Section 760-71 shall be installed as detailed in (1), (2), or (3) of this section. **Devices shall be installed in accordance with Sections 110-3(b), 300-11(a), and 300-15.** (ROP 16-98)



Installation Requirements for Fire Alarm System Devices

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:45 2005

Application

Three references have been added to this section to ensure that installers are aware of the need for compliance with instruction included in the listing and labeling. Section 110-3(b) requires listed devices to be installed in accordance with the listing and labeling instructions. Section 300-11(a) is a general requirement for proper support and securing of boxes and other equipment. This section also covers the use of ceiling support wires to secure electrical equipment above suspended ceilings. Section 300-15 requires boxes or other enclosures at all conductor splice points and the reference here applies to fire alarm devices.

Background and Explanation

Fire alarm installers may not be aware of the three sections referenced in this revised section. They typically focus on the requirements of Article 760 and the National Fire Alarm Code. This revision is intended to call attention to these sections, which require compliance with listing requirements, support of devices, and the use of boxes for the support of fire alarm devices where indicated in the device manufacturer's installation instructions.

770-6 Exc. Conduit Fill Requirements for Optical Fiber Raceways

Type of Change New

BRIEF SUMMARY

Optical fiber systems. The exception clarifies where conduit fill rules apply.

Code Language

770-6. Raceways for Optical Fiber Cables. The raceway shall be of a type permitted in Chapter 3 and installed in accordance with Chapter 3. (ROC 16-62)

Exception: Listed nonmetallic optical fiber raceway identified as general purpose, riser, or plenum optical fiber raceway in accordance with Section 770-51 and installed in accordance with Sections 331-7 through 331-14, where the requirements applicable to electrical nonmetallic tubing shall apply. Unlisted underground or outside plant construction plastic innerduct shall be terminated at the point of entrance. (ROC 16-63, 16-64)

FPN: For information on listing requirements for optical fiber raceways, see UL 2024, *Standard for Optical Fiber Raceways.* (ROP 16-127) (ROP 16-125, 16-129)

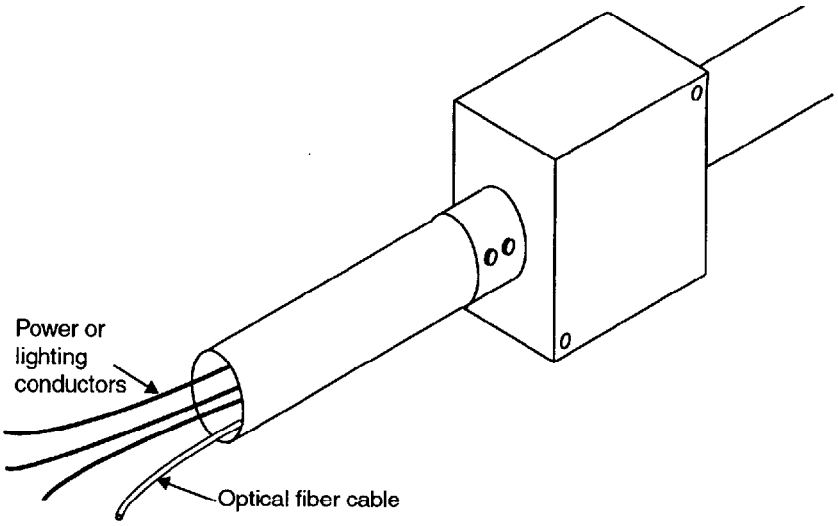
Where optical fiber cables are installed within the raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply.

Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply. (ROP 16-127, 16-128)

Application

Where only fiber optic cables are installed in a raceway, the raceway fill rules from Chapter 3 and Chapter 9 do not apply to the installation.Where a combination of optical fiber cables and electrical conductors are in the same raceway as permitted by Section 770-52, the Chapter 3 and Chapter 9 conduit fill limitations must be followed.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:45 2005



Common Raceway for Power and Fiber Optic Systems

Background and Explanation

Section 90-1 makes clear that the purpose of the code is electrical safety. Where only optical fiber cables are installed, a damaged cable will not present a safety hazard. Where electrical conductors are mixed with optical fiber, a damaged electrical conductor can present a fire or shock hazard. Section 770-6 has been changed from "Cable Trays" to "Raceways for Optical Fiber Cables."

Wed Feb 02 02:32:46 2005

800-4 Installation and Use of Listed and Labeled Equipment

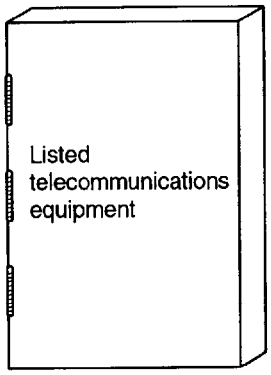
Type of Change Revision

BRIEF SUMMARY

All installations. Installation of telecommunications equipment must comply with instructions included in the listing and labeling.

Code Language

800-4. Equipment. Equipment intended to be electrically connected to a telecommunications network shall be listed for the purpose. **Installation of equipment shall also comply with Section 110-3(b).** (ROP 16-153)



110-3(b) Instructions included in listing and labeling must be followed.

Installation of Communications Equipment

Application

Electrically connected telecommunications equipment is required by Section 800-4 to be listed. The installation of such equipment must comply with the instructions included with the equipment or otherwise included in the listing and labeling instructions.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:46 2005

Background and Explanation

This change was made to clarify the application of listing and labeling requirements to communications equipment. According to Section 90-3, the articles of Chapter 8 are independent from the rest of the code, unless a specific reference is made within these articles to a requirement in Chapters 1 through 7. The requirements of Chapters 1 through 7 do not apply to Chapter 8 except where they are specifically referenced in Chapter 8. Although the previous rule required equipment to be listed, there was no specific requirement that the listing and labeling instructions be followed. The addition of a reference to Section 110-3(b) makes compliance with the instructions relating to communications equipment mandatory.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:46 2005

800-11(c) Point of Entry for Underground Communications

Type of Change New

BRIEF SUMMARY

All occupancies. A limited distance between communications point of entry and service entry is specified.

Code Language

800-11. Underground Circuits Entering Buildings. . . .

•
•
•

(c) Point of Entry. The point of entry for communications wiring and cables shall be within 20 ft (7.0 m) of the electrical service entry point.

Exception: Where it is impracticable to install the communications service in this manner, a separate grounding electrode, installed in compliance with Section 800-4(b)(3) and bonded in accordance with Section 800-40(c) and (d).

FPN: Under certain conditions, the length of the bonding conductor has a direct relationship to the difference in potential between the communications and the power circuits.

Application

A new rule requires a communications circuit entry to a building from underground to be within 20 feet of the electrical service entry point. Where this cannot reasonably be accomplished, a separate grounding electrode shall be installed in the vicinity of the communications point of entry and bonded to the service grounding electrode system.

Background and Explanation

The intent of this section is to limit the length of bonding conductors between communications and electrical service grounding points. As the FPN points out, the difference of potential between the systems may be directly related to the length of the bonding conductors. Although the Exception does not actually

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:47 2005

state a requirement, the intent of the Exception is to require an additional grounding electrode where the entry points cannot be within 20 feet of each other. Note that bonding to the electrical service is still required.

Similar requirements for overhead communications entries and all CATV entries were proposed for Sections 800-10(c) and 820-11(c). These proposals were accepted by the code panels but overturned by the NFPA membership. The new rule in Section 800-11(c) was rejected at the proposal stage and accepted after public comment, but was not changed by the NFPA membership.

In practice, underground communications entries can more easily be routed to various locations in a building than can overhead communications drops, because the point of entry for an underground raceway is where the raceway emerges from the underground. In the case of a grounded rigid metal conduit or intermediate metal conduit, the point of entry may be extended to the end of the conduit in accordance with the definition of "point of entrance" in Section 800-2. Similar descriptions of the point of entrance are found in Sections 800-30(b) and 800-33.

NEC p. 537

800-48 & 800-53 Installation and Use of Listed Communications Raceways

Type of Change New and Revised

BRIEF SUMMARY

All occupancies. These changes clarify the type of raceways allowed and recognize a new type of raceway for communications cables.

Code Language

800-48. Raceways for Communications Wires and Cables. Where communications wire and cables are installed in a raceway, the raceway shall be of a type permitted in Chapter 3 and installed in accordance with Chapter 3. (ROP 16-174) (ROC 16-97)

Exception: Listed nonmetallic communications raceway identified as general purpose, riser, or plenum in accordance with Section 800-51 and installed in accordance with Sections 331-7 through 331-14, where the requirements applicable to electrical nonmetallic tubing shall apply. (ROP 16-174) (ROC 16-63, 16-96)

800-53. Applications of Listed Communications Wires and Cables, and Communications Raceways. Communications wires and cables shall comply with (a) through (f).

(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. **Also, listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in Section 300-22(b) and in other spaces used for environmental air as described in Section 300-22(c). Only Type CMP cable shall be permitted to be installed in these raceways.** (ROP 16-197)

Exception: Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with Section 300-22.

(b) Riser. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. **Also, listed riser communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.** (ROP 16-197) (ROC 16-115a)

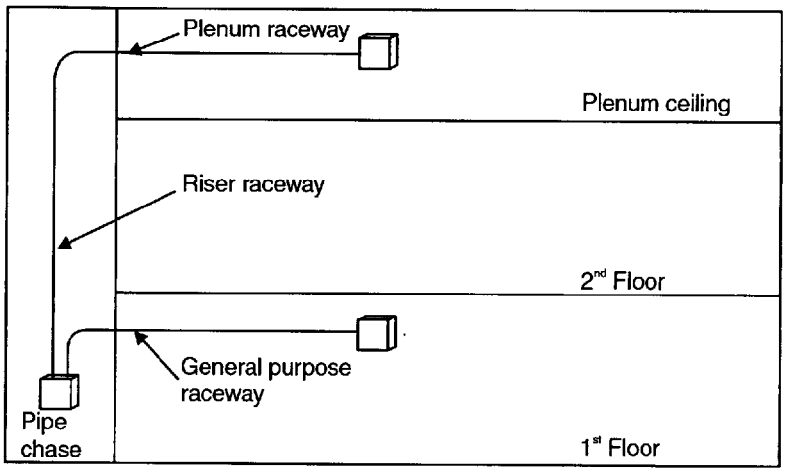
FPN: See Section 800-52(b) for firestop requirements for floor penetrations.

Exception No. 1: Where the listed cables are encased in metal raceway or are located in a fireproof shaft having firestops at each floor.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:47 2005

Exception No. 2: Types CM and CMX cable in one- and two-family dwellings.

(d) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in (a), (b), and (c) shall be Type CMG or Type CM. **Only Type CMG, CM, CMR, or CMP cables shall be permitted to be installed in general purpose communications raceways.** (ROP 16-197) (ROC 16-115a)



Use of communications raceways

Communication Raceways

Background and Explanation

Communication cables may be installed in any of the raceways recognized in Chapter 3 of the NEC. This change recognizes new types of communication raceways and also clarifies that raceways used for communications conductors and cables must be installed in accordance with the specific article covering that type of raceway and that only Chapter 3 raceways or listed communications raceways can be used for communication conductors and cables. The code also recognizes the use of listed nonmetallic communications raceways installed in accordance with specified provisions from Article 331, "Electrical Nonmetallic Tubing."

Section 800-53 has been revised to include three new types of listed communications raceways. Plenum communications raceways are required in ducts and plenums where smoke production and fire resistance are concerns. Riser communications raceways are used in vertical risers where vertical flame spread must be considered. General purpose communications raceways may be used in other locations.

Article 830 Network-Powered Broadband Communications Systems

Type of Change New

BRIEF SUMMARY

Residential and commercial. A new article has been added to cover network-powered broadband communications systems.

Code Language

830-1. Scope. This article covers network-powered broadband communications systems that provide any combination of voice, audio, video, data, and interactive services through a network interface unit.

FPN No. 1: A typical basic system configuration includes a cable supplying power and broadband signal to a network interface unit that converts the broadband signal to the component signals. Typical cables are coaxial cable with both broadband signal and power on the center conductor, composite metallic cable with a coaxial member for the broadband signal and a twisted pair for power, and composite optical fiber cable with a pair of conductors for power. Larger systems may also include network components such as amplifiers that require network power.

FPN No. 2: See Section 90-2(b)(4) for installations of broadband communications systems that are not covered.

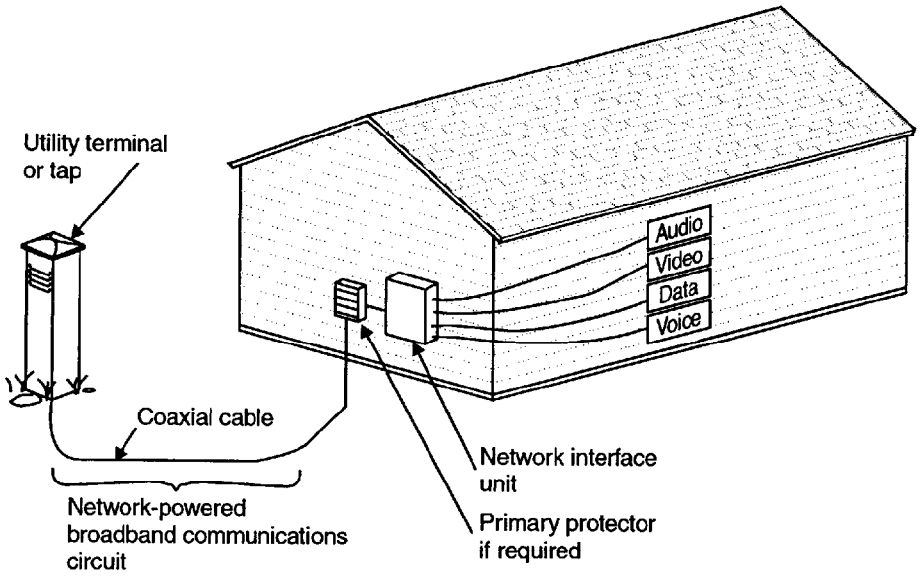
830-58	Installation of Network-Powered . . . Cables and Equipment



Network-Powered Broadband Communications System

Application

The illustration shows the typical components of a network-powered broadband communications system. Coaxial cable is shown in the diagram, but other cable types may be used. The cable carries a broadband signal for voice, audio, video, data, and interactive services. The same cable also supplies power from the network for conversion equipment. A primary protector may be required by Section 830-30. The network interface unit (NIU) separates the broadband signal into component signals as shown.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:49 2005

The outline above illustrates the organization of Article 830. Equipment and cables must be listed as suitable for the purpose. In most respects, the installation requirements for these systems are similar to other communications systems. However, Sections 830-10 and 830-11 contain specific provisions for overhead clearances, spacings from other conductors, mechanical protection, and burial depths that differ from the requirements of other articles in Chapter 8.

Background and Explanation

This change recognizes a type of communications system that is capable of delivering multiple services through a single network and a single line.

Cables may be coaxial, with the single central conductor carrying both power and the broadband signal. The cables may be a composite metallic cable, with a coaxial conductor for the broadband signal and a twisted pair for power, or the cables may be hybrid fiber optic with a pair of wires for power.

The power sources are required to be significantly limited. Network power sources are classified as low and medium. Low power networks are limited to 100 volts and 250VA. Medium power networks are limited to 150 volts and 250VA. A high power classification was proposed that was limited to 150 volts but had no power limitation. The high power classification was deleted from the new article after public comments.

This type of system provides its own power from the network rather than deriving its power from a normal premises wiring system. This fact is the basis of probably the most interesting and controversial aspect of this type of system: A separate, albeit very limited, power source is introduced without the requirements typical for a service. For example, this type of system requires no main disconnecting means. A main disconnect may not be desired on communications systems that may be relied on to summon emergency help. Grounding similar to the grounding required for communications or CATV systems is required in many cases, but some systems may operate ungrounded. A task group will continue to study these and other issues raised by public comments.

App. D Exs. D2(a) & (b) Revision to Optional Calculation Example

NEC pp. 609 & 610

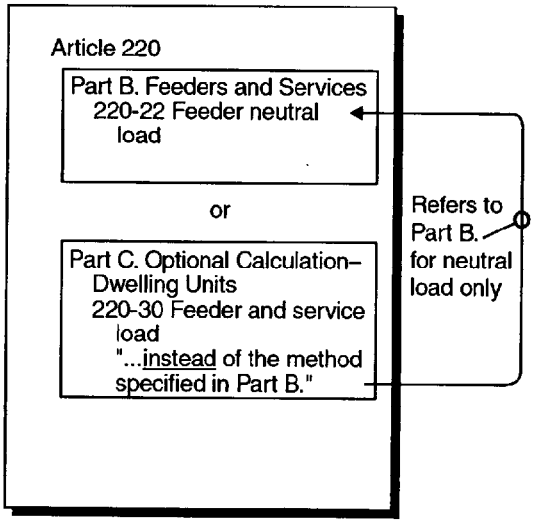
Type of Change Revision; Relocation

BRIEF SUMMARY

Residential. Optional calculation examples have been corrected.

Code Language

See illustration.



Optional Calculation Examples

Application

The examples are now located in Appendix D, which makes them advisory only. However, Examples D2(a) and D2(b) have been corrected to remove the references to Section 220-21, which is applicable only to calculations performed in accordance with Part B of Article 220.

Copyright by the National Fire Protection Association
Wed Feb 02 02:32:49 2005

Background and Explanation

As shown in the illustration, Article 220, Part C specifies an optional calculation method that may be used "instead of the method specified in Article 220, Part B." Section 220-30, which outlines the optional method, refers to Section 220-22 in Part B only for the calculation of feeder neutral loads.

In the 1996 code, Examples 2(a) and 2(b) eliminated the larger of the heating and air-conditioning loads by making a reference to Section 220-21. Examples D2(a) and D2(b) have been revised in the 1999 code by removing the references to Section 220-21. The air-conditioning load in D2(a) is still eliminated from the feeder load, but for a different reason. The air-conditioning is disregarded because it falls under Item 1 in Table 220-30 and it is smaller than Item 5. Item 5 in this case is 40 percent of the 9kVA heating load that consists of four or more separately controlled units. In D2(b), the heating load is disregarded because it falls under Item 4, and 65 percent of the space heater is less than 100 percent of the air-conditioning load (Item 1).

The final results in these two examples were not changed, but following the old examples with different heating and air-conditioning loads could result in improperly sized feeders. Section 220-15 of Part B requires that fixed electric space heating loads be calculated at 100 percent unless the authority having jurisdiction permits the use of a demand factor.

Other Fire Protection Resources from NFPA

National Fire Protection Association Membership

When you join NFPA, you join more than 66,000 fire protection professionals worldwide in the fight against loss of life and property from fire.

There are many membership benefits, including full voting rights in the code-making process at the Annual or Fall Meetings, free subscriptions to the NFPA *Journal®*, NFPA *Journal Buyers' Guide,* and the *NFPA News* and *NFPA Update* newsletters; a 10% discount on all NFPA products and services including videos, seminars, and meeting registration fees; and much more!

1999 Electronic NEC®

The electronic edition of the NEC represents the most convenient, versatile, and efficient way to reference the code. Anyone with a PC or Mac can tap into the new code instantly, use on-line help, search out any word or phrase...without missing a single reference. A powerful search engine tells you the most relevant places your topic is listed. Plus you can...

- print and export text;
- customize text with notes, highlights, and bookmarks; and
- put a host of other time-saving features to work!

Order today to take advantage of the latest technology!

1999 National Electrical Code® Handbook

The 1999 *NEC Handbook* is your best guide to the 1999 *National Electrical Code.* The handbook brings you the complete reorganized text of the new 1999 code, plus clear, authoritative commentary written by the electrical industry's leading experts. Over 500 photographs and illustrations—plus graphs, charts, and new color diagrams—enable you to visualize complex concepts and put them to work. Keep the 1999 *NEC Handbook* by your side and you'll have expert answers at hand!

To order or for more information on other NFPA products or seminars call toll-free at 1-800-344-3555 or visit our web site at www.nfpa.org.
