الف-۲ مراجع تجاری و صنعتی (NFPA, ASTM, ANSI, ASME و غیره)

۱. انجمن آمریکایی شاه راه‌ها و انتقال (AASHTO)

استاندارد طراحی شاه راه‌ها	AASHTO H20

۲. انجمن استاندارد بین‌المللی آمریکا (ANSI)

رویه شناسایی سیستم لوله کشی	ANSI A13.1
حداقل بارها برای طراحی ساختمانها و دیگر سازه‌ها	ANSI A58.1
فولاد کم کربن بدون درز و جوشکاری شده	ANSI B36.10M/B36.10

۳. انجمن نفت آمریکا (API)

خط لوله	API Spec 5L
خط لوله فایبرگلس فشار پایین	API Spec 15LR
فلنجهای کربن استیل با قطر بالا	API 605

٤. انجمن مهندسین عمران آمریکا (ASCE)

حداقل بارها برای طراحی ساختمانها و دیگر سازه‌ها	ASCE 7

٥. انجمن مهندسین مکانیک آمریکا (ASME) " ASME Boiler and Pressure Vessel Code Sections IV, V, VIII "

اتصالات پیچی رزوه‌ای	ASME B1.1
لوله های رزوه ای برای کاربرد عمومی	ASME B1.20.1
فلنجهای لوله و فلنجهای اتصالات از جنس چدن	ASME B16.1
فلنجهای لوله و فلنجهای اتصالات	ASME B16.5
استاندارد ساخت اتصالات Buttwelding فولادی کم کربن	ASME B16.9
اتصالات فورج، Socket-Welding و رزوه‌ای	ASME B16.11
واشر فلزی برای فلنجهای لوله	ASME B16.20
واشرهای غیر فلزی برای فلنجهای لوله	ASME B16.21
فلنجهای آلیاژهای مس و اتصالات فلنجی	ASME B16.24
Buttwelding Ends	ASME B16.25

ASME B16.28	Elbow و Return از جنس فولاد کم کربن چکش خوار
ASME B16.31	فلنجهای لوله غیر آهنی
ASME B16.42	فلنجهای لوله و اتصالات فلنجی آهنی چکش خوار
ASME B16.47	فلنجهای فولادی با قطر بالا
ASME B31.1	لوله کشی نیروگاه
ASME B31.1	لوله کشی واحدهای شیمیایی، پتروشیمیایی و پالایشگاهی

٦. انجمن تست و مواد آمریکا (ASTM)

ASTM A 47M/A 47	آهن چکش خوار
ASTM A 53	لوله فولادی، پوشش روی شده درزدار و بدون درز
ASTM A 105M/A 105	کربن استیل فورج
ASTM A 106	لوله کربن استیل بدون درز
ASTM A 126	چدن کبود برای شیرها، فلنجها و اتصالات لوله ای
ASTM A 135	حفاظت الکتریکی لوله فولای جوش کاری شده
ASTM A 182M/A 182	پایپ فلنجهای فورج و حلقوی، اتصالات فورج، شیر و غیره
ASTM A 193M/A 193	پیچهای از جنس فولاد ضدزنگ و آلیاژهای فولاد
ASTM A 194M/A 194	مهره ها برای آلیاژهای فولاد کربن دار در سرویسهای دما/فشار بالا
ASTM A 216M/A 216	فولاد چدنی برای سرویسهای دما بالا
ASTM A 217M/A 217	فولاد چدنی، فولاد ضد زنگ ماستنیکی و آلیاژهایش برای دماهای بالا
ASTM A 307	پیچ و میخهای کربن استیل با مقاوت کششی ۶۰/۰۰۰ psi
ASTM A 312M/A 312	لوله بدون درز و درزدار فولاد ضد زنگ استنیتی
ASTM A 333M/A 333	لوله بدون درز و درز دار فولادی برای دماهای پایین
ASTM A 351M/A 351	چدن، استنیتی و فریک-آستنیت
ASTM A 403M/A 403	اتصالات لوله‌ای فولاد ضد زنگ آستنیتی
ASTM A 494	چدن، نیکل و آلیاژهای نیکل
ASTM A 587	حفاظت الکتریکی برای جوشکاری لوله کربن استیل
ASTM A 691	لوله کربنی و آلیاژهای فولاد، EFW برای سرویسهای دما/فشار بالا
ASTM A 727M/a 727	کربن استیل فورج برای اجزاء لوله
ASTM A 731M/A 731	لوله فولاد ضد زنگ مارتنستیک بدون درز و درزدار با جوش آهنی

جوش یک یا دوطرفه برای لوله فولادی آستنیتی بدون درز	ASTM A 813M/A 813
جوشکاری لوله فولادی آستنیتی در شرایط سرد	ASTM A 814M/A 814
اتصالات لوله های بدون درز فولاد ضد زنگ مارتنسیک، آهن-دار/آستنیتی، آهن‌دار چکش‌خوار	ASTM A 815M/A 815
اتصالات کربن استیل برای شرایط عملکردی داغ	ASTM A 858M/A 858
لوله مسی بدون درز در اندازه‌های استاندارد	ASTM B 42
خطوط و شیرهای برنزی	ASTM B 61
کامپوزیتهای برنزی	ASTM B 62
شمش و میله‌های نیکل	ASTM B 160
لوله و تیوبهای بدون درز	ASTM B 161
لوله و تیوب‌های آلیاژهای نیکل-مس (N04400) بدون درز	ASTM B 165
لوله و تیوبهای آلومینیومی و آلیاژهای آلومینیومی بدون درز	ASTM B 241M/B 241
آلومینیوم و آلیاژهای آلومینیوم فورج قالبی، فورج دستی، فورج حلقوی	ASTM B 247M/B 247
لوله و تیوبهای آلومینیومی و آلیاژهای آلومینیومی بدون درز برای سیستمهای انتقال نفت و گاز و سیستم توزیع	ASTM B 345M/B 345
استاندارد ساخت اتصالات جوشی آلومینیومی و آلیاژهای آلومینیومی چکش خوار	ASTM B 361
استاندارد ساخت اتصالات جوشی نیکل و آلیاژهای نیکل چکش خوار	ASTM B 366
لوله درز دار کروم-نیکل-آهن(N06600) ، N06025, N06045	ASTM B 517
فورجینگهای آلیاژ نیکل	ASTM B 564
آلیاژهای مس برای کاربردهای عمومی	ASTM B 584
لوله‌های درز دار آلیاژ مس	ASTM B 608
لوله درز دار نیکل و آلیاز نیکل کبالت	ASTM B 619
لوله و تیوب بدون درز نیکل و آلیاز نیکل کبالت	ASTM B 622
لوله درزدار نیکل (N02200/N02201) وآلیاژ نیکل مس	ASTM B 725

(N04400)	
الزامات عمومی برای لوله درزدار نیکل وآلیاژهای نیکل	ASTM B 775
الزامات عمومی برای لوله بدون درز نیکل وآلیاژهای نیکل	ASTM B 829

ADOPTION NOTICE

ANSI-A13.1, "Piping Systems, Scheme for the Identification Of," was adopted on October 3, 1994 for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Commanding Officer, Naval Construction Battalion Center, Code 156, 1000 23rd Avenue, Port Hueneme, CA 93043-4301. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from the American National Standards Institute, 11 West 42nd Street, New York, NY 10036.

AN AMERICAN NATIONAL STANDARD

SCHEME FOR THE IDENTIFICATION OF PIPING SYSTEMS

ASME A13.1-1996

(Revision of ASME A13.1-1981)

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:30:56 2005

Date of Issuance: January 31, 1997

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda issued to ASME A13.1-1996.

ASME issues written replies to inquiries concerning interpretation of technical aspects of this document. The interpretations are not part of the document. A13.1-1996 is being issued with an automatic subscription service to the interpretations that will be issued to it up to the publication of the next edition.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that the determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

ASME A13.1-1996

Following approval by the ASME A13 Committee and ASME, after public review, this ASME A13.1-1996 was approved by the American National Standards Institute on August 13, 1996.

SUMMARY OF CHANGES

ASME A13.1-1996 consists of A13.1-1981, as well as the following additional changes. The changes given below are identified on the page by a margin note **(96)**, placed on the affected area. The pages not listed do not contain changes.

FOREWORD

(This Foreword is not a part of ASME A13.1-1996.)

This is a revision of the Scheme for the Identification of Piping Systems, originally affirmed in 1928, reaffirmed in 1945, revised in 1956, revised in 1975, revised in 1981, reaffirmed in 1985 and 1993, and revised in 1996. (96)

Shortly after the turn of the century, with the resultant industrial expansion, it became apparent that some scheme should be devised to identify piping. In 1908, an article on "Identification of Power House Piping by Colors" was read at a meeting of The American Society of Mechanical Engineers. In 1909, an article called "Standard Colors for Power Station Piping" was read at the meeting of the Association of Edison Illuminating Companies.

In 1920, the National Safety News pointed out the need for a color scheme for pipe lines, and the following year several papers were published and reports made to various committees, notably the Prime Movers Committee of the National Electric Light Association, The American Society of Mechanical Engineers, and the U. S. Navy Department which actually wrote its specifications.

In the meantime, many large companies compiled their own scheme with no thought to standardization of pipe colors, even in their own plants. When personnel were shifted, accidents could and did happen.

The organization of the Sectional Committee on the Identification of Piping Systems, under the procedure of the American Standards Association (now called the American National Standards Institute, Inc.), took place on June 14, 1922. (96)

On August 23, 1950, the committee was reorganized to investigate the possibility of a revision to the standard. It was felt that a revision was necessary because of the tremendous number of different materials being carried in pipes. After many meetings and much discussion, this revision of American Standard, Scheme for Identification of Piping Systems, was approved by the sectional committee and sponsors. It was then presented to the American Standards Association (now called the American National Standards Institute, Inc.) for approval and designation as an American Standard. This was granted on January 27, 1956.

In the late 1960's the committee began discussions on the possibility of revising the 1956 Standard. These discussions continued for a number of years, eventually resulting in approval by the American National Standards Institute, Inc. and the secretariat. Approval by the American National Standards Institute, Inc. and designation as an American National Standard was obtained on November 16, 1981.

This latest edition of A13.1 was approved by the American National Standards Institute on August 13, 1996. (96)

Suggestions for improvement of this revision will be welcomed. They should be sent to The American Society of Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, N.Y., 10017.

INTRODUCTION

Purposes of Standardization

Schemes for identification of the contents of piping systems have been developed in the past by a large number of industrial plants and organizations of various kinds. Generally speaking, the standards arrived at in individual cases may have given satisfaction to those using them but they also may have suffered from a lack of uniformity. Numerous injuries to personnel and damage to property have occurred because of mistakes made in turning valves on, or disconnecting pipes at the wrong time or place, particularly when outside agencies, such as municipal fire departments, were called in to assist. Furthermore, there has been considerable confusion in the minds of those who change employment from one plant to another.

In order to promote greater safety, lessen the changes of error, confusion, or inaction, especially in times of emergency, a uniform system for the identification of piping contents has been established to warn personnel when the piping contents are inherently hazardous. Therefore, while this Standard has been prepared to specify the identification of the contents of piping systems on the basis of legends, it also suggests the use of color as a supplementary means of identifying the type of hazard of the material contained in the system.

SCHEME FOR THE IDENTIFICATION OF PIPING SYSTEMS

1 OBJECT AND SCOPE

1.1 This Standard is intended to establish a common system to assist in identification of hazardous materials conveyed in piping systems and their hazards when released in the environment.

1.2 This scheme concerns identification of contents of piping systems in industrial and power plants. It is also recommended for the identification of piping systems used in commercial and institutional installations, and in buildings used for public assembly. It does not apply to pipes buried in the ground nor to electrical conduits.

1.3 Existing schemes for identification shall be considered acceptable if such schemes are described in writing and implemented so that the using facility can demonstrate that the basic concerns outlined in this Standard are being met. For example, petroleum refineries and primary chemical manufacturing plants, in which hazardous work permit systems and emergency procedure manuals are utilized, wherein effective methods for the identification of pipe contents have been established, and wherein employees are trained as to the operation and hazards of the piping systems, shall be considered as meeting the requirements of this Standard.

(96) 2 DEFINITIONS AND REFERENCES

2.1 Piping Systems

For the purpose of this Standard, piping systems shall include pipes of any kind and, in addition, fittings, valves, and pipe coverings. Supports, brackets, or other accessories are specifically excluded from applications of this Standard. Pipes are defined as conduits for the transport of gases, liquids, semiliquids, or fine particulate dust.

2.2 Materials Inherently Hazardous

2.2.1 Flammable or Explosive. This classification includes materials which are easily ignited. It includes materials known as fire producers or those creating an explosive atmosphere.

2.2.2 Chemically Active or Toxic. This classification includes materials which are corrosive, or are in themselves toxic or productive of poisonous gases.

2.2.3 At Temperatures or Pressures. This classification includes materials which when released from the piping would have a potential for inflicting injury or property damage by burns, impingement, or flashing to vapor state.

2.2.4 Radioactive. This classification includes those materials which emit ionizing radiation.

2.3 Materials of Inherently Low Hazard

This classification includes all materials which are not hazardous by nature, and are near enough to ambient pressure and temperature that people working on systems carrying these materials run little risk through the release of these materials.

2.4 Fire Quenching Materials

This classification includes sprinkler systems and other piped fire fighting or fire protection equipment. This includes water (for fire fighting), foam, CO_2, Halon, etc.

2.5 References (96)

This Standard is supplemented by the following standard. Since revisions in and additions to this Standard do occur, the edition bearing the latest date of issue shall be used. It is expected that best current practice will prevail.

The following standard shall, to the extent specified herein, form a part of this Standard.

ANSI Z535.1 Safety Color Code

TABLE 1 EXAMPLES OF LEGEND

"HOT WATER"	"HYDRAULIC OIL"
"SLURRY"	"FOAM"
"AIR 100 PSIG"	"CARBON TETRACHLORIDE"
"ARGON 500 PSIG"	"CAUSTIC"
"PROPANE"	"SULFURIC ACID"
"H. P. RETURN"	"STEAM 100 PSIG"

3 METHOD OF IDENTIFICATION

3.1 Legend

This Standard considers legend to be primary and explicit for identification of contents. Positive identification of the contents of a piping system shall be by lettered legend giving the name of the contents in full or abbreviated form (see Table 1). Arrows shall be used to indicate direction of flow. Contents shall be identified by legend with sufficient additional details such as temperature, pressure, etc., as are necessary to identify the hazard.

Legend shall be brief, informative, pointed, and simple for greatest effectiveness. Legends shall be applied close to valves or flanges and adjacent to changes in direction, branches, and where pipes pass through walls or floors; and at intervals on straight pipe runs sufficient for identification. Identification may be accomplished by stenciling, the use of tape, or markers. In any situation, the number and location of identification markers shall be based on the particular piping system. (See Fig. 1.)

3.2 Color

Color should be used to identify the characteristic hazards of the contents (see Table 2). Color should be displayed on, or contiguous to, the piping by any physical means, but its use shall be in combination with legend. Color may be used in continuous, total length coverage or in intermittent displays.

3.3 Visibility

Attention shall be given to visibility with reference to pipe markings. Where pipe lines are located above or below the normal line of vision, the lettering shall be placed below or above the horizontal centerline of the pipe.

3.4 Type and Size of Letters

Contrast shall be provided between color field and legend for readability. Table 2 gives recommendations for color of legend on various color fields covered in this Standard. Use of letters of standard style,[1] in sizes 1/2 in. (13 mm) and larger, is recommended. Refer to Table 3 for specific size recommendations. For identification of materials in pipes of less than 3/4 in. (19 mm) in diameter, and for valve and fitting identification, the use of a permanently legible tag is recommended.

[1] Sans serif gothic bold lettering provides high readability.

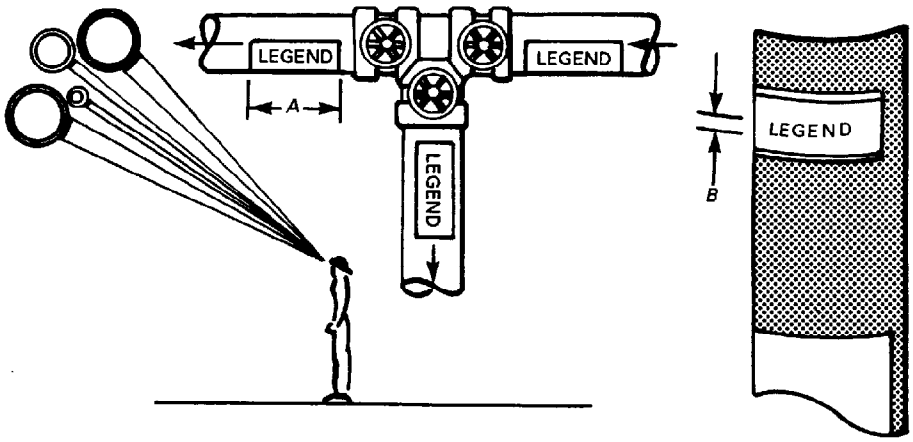

FIG. 1

Wed Feb 02 00:30:57 2005

TABLE 2
CLASSIFICATION OF HAZARDS OF MATERIALS AND DESIGNATION OF COLORS[1]

Classification	Color Field	Color of Letters for Legend
Materials Inherently Hazardous		
Flammable or Explosive	Yellow	Black
Chemically Active or Toxic	Yellow	Black
Extreme Temperatures or Pressures	Yellow	Black
Radioactive[2]	Yellow	Black
Materials of Inherently Low Hazard		
Liquid or Liquid Admixture[3]	Green	White
Gas or Gaseous Admixture	Blue	White
Fire Quenching Materials		
Water, Foam, CO_2, Halon, etc.	Red	White

(96) NOTES:

(1) When the color scheme above is used, the colors should be as recommended in ANSI Z535.1 latest revision, Safety Color Code.

(2) Previously specified radioactive markers using yellow and purple are acceptable if already installed and/or until existing supplies are depleted, subject to pertinent Federal Regulations.

(3) Markers with black letters on a green color field are acceptable if already installed and/or until existing supplies are depleted.

TABLE 3 SIZE OF LEGEND LETTERS

Outside Diameter of Pipe or Covering		Length of Color Field A		Size of Letters B	
in.	mm	in.	mm	in.	mm
¾ to 1¼	19 to 32	8	200	½	13
1½ to 2	38 to 51	8	200	¾	19
2½ to 6	64 to 150	12	300	1¼	32
8 to 10	200 to 250	24	600	1½	64
over 10	over 250	32	800	3½	89

3.5 Unusual or Extreme Situations

When the piping layout creates or occurs in a limited area of inaccessibility or of extreme complexity, such segments of layouts may require substitute techniques to achieve positive identification. Use of substitute techniques shall be limited to such segments and shall not deviate from the concept of identification described in 3.1, "Legend," 3.2, "Color," and Table 2, "Classification of Hazards of Materials and Designation of Colors."

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda or written interpretations of the requirements of this Standard issued to this edition.

ASME is the registered trademark of the American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a code or standard are expressly advised that the determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,

FOREWORD

In March 1927, the American Standards Association authorized the organization of a Sectional Committee on Standardization of Dimensions and Material of Wrought Steel and Wrought Iron Pipe and Tubing for the purpose of unifying the standards of these commodities in force in this country. The American Society for Testing and Materials and The American Society of Mechanical Engineers were designated as sponsors, and the first meeting of the Sectional Committee was held in Pittsburgh, Pennsylvania, on May 18, 1928.

The dimensions of commercial pipe in general use in the United States at the time conformed rather generally to those recommended by the ASME Committee on Standard Pipe and Pipe Threads published in 1886 (ASME Transactions, Vol. VIII, p. 29). On these standards an enormous industry has been built and the satisfactory use of this product proves the soundness of the original design and specification.

Increasingly severe service demands at the time of the Committee's organization had been met by using the nearest available pipe or tubing for heavier sections such as casing, mechanical tubing, etc., with resulting uneconomical multiplicity of wall thicknesses.

Subsequently, the Committee, with the cooperation of the industry, made a survey of existing practice as the logical starting point for the development of an American Standard. From this survey, a table was designed to provide a selection of wall thicknesses of pipe to cover the power piping requirements of industry where strength to resist internal pressure governs selection and was later expanded to include pipe diameters and thicknesses used in other industries.

The original intent of the Committee was to establish a system of Schedule Numbers for pipe size/wall thickness combinations which would have an approximately uniform relationship equal to 1000 times the *P/S* expression contained in the modified Barlow formula for pipe wall thickness as defined in the Appendix to this standard. The resulting Numbers departed so far from existing wall thicknesses in common use that the original intent could not be accomplished. The Schedule Numbers were then adopted strictly as a convenient designation system for use in ordering.

In all cases, the designer must base his selection on the rules and allowable stresses set by the code which governs his particular construction. The table is dimensionally complete for all sizes and wall thicknesses within its scope, but some of the larger, heavier wall sections are beyond the capability of seamless mill production and must be obtained from forged and bored billets or other sources.

The first issue of this standard was given with the designation American Standard "tentative" by the American Standards Association in November 1935. Subsequent slight revisions to Table 1 and the footnotes of the dimensional tables were approved and the ASA changed the designation to American Standard; the date of ASA approval was April 28, 1939.

Further revisions were made by the Sectional Committee. The list of specifications in Table 1 was revised where necessary and slight revisions in wall thicknesses of some of the large sizes of the heavy schedules were made where *P/S* values were out of line.

It was the hope in 1939 that the designation of pipe used commercially by all industry as Standard weight, Extra-Strong, and Double Extra-Strong would gradually be replaced by Schedule Number designation. However, owing to customs of over 50 years' standing,

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:33:15 2005

demand and production of pipe to these traditional dimensions is undiminished. Consequently, in response to a demand from users, accepted practice for dimensions and weights of commercial wrought steel and welded wrought iron pipe were added. These changes were designated an American Standard on February 23, 1950.

Subcommittee No. 1 was reorganized in 1957. In addition to necessary editorial changes, a simplified format was selected for the tables of weights and dimensions so as to include and identify the sizes and weights of API Standards 5L and 5LX. These changes to the standard were approved and it was designated an American Standard on December 21, 1959.

The standard was revised in 1969. A uniform method to calculate the plain end weight of steel pipe was included, and minor adjustments were made in the tabulated weights of steel pipe in Table 2 to conform to this new method. Additional sizes and thicknesses of steel pipe that had come into common use were also added to Table 2. Inasmuch as API Standard 5L no longer included wrought iron pipe, reference to this API Standard was deleted from Table 3. These changes to the standard were approved and it was designated an American National Standard on February 3, 1970.

Further revisions were made to the standard in 1975. Additional sizes and thicknesses of steel pipe that had been added to API specifications were added to Table 2. Table 3, Dimensions and Weights of Welded Wrought Iron Pipe, was deleted in its entirety, since wrought iron pipe is no longer produced. These changes in the standard were approved and it was designated an American National Standard on June 5, 1975.

The standard was revised in 1978 to include SI metric dimensions. The outside diameter and wall thicknesses were converted to millimeters by multiplying the inch dimensions by 25.4. Outside diameters larger than 16 in. were rounded to the nearest millimeter, and outside diameters 16 in. and smaller were rounded to the nearest 0.1 mm. Wall thicknesses were rounded to the nearest 0.01 mm. These converted and rounded SI metric dimensions were added to Table 2. A formula to calculate the SI metric plain end mass, in kilograms per meter, using SI metric diameters and thicknesses was added to section 5. The SI metric plain end mass was calculated and was added to Table 2. These changes in the standard were approved and it was designated an American National Standard on July 18, 1979.

Further revisions were made in 1984. The ANSI designations, which are no longer in use, were deleted from Table 1, and the list of specifications was revised to agree with current ASTM and API specifications. Additional sizes and thicknesses which had been added to API specifications were added to Table 2. That edition was approved as an American National Standard on August 19, 1985.

The next edition included additional wall thicknesses and was approved by the American National Standards Institute on August 24, 1995.

The 1996 edition contained revisions to Table 2, adding pipe sizes, changing some plain end weights and masses, identifying metric pipe by the dimensionless designator DN, and eliminating the API Specification column. The 1996 edition was approved as an American National Standard on September 23, 1996.

The current edition contains revisions to Table 2 to include the revised density for steel incorporated into Section 5 previously. Table 1 was deleted and other editorial changes to Sections 1, 2, 3, 5, 8, and 9 were made. This edition was approved as an American National Standard on December 1, 2000.

WELDED AND SEAMLESS WROUGHT STEEL PIPE

1 SCOPE

This Standard covers the standardization of dimensions of welded and seamless wrought steel pipe for high or low temperatures and pressures.

The word *pipe* is used as distinguished from *tube* to apply to tubular products of dimensions commonly used for pipeline and piping systems. Pipe NPS 12 (DN 300) and smaller have outside diameters numerically larger than their corresponding sizes. In contrast, the outside diameters of tubes are numerically identical to the size number for all sizes.

2 SIZE

The size of all pipe is identified by the nominal pipe size.

The manufacture of pipe NPS $\frac{1}{8}$ (DN 6) to NPS 12 (DN 300) inclusive is based on a standardized outside diameter (OD). This OD was originally selected so that pipe with a standard OD and having a wall thickness that was typical of the period would have an inside diameter (ID) approximately equal to the nominal size. Although there is no such relation between the existing standard thickness — OD and nominal size — these nominal sizes and standard ODs continue in use as "standard."

The manufacture of pipe NPS 14 (DN 350) and larger proceeds on the basis of an OD corresponding to the nominal size.

3 MATERIALS

The dimensional standards for pipe described here are for products covered in ASTM specifications.

4 WALL THICKNESS

The nominal wall thicknesses are given in Table 1.

5 WEIGHTS

The nominal weights of steel pipe are calculated values and are tabulated in Table 1.

The nominal plain end weight, in pounds per foot, is calculated using the following formula:

$$W_{pe} = 10.69(D - t)t$$

where

W_{pe} = nominal plain end weight rounded to the nearest 0.01 lb/ft
D = outside diameter to the nearest 0.001 in. (the symbol D is to be used for OD only in mathematical equations or formulas)
t = specified wall thickness rounded to the nearest 0.001 in.

The nominal plain end mass, in kilograms per meter, is calculated using the following formula:

$$W_{pe} = 0.0246615(D - t)t$$

where

W_{pe} = nominal plain end weight rounded to the nearest 0.01 kg/m
D = outside diameter to the nearest 0.1 mm for outside diameters that are 16 in. (406.4 mm) and smaller and to the nearest 1.0 mm for outside diameters larger than 16 in. (406.4 mm) (the symbol D is to be used for OD only in mathematical equations or formulas)
t = specified wall thickness rounded to the nearest 0.01 mm

6 PERMISSIBLE VARIATIONS

Variations in dimensions differ depending upon the method of manufacture employed in making the pipe to the various specifications available. Permissible variations for dimensions are indicated in each specification.

7 PIPE THREADS

Unless otherwise specified, the threads of threaded pipe shall conform to ANSI/ASME B1.20.1, Pipe Threads, General Purpose (Inch).

Schedules 5 and 10 wall thicknesses do not permit threading in accordance with ANSI/ASME B1.20.1.

8 WALL THICKNESS DESIGNATIONS

The wall thickness designations Standard, Extra-Strong, and Double Extra-Strong have been commercially used designations for many years. As explained in the Foreword, the Schedule Numbers were subsequently added as a convenient designation for use in ordering pipe. Standard and Schedule 40 are identical for up to NPS 10 (DN 250) inclusive. All larger sizes of Standard have $\frac{3}{8}$ in. (9.53 mm) wall thicknesses. Extra-Strong and Schedule 80 are identical for up to NPS 8 (DN 200) inclusive. All larger sizes of Extra-Strong have $\frac{1}{2}$ in. (12.70 mm) wall thicknesses.

Pipe of sizes and wall thicknesses other than those of Standard, Extra-Strong, and Double Extra-Strong, and Schedule Number were adopted from API Specification 5L. It was not considered practical to establish Schedule Numbers or new designations for them.

9 WALL THICKNESS SELECTION

When the selection of wall thickness depends primarily upon capacity to resist internal pressure under given conditions, the designer shall compute the exact value of wall thickness suitable for conditions for which the pipe is required, as prescribed in detail in the ASME Boiler and Pressure Vessel Code, ASME B31 Code for Pressure Piping, or other similar codes, whichever governs the construction. A thickness shall be selected from Table 1 to suit the value computed to fulfill the conditions for which the pipe is desired.

NOTES:
(1) NPS (Nominal Pipe Size) is a dimensionless designator that has been substituted in the customary units section for the previous term *Inch Nominal Size.*
(2) DN (Nominal Diameter) is a dimensionless designator used in the SI (metric) system to describe pipe size.

SPECIAL NOTES

API publications necessarily address problems of a general nature. With respect to particular circumstances, local, state, and federal laws and regulations should be reviewed.

API is not undertaking to meet the duties of employers, manufacturers, or suppliers to warn and properly train and equip their employees, and others exposed, concerning health and safety risks and precautions, nor undertaking their obligations under local, state, or federal laws.

Information concerning safety and health risks and proper precautions with respect to particular materials and conditions should be obtained from the employer, the manufacturer or supplier of that material, or the material safety data sheet.

Nothing contained in any API publication is to be construed as granting any right, by implication or otherwise, for the manufacture, sale, or use of any method, apparatus, or product covered by letters patent. Neither should anything contained in the publication be construed as insuring anyone against liability for infringement of letters patent.

Generally, API standards are reviewed and revised, reaffirmed, or withdrawn at least every five years. Sometimes a one-time extension of up to two years will be added to this review cycle. This publication will no longer be in effect five years after its publication date as an operative API standard or, where an extension has been granted, upon republication. Status of the publication can be ascertained from the API Upstream Segment [telephone (202) 682-8000]. A catalog of API publications and materials is published annually and updated quarterly by API, 1220 L Street, N.W., Washington, D.C. 20005.

This document was produced under API standardization procedures that ensure appropriate notification and participation in the developmental process and is designated as an API standard. Questions concerning the interpretation of the content of this standard or comments and questions concerning the procedures under which this standard was developed should be directed in writing to the general manager of the Upstream Segment, American Petroleum Institute, 1220 L Street, N.W., Washington, D.C. 20005. Requests for permission to reproduce or translate all or any part of the material published herein should also be addressed to the general manager.

API standards are published to facilitate the broad availability of proven, sound engineering and operating practices. These standards are not intended to obviate the need for applying sound engineering judgment regarding when and where these standards should be utilized. The formulation and publication of API standards is not intended in any way to inhibit anyone from using any other practices.

Any manufacturer marking equipment or materials in conformance with the marking requirements of an API standard is solely responsible for complying with all the applicable requirements of that standard. API does not represent, warrant, or guarantee that such products do in fact conform to the applicable API standard.

All rights reserved. No part of this work may be reproduced, stored in a retrieval system, or transmitted by any means, electronic, mechanical, photocopying, recording, or otherwise, without prior written permission from the publisher. Contact the Publisher, API Publishing Services, 1220 L Street, N.W., Washington, D.C. 20005.

FOREWORD

Specification 5L covers seamless and welded steel line pipe. It includes plain-end, threaded-end, and belled-end pipe, as well as through-the-flowline (TFL) pipe and pipe with ends prepared for use with special couplings.

Although the plain-end line pipe meeting this specification is primarily intended for field makeup by circumferential welding, the manufacturer will not assume responsibility for field welding.

The purpose of this specification is to provide standards for pipe suitable for use in conveying gas, water, and oil in both the oil and natural gas industries.

This specification is under the jurisdiction of the Committee on Standardization of Tubular Goods and includes changes to the previous edition approved by letter ballot through June 1999. Specifications 5LS and 5LX have been incorporated into this edition of Specification 5L. The last editions of Specifications 5LS and 5LX, published in March 1982, have been withdrawn.

Due to the large numbers of changes from the Forty-first Edition, change bars are not included in this edition.

This standard shall become effective on the date printed on the cover but may be used voluntarily from the date of distribution.

API publications may be used by anyone desiring to do so. Every effort has been made by the Institute to assure the accuracy and reliability of the data contained in them; however, the Institute makes no representation, warranty, or guarantee in connection with this publication and hereby expressly disclaims any liability or responsibility for loss or damage resulting from its use or for the violation of any federal, state, or municipal regulation with which this publication may conflict.

Suggested revisions are invited and should be submitted to the general manager of the Upstream Segment, American Petroleum Institute, 1220 L Street, N.W., Washington, D.C. 20005.

Specification for Line Pipe

1 Scope

1.1 PURPOSE AND COVERAGE

The purpose of this specification is to provide standards for pipe suitable for use in conveying gas, water, and oil in both the oil and natural gas industries.

This specification covers seamless and welded steel line pipe. It includes plain-end, threaded-end, and belled-end pipe, as well as through-the-flowline (TFL) pipe and pipe with ends prepared for use with special couplings.

Although the plain-end line pipe meeting this specification is primarily intended for field makeup by circumferential welding, the manufacturer will not assume responsibility for field welding.

1.2 PRODUCT SPECIFICATION LEVEL (PSL)

This specification establishes requirements for two product specification levels (PSL 1 and PSL 2). These two PSL designations define different levels of standard technical requirements. PSL 2 has mandatory requirements for carbon equivalent, notch toughness, maximum yield strength, and maximum tensile strength. These and other differences are summarized in Appendix J.

Requirements that apply to only PSL 1 or only PSL 2 are so designated. Requirements that are not designated to a specific PSL apply to both PSL 1 and PSL 2.

The purchaser may add requirements to purchase orders for either PSL 1 or PSL 2, as provided by the supplementary requirements (Appendix F) and other options (4.2 and 4.3).

1.3 GRADES

The grades (see the note) covered by this specification are the standard Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70 and X80; and any intermediate grades (grades that are higher than X42, intermediate to two sequential standard grades, and agreed upon by the purchaser and manufacturer).

PSL 1 pipe can be supplied in Grades A25 through X70.
PSL 2 pipe can be supplied in Grades B through X80.

Class II (Cl II) steel is rephosphorized and probably has better threading properties than Class I (Cl I). Because Class II (Cl II) has higher phosphorus content than Class I (Cl I), it may be somewhat more difficult to bend.

Pipe manufactured as Grade X60 or higher shall not be substituted for pipe ordered as Grade X52 or lower without purchaser approval.

Note: The grade designations are dimensionless. Grades A and B do not include reference to the specified minimum yield strength; however, other grade designations are composed of the letter A or X, followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

1.4 DIMENSIONS

The sizes used herein are dimensionless designations, which are derived from the specified outside diameter as measured in U.S. Customary units, and provide a convenient method of referencing pipe size within the text and tables (but not for order descriptions). Pipe sizes $2^3/_8$ and larger are expressed as integers and fractions; pipe sizes smaller than $2^3/_8$ are expressed to three decimal places. These sizes replace the "size designation" and the "nominal size designation" used in the previous edition of this specification. Users of this specification who are accustomed to specifying nominal sizes rather than OD sizes are advised to familiarize themselves with these new size designations used in this specification, especially the usage in Tables 4, 5, and 6A.

PSL 1 pipe can be supplied in sizes ranging from 0.405 through 80.
PSL 2 pipe can be supplied in sizes ranging from $4^1/_2$ through 80.

Dimensional requirements on threads and thread gages, stipulations on gaging practice, gage specifications and certification, as well as instruments and methods for inspection of threads are given in API Standard 5B and are applicable to threaded products covered by this specification.

1.5 UNITS

U.S. Customary units are used in this specification; SI (metric) units are shown in parentheses in the text and in many tables. The values stated in either U.S. Customary units or SI units are to be regarded separately as standard. The values stated are not necessarily exact equivalents; therefore, each system is to be used independently of the other, without combining values for any specific order item.

See Appendix M for specific information about rounding procedures and conversion factors.

3 Definitions

For the purposes of this specification, the following definitions apply:

3.1 carload: The quantity of pipe loaded on a rail car for shipment from the pipe-making facilities.

3.2 defect: An imperfection of sufficient magnitude to warrant rejection of the product based on the stipulations of this specification.

3.3 heat: The metal produced by a single cycle of a batch melting process.

3.4 heat analysis: The chemical analysis representative of a heat as reported by the metal producer.

3.5 imperfection: A discontinuity or irregularity in the product detected by methods outlined in this specification.

3.6 inspection lot: A definite quantity of product manufactured under conditions that are considered uniform for the attribute to be inspected.

3.7 manufacturer: A firm, company, or corporation responsible for marking the product to warrant that it conforms to this specification. The manufacturer may be, as applicable, a pipe mill or processor; a maker of couplings; or a threader. The manufacturer is responsible for compliance with all of the applicable provisions of this specification.

3.8 may: Used as a verb to indicate that a provision is optional.

3.9 pipe mill: A firm, company, or corporation that operates pipe-making facilities.

3.10 processor: A firm, company, or corporation that operates facilities capable of heat treating pipe made by a pipe mill.

3.11 product analysis: A chemical analysis of the pipe, plate, or skelp.

3.12 PSL: Abbreviation for product specification level.

3.13 shall: Used to indicate that a provision is mandatory.

3.14 should: Used to indicate that a provision is not mandatory but is recommended as good practice.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:33 2005

3.15 special processes: Final operations performed during pipe manufacturing that affect attribute compliance required in this specification (except chemistry and dimensions). The applicable special processes are as follows:

Manufacturing Condition	Special Processes
a. Seamless:	
1. As-rolled (nonexpanded)	Final reheating and hot sizing or stretch reduction. Cold finishing, if applied, and repair welding. Nondestructive inspection.
2. As-rolled (expanded)	Expansion, nondestructive inspection, and repair welding.
3. Heat treated	Heat treatment, nondestructive inspection, and repair welding.
b. Welded without filler metal:	
1. As-rolled (nonexpanded)	Seam welding, nondestructive inspection and sizing. If applicable, seam heat treatment and repair welding.
2. As-rolled (expanded)	Seam welding, expansion, and nondestructive inspection. If applicable, seam heat treatment, and repair welding.
3. Heat treated	Seam welding, full body heat treatment, and nondestructive inspection. If applicable, repair welding.
c. Welded with filler metal:	
1. As-rolled (nonexpanded)	Pipe forming, seam welding, nondestructive inspection, and repair welding.
2. As-rolled (expanded)	Seam welding, expansion, nondestructive inspection, and repair welding.
3. Heat treated	Seam welding, nondestructive inspection, repair welding, and full body heat treatment.
4. As-rolled	Seam welding, sizing, and nondestructive inspection.

4 Information to be Supplied by the Purchaser (See Note 1)

4.1 In placing orders for line pipe to be manufactured in accordance with API Spec 5L, the purchaser should specify the following on the purchase order:

Information	Reference
Specification	API Spec 5L
PSL (Product Specification Level)	Paragraph 1.2 and Table 1
Quantity	
Grade (and class, if applicable)	Tables 2 and 3
Type of pipe	Paragraph 5.1.3
Size or outside diameter	Paragraph 7.1
Wall thickness	Paragraph 7.1
Nominal length	Paragraph 7.5 and Table 11
End finish	Paragraph 7.9
Delivery date and shipping instructions	

4.2 The purchaser should also state on the purchase order his requirements concerning the following stipulations, which are optional with the purchaser:

Information	Reference
Certificate of compliance, general	Paragraph 12.1
Certificate of compliance, with test results	Paragraph 12.1 and SR 15
Cold expanded or nonexpanded pipe	Paragraph 5.2
High carbon equivalent pipe	Paragraph 6.1.3.2
Optional fracture toughness: test type, temperature, and Charpy energy value	Paragraph 6.2.6; SR5; SR6; SR19
Acceptance and maximum percent of jointers	Paragraph 7.7
Jointers for threaded pipe	Paragraph 7.7
Thread compound	Paragraph 7.9.2
Reduced negative tolerance for wall thickness	Tables 9 and 10
Power-tight makeup	Paragraph 7.9.2
Specific edition of Spec 5L for pipe and couplings	Paragraph 7.9.2
Alternative bevel or end preparation, plain-end pipe	Paragraph 7.9.3

Information	Reference
Alternative minimum hydrostatic test pressure	Paragraph 9.4.3
Hydrostatic test pressure, maximum	Paragraph 9.4.3
Special inspection of electric welded seams	Paragraph 9.7.2.2 and SR17
Alternative inspection of laser welded seams	Paragraph 9.7.2.3 and SR17
Nondestructive testing of seamless pipe	Paragraph 9.7.2.6 and SR4
Type of penetrameter for radiological inspection	Paragraph 9.7.3.4
Bare pipe; temporary and special coatings	Paragraph 11.1
Special nondestructive inspection for laminations	Paragraph 7.8.10
Demonstration of capability of magnetic particle inspection method	Paragraph 9.7.5.2
Through-the-Flowline (TFL) Pipe	SR7
Length tolerance and jointer allowance for TFL pipe	Paragraph SR7.2
Marking Requirements	
Alternative length units	Paragraphs 10.5 and I.5
Additional markings for compatible standards	Paragraphs 10.1.3 and I.1.3
Marking location and sequence for welded pipe, size 16 and larger	Paragraphs 10.2c and I.2.3
Die stamping of pipe or plate	Paragraphs 10.7 and I.7
Method of welding jointers	Paragraph A.1
Purchaser inspection	Paragraph 9.7.1 and Appendix H
Inspection location	Paragraph H.2
Monogram marking (see Note 2)	Paragraph I.1

4.3 The following stipulations are subject to agreement between the purchaser and the manufacturer:

Information	Reference
Alternative heat treatment for electric weld seams	Paragraph 5.1.3.3
Alternative heat treatment for laser weld seams	Paragraph 5.1.3.4
Quenching and tempering of Grade B pipe	Paragraph 5.4
Skelp end welds at pipe ends	Paragraph 5.5
Chemical composition	Paragraph 6.1.1
Intermediate grade	Paragraphs 6.1.1 and 6.2.1
Carbon equivalent limit (PSL 2)	
Grade X80	Paragraph 6.1.3.2
Seamless with wall thickness > 0.800 in (20.3 mm)	Paragraph 6.1.3.2
High carbon equivalent pipe	Paragraph 6.1.3.2
Charpy specimen size for optional fracture toughness	Paragraph SR5.3
Type of notch for drop weight tear test specimens	SR6.3
Internal diameter tolerance	Paragraph 7.2
Intermediate diameter	Paragraph 7.1
Intermediate wall thickness	Paragraph 7.1
Skelp end welds at jointer welds	Paragraph 7.7
Hydrostatic test for threaded and coupled pipe	Paragraph 9.4.1
Higher hydrostatic test pressure	Paragraph 9.4.3
End load compensation for hydrotest producing stress > 90% SMYS	Paragraph 9.4.3 and Appendix K
Supplementary hydrostatic test	Paragraph 9.4.4
Diameter tolerance for nonstandard hydrotest	Table 7
Alternative nondestructive test method for seams at ends of electric welded pipe	Paragraph 9.7.2.2
Alternative nondestructive test method for seams at ends of laser welded pipe	Paragraph 9.7.2.3
Alternative penetrameter for radiological inspection	Paragraph 9.7.3.4
Alternative reinspection method for gas-metal-arc welds	Paragraph 9.7.4.3
Alternative reference standard for nondestructive inspection of seamless	Paragraph SR4.3.2
Technique for nondestructive inspection of electric welds and laser welds	Paragraph SR17.2
Length tolerances applied to carloads	Table 11
Nonstandard length and length tolerances	Paragraph 7.5
Welded couplings	Paragraph 8.1

Information	Reference
NDT for repair of pipe body by welding	Paragraph B.1.1
Repair of weld seams of electric welded pipe	Paragraphs 9.7.4.4 and B.1.2
Repair of weld seams of laser welded pipe	Paragraphs 9.7.4.4 and B.1.2
Repair of heat-treated pipe by welding	Paragraph B.1.3
Reprocessing by heat-treatment	Paragraphs 9.11 and SR5.4
Disposition of product rejected by purchaser	Paragraph H.4
Marking requirements	
Marking of couplings without die stamping	Paragraphs 10.1.2 and I.1.2
Marking on interior instead of exterior (welded pipe < size 16, and seamless pipe)	Paragraphs 10.2b and I.2.2
Color code marking for grade	Paragraphs 10.3.5 and I.3.5; SR3
Nonstandard units of length	Paragraphs 10.5 and I.5
Location for length markings	Paragraphs 10.5a and I.5a
Use of cold die stamping	Paragraphs 10.7 and I.7

Notes:

1. Nothing in this specification should be interpreted as indicating a preference by the committee for any material or process or as indicating equality between the various materials or processes. In the selection of materials and processes, the purchaser has to be guided by experience and by the service for which the pipe is intended.
2. Users of this specification should note that there is no longer a requirement for marking a product with the API monogram. The American Petroleum Institute continues to license use of the monogram on products covered by this specification, but it is administered by the staff of the Institute separately from the specification. The policy describing use of the monogram is contained in Appendix I. No other use of the monogram is permitted. Licensees mark products in accordance with Appendix I or Section 10, and nonlicensees mark products in accordance with Section 10.

5 Process of Manufacture and Material

5.1 PROCESS OF MANUFACTURE

Pipe furnished to this specification shall be either seamless or welded as defined in 5.1.1, 5.1.2, and 5.1.3 and shall be limited to the product specification levels, grades, types of pipe, and size limitations specified in Table 1.

5.1.1 Seamless Process

The seamless process is a process of hot working steel to form a tubular product without a welded seam. If necessary, the hot worked tubular product may be subsequently cold finished to produce the desired shape, dimensions, and properties.

5.1.2 Welding Processes

5.1.2.1 Without Filler Metal

5.1.2.1.1 Continuous Welding

Continuous welding is a process of forming a seam by heating the skelp in a furnace and mechanically pressing the formed edges together wherein successive coils of skelp have been joined together to provide a continuous flow of steel for the welding mill. (This process is a type of butt-welding.)

5.1.2.1.2 Electric Welding

Electric welding is a process of forming a seam by electric-resistance or electric-induction welding wherein the edges to be welded are mechanically pressed together and the heat for welding is generated by the resistance to flow of the electric current.

5.1.2.1.3 Laser Welding

Laser welding is a welding process that uses a laser beam and a keyholing technique to produce melting and coalescence of the edges to be welded. The edges may be preheated. Shielding is obtained entirely from an externally supplied gas or gas mixture.

5.1.2.2 With Filler Metal

5.1.2.2.1 Submerged-Arc Welding

Submerged-arc welding is a welding process that produces coalescence of metals by heating them with an arc or arcs between a bare metal consumable electrode or electrodes and the work. The arc and molten metal are shielded by a blanket of granular, fusible material on the work. Pressure is not used, and part or all of the filler metal is obtained from the electrodes.

5.1.2.2.2 Gas Metal-Arc Welding

Gas metal-arc welding is a welding process that produces coalescence of metals by heating them with an arc or arcs between a continuous consumable electrode and the work. Shielding is obtained entirely from an externally supplied gas or gas mixture. Pressure is not used, and the filler metal is obtained from the electrode.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:34 2005

5.1.3 Types of Pipe

5.1.3.1 Seamless Pipe

Seamless pipe is produced by the seamless process defined in 5.1.1.

5.1.3.2 Continuous Welded Pipe

Continuous welded pipe is defined as pipe that has one longitudinal seam produced by the continuous welding process defined in 5.1.2.1.1. (This is a type of butt-welded pipe.)

5.1.3.3 Electric Welded Pipe

Electric welded pipe is defined as pipe that has one longitudinal seam produced by the electric welding process defined in 5.1.2.1.2.

5.1.3.3.1 PSL 1 Electric Welded Pipe

For grades higher than X42, the weld seam and the entire heat affected zone shall be heat treated so as to simulate a normalizing heat treatment (see note), except that by agreement between the purchaser and the manufacturer alternative heat treatments or combinations of heat treatment and chemical composition may be substituted. Where such substitutions are made, the manufacturer shall demonstrate the effectiveness of the method selected using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing. For grades X42 and lower, the weld seam shall be similarly heat treated, or the pipe shall be processed in such a manner that no untempered martensite remains.

Note: During the manufacture of electric welded pipe, the product is in motion through the surrounding air. Normalizing is usually defined with "cooling in still air;" hence the phrase "to simulate a normalizing heat treatment" is used here.

5.1.3.3.2 PSL 2 Electric Welded Pipe

Electric welding shall be performed with a minimum welder frequency of 100 kHz.

For all grades, the weld seam and the entire heat affected zone shall be heat treated so as to simulate a normalizing heat treatment (see note in 5.1.3.3.1), except that by agreement between the purchaser and the manufacturer alternative heat treatments or combinations of heat treatment and chemical composition may be substituted. Where such substitutions are made, the manufacturer shall demonstrate the effectiveness of the method selected using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing.

5.1.3.4 Laser Welded Pipe

Laser welded pipe is defined as pipe that has one longitudinal seam produced by the laser welding process defined in 5.1.2.1.3.

The weld seam and the entire heat affected zone of laser welded pipe shall be heat treated so as to simulate a normalizing heat treatment, except that by agreement between the purchaser and manufacturer, an alternative process may be substituted. Where such substitution is made, the manufacturer shall demonstrate the effectiveness of the method selected, using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing.

Note: During the manufacture of laser welded pipe, the product is in motion through the surrounding air. Normalizing is usually defined with "cooling in still air;" hence the phrase "to simulate a normalizing heat treatment" is used here.

5.1.3.5 Longitudinal Seam Submerged-Arc Welded Pipe

Longitudinal seam submerged-arc welded pipe is defined as pipe that has one longitudinal seam produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. At least one pass shall be on the inside and at least one pass shall be on the outside. (This type of pipe is also known as submerged-arc welded pipe.)

5.1.3.6 Gas Metal-Arc Welded Pipe

Gas metal-arc welded pipe is defined as pipe that has one longitudinal seam produced by the continuous gas metal-arc welding process defined in 5.1.2.2.2. At least one pass shall be on the inside and at least one pass shall be on the outside.

5.1.3.7 Combination Gas Metal-Arc and Submerged-Arc Welded Pipe

Combination gas metal-arc and submerged-arc welded pipe is defined as pipe that has one longitudinal seam produced by a combination of the welding processes defined in 5.1.2.2.1 and 5.1.2.2.2. The gas metal-arc welding process shall be continuous and first, and followed by the automatic submerged-arc welding process with at least one pass on the inside and at least one pass on the outside.

5.1.3.8 Double Seam Submerged-Arc Welded Pipe

Double seam submerged-arc welded pipe is defined as pipe that has two longitudinal seams produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. The seams shall be approximately 180° apart. For each seam, at least one pass shall be on the inside and at least one pass shall be on the outside. All weld tests shall be performed after forming and welding.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:34 2005

5.1.3.9 Double Seam Gas Metal-Arc Welded Pipe

Double seam gas metal-arc welded pipe is defined as pipe that has two longitudinal seams produced by the gas metal-arc welding process defined in 5.1.2.2.2. The seams shall be approximately 180° apart. For each seam, at least one pass shall be on the inside and at least one pass shall be on the outside. All weld tests shall be performed after forming and welding.

5.1.3.10 Double Seam Combination Gas Metal-Arc and Submerged-Arc Welded Pipe

Double seam combination gas metal-arc and submerged-arc welded pipe is defined as pipe that has two longitudinal seams produced by a combination of the welding processes defined in 5.1.2.2.1 and 5.1.2.2.2. The seams shall be approximately 180° apart. For each seam, the gas metal-arc welding shall be continuous and first, and followed by the automatic submerged-arc welding process with at least one pass on the inside and at least one pass on the outside. All weld tests shall be performed after forming and welding.

5.1.3.11 Helical Seam Submerged-Arc Welded Pipe

Helical seam submerged-arc welded pipe is defined as pipe that has one helical seam produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. At least one pass shall be on the inside and at least one pass shall be on the outside. (This type of pipe is also known as spiral weld pipe.)

5.1.4 Types of Seam Welds

5.1.4.1 Electric Weld

An electric weld is a longitudinal seam weld produced by the electric welding process defined in 5.1.2.1.2.

5.1.4.2 Laser Weld

A laser weld is a longitudinal seam weld produced by the laser welding process defined in 5.1.2.1.3.

5.1.4.3 Submerged-Arc Weld

A submerged-arc weld is a longitudinal or helical seam weld produced by the submerged-arc welding process defined in 5.1.2.2.1.

5.1.4.4 Gas Metal-Arc Weld

A gas metal-arc weld is a longitudinal seam weld produced in whole or in part by the continuous gas metal-arc welding process defined in 5.1.2.2.2.

5.1.4.5 Skelp End Weld

A skelp end weld is a seam weld that joins plate or skelp ends together in helical seam pipe.

5.1.4.6 Jointer Weld

A jointer weld is a circumferential seam weld that joins two pieces of pipe together.

5.1.4.7 Tack Weld

A tack weld is a seam weld used to align the abutting edges until the final seam welds are produced. Tack welds shall be made by the following: (a) manual or semi-automatic submerged-arc welding, (b) electric welding, (c) gas metal-arc welding, (d) flux cored arc welding, or (e) shielded metal-arc welding using low hydrogen electrodes. Tack welds shall be removed by machining or remelting during subsequent welding of the seam.

5.2 COLD EXPANSION

Pipe furnished to this specification, except continuous welded, shall be either nonexpanded or cold expanded at the option of the manufacturer, unless otherwise specified on the purchase order. Suitable provision shall be incorporated to protect the weld from contact with the internal expander during mechanical expansion.

5.3 MATERIAL

5.3.1 Plate and Skelp for Helical Seam Pipe

The width of plate or skelp used to manufacture helical seam pipe shall not be less than 0.8 or more than 3.0 times the outside diameter of the pipe.

5.3.2 Repairs by Welding of Plate or Skelp (PSL 2 Only)

The plate or skelp used for PSL 2 pipe shall not contain any repair welds.

5.4 HEAT TREATMENT

The heat treating process shall be performed in accordance with a documented procedure. Pipe furnished to this specification may be as-rolled, normalized, normalized and tempered, subcritically stress relieved, or subcritically age hardened; and X Grades may be quenched and tempered. Grade B pipe that is quenched and tempered shall be seamless, meet the requirements of Supplementary Requirement 4 (SR4 of Appendix F), and be by agreement between purchaser and manufacturer. See Section 10 for applicable marking requirements.

5.5 SKELP END WELDS IN HELICAL SEAM PIPE

Junctions of skelp end welds and helical seam welds in finished pipe shall be permitted only at distances greater than 12 in. (305 mm) from the pipe ends. By agreement between the purchaser and the manufacturer, skelp end welds shall be permitted at the pipe ends, provided there is a circumferential

separation of at least 6 in. (152 mm) between the skelp end weld and the helical seam weld at the applicable pipe ends. Skelp end welds in finished pipe shall be properly prepared for welding and shall be made by automatic submerged-arc welding, automatic gas metal-arc welding, or a combination of both processes.

5.6 TRACEABILITY

5.6.1 PSL 1 Traceability Requirements

The manufacturer shall establish and follow procedures for maintaining heat and/or lot identity until all required heat and/or lot tests are performed and conformance with specification requirements is shown.

5.6.2 PSL 2 Traceability Requirements

The manufacturer shall comply with SR 15.2.

6 Material Requirements

6.1 CHEMICAL PROPERTIES

6.1.1 Chemical Composition

The composition of steel used for the manufacture of pipe furnished to this specification shall conform to the chemical requirements given in Table 2A (for PSL 1) or Table 2B (for PSL 2). The composition of intermediate grades (higher than X42) shall conform to the chemical requirements of the next higher standard grade. For Grades X42 and higher, by agreement between the purchaser and the manufacturer, elements other those listed in Tables 2A and 2B (which include columbium [niobium], vanadium, and titanium via the notes to the tables) may be used; however, care should be exercised in determining the alloying content for any given size and wall thickness of pipe, because the addition of such otherwise desirable elements may affect the weldability of the pipe.

6.1.2 Elements Analyzed

As a minimum, each required analysis shall include the following elements:

a. Carbon, manganese, phosphorus, sulfur, chromium, columbium [niobium], copper, molybdenum, nickel, silicon, titanium, and vanadium.

b. Boron. (But if the heat analysis indicates a boron content less than 0.001%, then no boron determination is required for the product analysis.)

c. Any other alloying element added during steelmaking for a purpose other than deoxidation.

6.1.3 Carbon Equivalent (PSL 2 only)

6.1.3.1 Calculation of Carbon Equivalent

For PSL 2 pipe, carbon equivalent (*CE*) calculations shall be based on the product analyses and shall be calculated as follows. All carbon equivalent results shall be reported:

a. When the carbon content is less than or equal to 0.12%, the carbon equivalent shall be calculated using the following formula for *CE(Pcm)* [see Note 1]:

$$CE(Pcm) = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

If the heat analysis indicates a boron content less than 0.001%, then the product analysis need not include boron, and the boron content can be considered as zero for the *CE(Pcm)* calculation.

b. When the carbon content is greater than 0.12%, the carbon equivalent shall be calculated using the following formula for *CE(IIW)* [see Note 2]:

$$CE(IIW) = C + \frac{Mn}{6} + \frac{(Cr + Mo + V)}{5} + \frac{(Ni + Cu)}{15}$$

6.1.3.2 Maximum Carbon Equivalent

The carbon equivalent shall not exceed the following:

a. For Grade X80 pipe, for all grades of seamless pipe having a specified wall thickness greater than 0.800 in. (20.3 mm), and for pipe designated by the purchaser as high carbon equivalent pipe, the value agreed upon between the purchaser and the manufacturer.

b. For pipe not covered in Item a above, a *CE(Pcm)* of 0.25% or a *CE(IIW)* of 0.43%, whichever is applicable.

Note 1: The *CE(Pcm)* formula for low carbon steel is commonly called the Ito-Bessyo formula. *CE(Pcm)* is in fact the chemical portion of the full formula. Reference: Y. Ito & K. Bessyo, "Weldability Formula of High Strength Steels Related to Heat Affected Zone Cracking, *Journal of Japanese Welding Society*, 1968, 37, (9), 938.

Note 2: The *CE(IIW)* formula is commonly called the *IIW* [International Institute of Welding] formula. Reference: Technical Report, 1967, IIW doc. IX-535-67.

6.2 MECHANICAL PROPERTIES

6.2.1 Tensile Properties

PSL 1 Grades A25, A, B, X42, X46, X52, X56, X60, X65, and X70 shall conform to the tensile requirements specified in Table 3A.

PSL 2 Grades B, X42, X46, X52, X56, X60, X65, X70, and X80 shall conform to the tensile requirements specified in Table 3B.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:35 2005

Other grades intermediate to the listed grades between X42 and X80 shall conform to tensile requirements agreed upon between the purchaser and the manufacturer, and the requirements shall be consistent with those specified in Table 3A (for PSL 1 pipe) or Table 3B (for PSL2 pipe).

For cold expanded pipe, the ratio of body yield strength and body ultimate tensile strength of each test pipe on which body yield strength and body ultimate tensile strength are determined, shall not exceed 0.93. The yield strength shall be the tensile stress required to produce a total elongation of 0.5% of the gage length as determined by an extensometer. When elongation is recorded or reported, the record or report shall show the nominal width of the test specimen when strip specimens are used and the diameter and gage length when round bar specimens are used, or shall state when full section specimens are used. For Grade A25 pipe, the manufacturer may certify that the material furnished has been tested and meets the mechanical requirements of Grade A25.

6.2.2 Flattening Test Acceptance Criteria

Acceptance criteria for flattening tests shall be as follows:

a. For electric welded pipe in grades higher than A25, and laser welded pipe smaller than $12^3/_4$.

1. For all pipe diameter-to-thickness ratios (D/t), flatten to two-thirds of the original OD without weld opening.
2. For pipe with a D/t greater than 10, continue flattening to one-third of the original OD without cracks or breaks other than in the weld.
3. For all pipe D/t, continue flattening until opposite walls of the pipe meet; no evidence of lamination or burnt metal shall develop during the entire test.

b. For grade A25 welded pipe, flatten to three-fourths of the original OD without weld fracture. Continue flattening to 60% of the original OD without cracks or breaks other than in the weld.

For the purpose of mechanical testing of the weld of electric welded pipe of size $2^3/_8$ or larger, the weld extends to a distance of $^1/_2$ in. (12.7 mm) on each side of the fusion line. For pipe smaller than size $2^3/_8$, the weld extends to a distance of $^1/_4$ in. (6.35 mm) on each side of the fusion line.

6.2.3 Bend Tests

Welded Grade A25 pipe of size $2^3/_8$ and smaller shall be tested according to 9.3.3. No cracks shall occur in any portion of the pipe, and no opening shall occur in the weld.

Note: For pipe smaller than size $2^3/_8$, the weld extends to a distance of $^1/_4$ in. (6.35 mm) on each side of the fusion line.

6.2.4 Manipulation Tests for Submerged-Arc, Gas Metal-Arc, and Laser Welds

Submerged-arc and gas metal-arc welds in pipe of all sizes, and laser welds in pipe of sizes $12^3/_4$ and larger, shall be tested by the guided-bend test (see 9.3.4).

6.2.5 Weld Ductility Test

For electric welded pipe in sizes $2^3/_8$ and larger, and for laser welded pipe smaller than size $12^3/_4$, the weld ductility shall be determined by tests on full-section specimens of 2 in. (50.8 mm) minimum length. The specimens shall be flattened cold between parallel plates. The weld shall be placed 90% from the direction of applied force (point of maximum bending). No crack or breaks exceeding $^1/_8$ in. (3.18 mm) in any direction in the weld or the parent metal shall occur on the outside surface until the distance between the plate is less than the value of S calculated by the following equations:

a. Grades less than X52:

$$S = \frac{3.07t}{0.07 + 3d/D}$$

b. Grades X52 or higher:

$$S = \frac{3.05t}{0.05 + 3t/D}$$

where

S = distance between flattening plates, in. (mm),

t = specified wall thickness of the pipe, in. (mm),

D = specified outside diameter of the pipe, in. (mm).

Cracks that originate at the edge of the specimen and are less than 0.25 in. (6.35 mm) long shall not be cause for rejection. One test shall be made on a length of pipe from each lot size as follows:

Grade	Size of Pipe	Lot Size, No. of Lengths
A25, A, and B	$2^3/_8$ through $5^9/_{16}$	400 or less
A25, A, and B	over $5^9/_{16}$ through $12^3/_4$	200 or less
X42 and higher	$2^3/_8$ through $12^3/_4$	200 or less
All grades	over $12^3/_4$	100 or less

For multiple-length pipe, a length shall be considered as each section cut from a particular multiple length. The weld ductility test may also serve as one of the flattening tests of 9.3.2 by compliance with appropriate amounts of flattening.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:35 2005

Note: For the purpose of mechanical testing of the weld of electric welded pipe of size $2^3/_8$ or larger, the weld extends to a distance of $^1/_2$ in. (12.7 mm) on each side of the fusion line.

6.2.6 Fracture Toughness Tests

6.2.6.1 Charpy Impact Tests for PSL 1

For PSL 1 pipe, Charpy impact testing is not required.

6.2.6.2 Charpy Impact Tests for PSL 2

For pipe sizes and specified wall thicknesses as given in Table 14 (pipe in size and drop-weight test and wall thickness combinations not covered by this table are not required to be tested), the manufacturer shall conduct Charpy V-notch tests that meet the following requirements. (Refer to 9.8.4 for guidance pertaining to subsize specimens.)

a. The test temperature shall be +32°F (0°C); however, pipe tested at a lower temperature is also acceptable if it meets all other applicable fracture toughness requirements below.

b. For all grades, the required minimum average (set of three specimens) absorbed energy for each heat based on full size specimens shall be 20 ft-lb (27 J) for transverse specimens or 30 ft-lb (41 J) for longitudinal specimens, whichever is applicable per Table 14.

c. For X80 only, the required minimum all-heat average absorbed energy for the entire order item, based on full size Charpy specimens shall be 50 ft-lb (68 J) for transverse specimens; or 75 ft-lb (101 J) for longitudinal specimens, whichever is applicable per Table 14. If the all-heat average of the order does not meet the applicable requirement, the manufacturer shall be responsible for the replacement of heats to bring the average up to the required level.

d. For X80 only, the required minimum shear area shall be either 40% for each heat and 70% for the all-heat average of the order based on the Charpy test, or 40% for each heat and 60% for the all-heat average based on the drop-weight tear test. The drop-weight tear test option only applies for welded pipe in sizes 20 or larger. If the all-heat average of the order does not meet the required percentage of shear area, the manufacturer shall be responsible for the replacement of heats as necessary to bring the average up to the required level.

6.2.6.3 Supplementary Fracture Toughness Tests

In addition to the requirements in 6.2.6.1 and 6.2.6.2, when so specified on the purchase order, the manufacturer shall conduct fracture toughness tests in accordance with Supplementary Requirement 5 and/or 6 (see SR5 and SR6 of Appendix F) or any combination of these, and shall furnish a report of results showing compliance with the supplementary requirements specified. The purchaser shall specify on the purchase order the testing temperature for SR5 and SR6 and the Charpy V-notch absorbed energy for SR5B.

6.2.7 Metallographic Examination

For PSL 1 electric welded pipe in grades higher than X42, for PSL 2 electric welded pipe in all grades, and for laser welded pipe in all grades, full body normalized pipe excluded, compliance with the requirement in 5.1.3.3 and 5.1.3.4 to heat treat the entire heat affected zone shall be demonstrated by metallographic examination of a weld cross section. Such examinations shall be performed at least once per operating shift (12 hours maximum) and whenever changes of grade, diameter, or wall thickness are made and whenever significant excursions from operating heat treatment conditions are encountered.

7 Dimensions, Weights, Lengths, Defects, and End Finishes

7.1 SPECIFIED DIMENSIONS

Line pipe shall be furnished in the outside diameters and wall thicknesses specified on the purchase order; such dimensions shall be in accordance with one of the following:

a. As given in Table 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable.

b. By agreement between the purchaser and the manufacturer, intermediate to the values given in Table 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable.

7.2 DIAMETER

The outside diameter shall be within the tolerances specified in Tables 7 and 8. For threaded pipe, the outside diameter at the threaded ends shall be such that the thread length, L_4, and the number of full-crest threads in that length are within the applicable dimensions and tolerances specified in API Standard 5B.

Pipe of sizes 20 and smaller shall permit the passage over the ends, for a distance of 4 in. (101.6 mm), of a ring gage that has a bore diameter not larger than the pipe's specified outside diameter plus the applicable plus tolerance shown in Table 8. For submerged-arc welded pipe, ring gages may be slotted or notched to permit passage of the gage over the weld reinforcement. Ring gage measurements shall be made at least once per 4 hours per operating shift.

Diameter measurements of pipe larger than size 20 shall be made with a diameter tape. Diameter measurements of pipe sizes 20 and smaller shall be made with a snap gage, caliper, or other device that measures actual diameter across a single plane, except that the manufacturer shall have the option of using a diameter tape. Diameter measurements shall be made at least once per 4 hours per operating shift.

Any pipe found to be out of tolerance is cause for individual diameter measurement of all pipe back to the last, and up to the next, two sequential pipes measured and found to be within tolerance.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:35 2005

By agreement between the purchaser and the manufacturer, the tolerances on the outside diameter at the pipe ends may be applied instead to the inside diameter at the pipe ends.

7.3 WALL THICKNESS

Each length of pipe shall be measured for conformance to the specified wall thickness requirements. The wall thickness at any location shall be within the tolerances specified in Table 9, except that the weld area shall not be limited by the plus tolerance. Wall thickness measurements shall be made with a mechanical caliper or with a properly calibrated nondestructive inspection device of appropriate accuracy. In case of dispute, the measurement determined by use of the mechanical caliper shall govern. The mechanical caliper shall be fitted with contact pins having circular cross sections of $^1/_4$ in. (6.35 mm) diameter. The end of the pin contacting the inside surface of the pipe shall be rounded to a maximum radius of $1^1/_2$ in. (38.10 mm) for pipe of size $6^5/_8$ or larger, and to a maximum radius of d/4 for pipe smaller than size $6^5/_8$, with a minimum radius of $^1/_8$ in. (3.2 mm). The end of the pin contacting the outside surface of the pipe shall be either flat or rounded to a radius of not less than $1^1/_2$ in. (38.10 mm).

7.4 WEIGHT

Each length of pipe of size $5^9/_{16}$ or larger shall be weighed separately; lengths of pipe smaller than size $5^9/_{16}$ shall be weighed either individually or in convenient groups, at the option of the manufacturer. For all sizes of pipe, the order item weights and, where applicable, the carload weights shall be determined. Threaded-and-coupled pipe shall be weighed with the couplings screwed on but without thread protectors, except for carload determinations for which proper allowance shall be made for the weight of the thread protectors. Threaded-and-coupled pipe may be weighed before the couplings are attached, provided that allowance is made for the weight of the couplings.

For plain-end pipe, the weights determined as described above shall conform to the calculated weights, within the tolerances specified in Table 10. For threaded-and-coupled pipe, the weights determined as described above shall conform to the calculated weights or adjusted calculated weights, within the tolerances specified in Table 10.

Full-length calculated weights shall be determined in accordance with the following equation:

$$W_L = (w_{pe} \times L) + e_w$$

where

W_L = calculated weight of a piece of pipe of length L, lb (kg),

w_{pe} = plain-end weight per unit length rounded to the nearest 0.01 lb/ft (0.01 kg/m),

L = length of pipe, including end finish, as defined in 7.5, ft (m),

e_w = weight gain or loss due to end finish, lb (kg). For plain-end pipe, e_w equals 0.

The plain-end weight per unit length, w_{pe}, shall be calculated using the following equation and rounded to the nearest 0.01 lb/ft (0.01 kg/m):

U.S. Customary unit equation (lb/ft) = $w_{pe} = 10.69\ (D\text{-}t)t$

SI unit equation (kg/m) = $w_{pe} = 0.024\ 66(D\text{-}t)t$

where

D = specified outside diameter, in. (mm),

t = specified wall thickness, in. (mm).

7.5 LENGTH

Unless otherwise agreed between the purchaser and the manufacturer, pipe shall be furnished in the nominal lengths and within the length tolerances shown in Table 11, as specified on the purchase order. For threaded-and-coupled pipe, the length shall be measured to the outer face of the coupling. The length of threaded-and-coupled pipe may be determined before the couplings are attached, provided that proper allowance is made for the length of the couplings. Each length of pipe shall be measured, except that pipe made in lengths that are uniform within 0.1 ft (0.03 m) need not be individually measured, provided that the accuracy of the length is verified at least once per 4 hours per operating shift. Any pipe found to be out of tolerance is cause for individual measurement of all pipe back to the last, and up to the next, two sequential pipes measured and found to be within tolerance.

The accuracy of length measuring devices for lengths of pipe less than 100 ft (30 m) shall be ± 0.1 ft (0.03 m).

7.6 STRAIGHTNESS

Pipe smaller than size $4^1/_2$ in Grades A25, A, and B shall be reasonably straight. All other pipe shall be randomly checked for straightness; deviation from a straight line shall not exceed 0.2% of the length. Measurement may be made using a taut string or wire from end to end along the side of the pipe, measuring the greatest deviation.

7.7 JOINTERS

When specified on the purchase order, jointers (two lengths of pipe coupled together by the manufacturer or two lengths of pipe welded together by the manufacturer in accordance with the requirements of Appendix A) may be furnished; however, no length used in making a jointer shall be less than 5.0 ft (1.52 m).

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:35 2005

For helical seam submerged-arc welded pipe, the junctions of skelp end welds and helical seam welds shall be permitted only at distances greater than 12 in. (304.8 mm) from jointer welds. By agreement between the purchaser and the manufacturer, skelp end welds in finished pipe shall be permitted at jointer welds, provided that there is a circumferential separation of at least 6 in. (152.4 mm) between the junction of the skelp end weld and the jointer weld and the junction of the helical seam and the jointer weld.

Double joints are not within the purview of API Specification 5L. Double joints are defined as lengths of pipe welded together by parties other than the manufacturer or lengths welded together by the manufacturer in accordance with requirements other than those in Appendix A.

7.8 WORKMANSHIP AND DEFECTS

Imperfections of the types described in 7.8.1–7.8.14 that exceed the specified criteria shall be considered defects. The manufacturer shall take all reasonable precautions to minimize recurring imperfections, damage, and defects.

7.8.1 Dents

The pipe shall contain no dents greater than $^1/_4$ in. (6.35 mm), measured as the gap between the lowest point of the dent and a prolongation of the original contour of the pipe. The length of the dent in any direction shall not exceed one-half the diameter of the pipe. All cold-formed dents deeper than $^1/_8$ in. (3.18 mm) with a sharp bottom gouge shall be considered a defect. The gouge may be removed by grinding.

7.8.2 Offset of Plate Edges

For pipe with filler metal welds having specified wall thicknesses of 0.500 in. (12.7 mm) and less, the radial offset (misalignment) of plate edges in the weld seams shall not be greater than $^1/_{16}$ in. (1.59 mm). For pipe with filler metal welds having specified wall thicknesses over 0.500 in. (12.7 mm), the radial offset shall not be greater than 0.125 t or $^1/_8$ in. (3.18 mm), whichever is smaller. For electric welded pipe, the radial offset of plate edges plus flash trim shall be no greater than 0.060 in. (1.52 mm). For laser welded pipe, the radial offset of plate edges plus weld reinforcement trim shall be no greater than 0.060 in. (1.52 mm).

7.8.3 Out-of-Line Weld Bead for Pipe with Filler Metal Welds

Out-of-Line weld bead (off-seam weld) shall not be cause for rejection, provided that complete penetration and complete fusion have been achieved, as indicated by nondestructive inspection.

7.8.4 Height of Outside and Inside Weld Beads—Submerged-Arc Welds

The weld bead shall not extend above the prolongation of the original surface of the pipe by more than the following:

Specified Wall Thickness	Maximum Height of Weld Bead
$^1/_2$ in. (12.70 mm) and under	$^1/_8$ in. (3.18 mm)
Over $^1/_2$ in. (12.70 mm)	$^3/_{16}$ in. (4.76 mm)

Weld beads higher than permitted by the requirements of this paragraph may be ground to acceptable limits at the option of the manufacturer.

The height of the weld bead shall in no case come below a prolongation of the surface of the pipe (outside or inside the weld bead) except that contouring by grinding, otherwise covered in this specification, shall be permitted.

7.8.5 Height of Flash of Electric Welded Pipe

The outside flash of electric welded pipe shall be trimmed to an essentially flush condition.

The inside flash of electric welded pipe shall not extend above the prolongation of the original inside surface of the pipe more than 0.060 in. (1.52 mm).

7.8.6 Height of Weld Reinforcement of Laser Welded Pipe

The outside weld reinforcement of laser welded pipe shall be trimmed to an essentially flush condition. The inside weld reinforcement of laser welded pipe shall not extend above the prolongation of the original inside surface of the pipe more than 0.060 in. (1.52 mm). Laser welds may have underfills, which are acceptable within the limits of 7.8.13.

7.8.7 Trim of Inside Flash of Electric Welded Pipe and Trim of Inside Weld Reinforcement of Laser Welded Pipe

The depth of groove resulting from removal of the internal flash of electric welded pipe or removal of the internal weld reinforcement of laser welded pipe shall not be greater than that listed below for the various wall thicknesses. Depth of groove is defined as the difference between the wall thickness measured approximately 1 in. (25.4 mm) from the weld line and the remaining wall under the groove.

Specified Wall Thickness (t)	Maximum Depth of Trim
≤ 0.150 in. (3.8 mm)	0.10 t
> 0.150 in. (3.8 mm) and < 0.301 in. (7.6 mm)	0.015 in. (0.38 mm)
≥ 0.301 in. (7.6 mm) and greater	0.05 t

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:36 2005

7.8.8 Hard Spots

Any hard spot having a minimum dimension greater than 2 in. (50.8 mm) in any direction and a hardness greater than or equal to 35 HRC (327 HB) shall be rejected. The section of pipe containing the hard spot shall be removed as a cylinder.

The surface of cold-formed welded pipe shall be examined visually to detect irregularities in the curvature of the pipe. When this examination fails to disclose mechanical damage as the cause of the irregular surface but indicates that the irregular surface may be attributed to a hard spot, the hardness and dimensions of the area shall be determined. If hardness and dimensions exceed the aforementioned rejection criteria, the hard spot shall be removed.

7.8.9 Cracks, Sweats, and Leaks

All cracks, sweats, and leaks shall be considered defects.

7.8.10 Laminations (See Note)

Any lamination or inclusion extending into the face or bevel of the pipe and having a visually determined transverse dimension exceeding $^1/_4$ in. (6.35 mm) is considered a defect. Pipe containing such defects shall be cut back until no lamination or inclusion is greater than $^1/_4$ in. (6.35 mm).

Any lamination in the body of the pipe exceeding both of the following is considered a defect:

a. Greater than or equal to $^3/_4$ in. (19.0 mm) in the minor dimension.

b. Greater than or equal to 12 in.^{2} (7742 mm^2) in area.

Disposition of such defects shall be in accordance with 9.7.6, Item c or d. No specific inspection by the manufacturer is required unless the purchaser specifies special nondestructive inspection on the purchase order.

Note: A lamination is an internal metal separation creating layers generally parallel to the surface.

7.8.11 Arc Burns

Arc burns are localized points of surface melting caused by arcing between electrode or ground and pipe surface and shall be considered defects (see note).

Disposition of pipe containing arc burns shall be in accordance with 9.7.6, except that removal of defects by grinding shall be subject to the following additional condition. Arc burns may be removed by grinding, chipping, or machining. The resulting cavity shall be thoroughly cleaned and checked for complete removal of damaged material by etching with a 10% solution of ammonium persulfate or a 5% solution of nital.

Note: Contact marks, defined as intermittent marks adjacent to the weld line, resulting from the electrical contact between the electrodes supplying the welding current and the pipe surface, are not defects.

7.8.12 Undercuts

Undercutting of submerged-arc or gas metal-arc welded pipe is the reduction in thickness of the pipe wall adjacent to the weld where it is fused to the surface of the pipe. Undercutting can best be located and measured visually.

a. Minor undercutting on either the inside or the outside of the pipe is defined as follows and is acceptable without repair or grinding:

1. Maximum depth of $^1/_{32}$ in. (0.79 mm) and not exceeding $12^1/_2\%$ of the specified wall thickness with a maximum length of one-half the specified wall thickness and not more than two such undercuts in any 1 ft (0.30 m) of the weld length.

2. Maximum depth of $^1/_{64}$ in. (0.40 mm) any length.

b. Undercutting not classified as minor shall be considered a defect. Disposition shall be as follows:

1. Undercut defects not exceeding $^1/_{32}$ in. (0.79 mm) in depth and not exceeding $12^1/_2\%$ of the specified wall thickness shall be removed by grinding in accordance with 9.7.6, Item a.

2. Disposition of undercuts greater in depth than $^1/_{32}$ in. (0.79 mm) or $12^1/_2\%$ of the specified wall thickness shall be in accordance with 9.7.6, Item b, c, or d.

7.8.13 Underfills

Underfill of laser welded pipe is a depression on the weld face or root surface extending below the adjacent surface of the base metal. Underfills can best be located visually.

a. Underfills on the inside of the pipe shall be considered a defect.

b. Minor underfills on the outside of the pipe are defined as follows and are acceptable without repair or grinding.

1. Maximum depth not exceeding 5% of the specified wall thickness with a maximum length of two times the specified wall thickness, with a remaining wall thickness of $87^1/_2\%$ of the specified wall thickness, and not more than two such underfills in any 1 ft (0.30 m) of weld length. Furthermore, the coincident combination of underfills, other imperfections, grinds, and weld trim on the outside and inside surfaces of laser welded pipe shall not reduce the remaining wall thickness to less than that permitted in Table 9.

2. Maximum depth of $^1/_{64}$ in. (0.40 mm), any length.

c. Disposition of external underfills that are not classified as minor shall be in accordance with 9.7.6 except that the length of grind to remove underfills shall not exceed 6 in. (152.4 mm) in any 1 ft (0.30 m) of weld length or 12 in. (0.30 m) in any 5 ft (1.52 m) of weld length. Disposition of internal underfills shall be in accordance with 9.7.6, Items b, c, or d.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:36 2005

7.8.14 Other Defects

Any imperfection having a depth greater than $12^1/_2$% of the specified wall thickness, measured from the surface of the pipe, shall be considered a defect.

7.9 PIPE ENDS

7.9.1 General

The pipe ends shall be plain, threaded, belled, or prepared for special couplings, as specified on the purchase order. Helical seam pipe shall not be threaded. The inside and outside edges of the ends of all pipe shall be free of burrs.

7.9.2 Threaded Ends (PSL 1 only)

Threaded ends shall conform to the threading, thread inspection, and gaging requirements specified in API Standard 5B. One end of each length of threaded pipe shall be provided with a coupling conforming to the requirements of Section 8, in effect at the date of manufacture of each coupling (see Note 1), and the other end with thread protection conforming to the requirements of 11.2. Couplings shall be screwed onto the pipe handling-tight (see Note 2), except that they shall be applied power-tight if so specified on the purchase order. A thread compound shall be applied to cover the full surface of either the coupling or pipe engaged thread before making up the joint. All exposed threads shall be coated with this thread compound. Unless otherwise specified on the purchase order, the manufacturer may use any thread compound that meets the performance objectives set forth in API RP 5A3. A storage compound of distinct color may be substituted for this thread compound on all exposed threads. Whichever compound is used shall be applied to a surface that is clean and reasonably free of moisture and cutting fluids.

Notes:

1. Unless otherwise specified on the purchase order, it is not mandatory that both the pipe and coupling of each threaded and coupled product be manufactured to the same edition of this specification.
2. Handling-tight shall be defined as sufficiently tight that the coupling cannot be removed except by using a wrench. The purpose of making up couplings handling-tight is to facilitate removal of the couplings for cleaning and inspecting threads and applying fresh thread compound before laying the pipe. This procedure has been found necessary to prevent thread leakage, especially in gas lines, because manufacturer-applied couplings made up power-tight, although leak-proof at the time of makeup, may not always remain so after transportation, handling, and laying.

7.9.3 Plain Ends

Unless otherwise specified on the purchase order, plain-end pipe shall be furnished with ends beveled to an angle of 30 degrees (+ 5 degrees, – 0 degrees) measured from a line drawn perpendicular to the axis of the pipe, and with a root face of $^1/_{16}$ in. ± $^1/_{32}$ in. (1.59 ± 0.79 mm) (see note). For seamless pipe where internal machining is required to maintain the root face tolerance, the angle of the internal taper, measured from the longitudinal axis, shall be no larger than the following:

Specified Wall Thickness, in. (mm)	Maximum Angle of Taper (degrees)
Less than 0.418 (10.6)	7
0.418 through 0.555 (10.6 through 14.1)	$9^1/_2$
0.556 through 0.666 (Greater than 14.1 through 16.9)	11
Over 0.666 (16.9)	14

For the removal of an internal burr on welded pipe larger than size $4^1/_2$, the internal taper, measured from the longitudinal axis, shall be no larger than 7°.

For pipe sizes $2^3/_8$ and larger, the pipe ends shall be cut square within $^1/_{16}$ in. (1.59 mm). Pipe ends from each end-finishing machine shall be checked for compliance at least once per 4 hours per operating shift.

Both ends of pipe with filler metal welds shall have the inside reinforcement removed for a distance of approximately 4 in. (101.6 mm) from the end of the pipe.

Note: The purchaser is directed to the applicable code for the recommended angle of pipe bevel.

7.9.4 Belled Ends (PSL 1 only)

When so specified on the purchase order, pipe with specified wall thickness 0.141 in. (3.6 mm) and less shall be furnished with one end belled for bell and spigot joints in accordance with Figure 1. The belled end shall be visually inspected for workmanship and defects.

7.9.5 Ends Prepared for Special Couplings (PSL 1 only)

When so specified on the purchase order, pipe shall be furnished with ends suitable for use with special couplings such as Dresser, Victaulic, or other equivalent special couplings. Such pipe shall be sufficiently free from indentations, projections, or roll marks for a distance of 8 in. (203 mm) from the end of the pipe to permit proper makeup of coupling.

8 Couplings (PSL 1 only)

8.1 MATERIAL

Couplings for Grades A and B pipe shall be seamless and shall be made of a grade of material at least equal in mechanical properties to that of the pipe. Couplings for Grade A25

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:36 2005

pipe shall be seamless or welded and shall be made of steel. By agreement between the purchaser and the manufacturer, welded couplings may be supplied on pipe of sizes 14 and larger, if the couplings are properly marked.

8.2 TENSILE TESTS

A tensile test shall be made on each heat of steel from which couplings are produced, and the coupling manufacturer shall maintain a record of such tests. This record shall be open to inspection by the purchaser. If such a test is made on finished couplings, either round specimens proportioned as specified in ASTM E 8, *Test Methods for Tension Testing of Metallic Materials*, or strip specimens shall be used at the option of the manufacturer.

8.3 DIMENSIONS

Couplings shall conform to the dimensions and tolerances shown in Table 12 (see note) and Figure 2.

Note: Couplings given in Table 12 are suitable for pipe having dimensions as given in Tables 4 and 5.

8.4 INSPECTION

Couplings shall be free from blisters, pits, cinder marks, and other defects that would impair the efficiency of the coupling or break the continuity of the thread.

9 Inspection and Testing

9.1 TEST EQUIPMENT

If test equipment, whose calibration or verification is required under the provisions of the specification, is subjected to unusual or severe conditions sufficient to make its accuracy questionable, recalibration or reverification shall be performed prior to further use of the equipment.

9.2 TESTING OF CHEMICAL COMPOSITION

9.2.1 Heat Analyses

The steel manufacturer shall determine the analysis of each heat of steel used in the manufacture of pipe specified on the purchase order. The analysis so determined shall conform to the requirements of 6.1.1.

For Grade X80, heat analysis limits have not been defined, only product analysis limits.

9.2.2 Product Analyses

9.2.2.1 Sampling Frequency

The manufacturer shall determine the analysis of two samples representing each heat of steel used for the production of pipe under this specification.

9.2.2.2 Sampling Methods

9.2.2.2.1 Seamless Pipe

At the option of the manufacturer, samples used for product analyses shall be taken either from tensile test specimens or from the finished pipe.

9.2.2.2.2 Welded Pipe

At the option of the manufacturer, samples used for product analyses shall be taken from either finished pipe, plate, skelp, tensile test specimens, or flattening test specimens. The location of the samples shall be a minimum of 90° from the weld of longitudinally welded pipe. For helical seam pipe, the sample location shall be at a position not less than one quarter of the distance between adjacent weld convolutions as measured from either edge of the weld. For pipe manufactured from plate or skelp, the product analyses may be made by the supplier of the plate or skelp providing the analyses are made in accordance with the frequency requirement of this specification.

9.2.3 Test Reports

9.2.3.1 When required by the purchaser, for Grade A25, the manufacturer shall certify that the pipe furnished was produced in conformance with the requirements for chemical properties and tests of API Specification 5L.

9.2.3.2 Chemical analyses required by this specification shall be reported to the purchaser when SR15 or PSL 2 is specified.

9.3 TESTING OF MECHANICAL PROPERTIES

9.3.1 Tensile Tests

9.3.1.1 Tensile Test Specimens

Tensile test orientation shall be as shown in Figure 3. At the option of the manufacturer for longitudinal seam welded pipe, the longitudinal specimens may be taken from the skelp parallel to the rolling direction and approximately midway between edge and center. At the option of the manufacturer, the specimen may be either full section, strip specimen, or round bar specimens as specified in 9.3.1.3, 9.3.1.4, and Figure 4. The type, size, and orientation of the specimens shall be reported. Testing of strip specimens shall be with suitable curved-face testing grips, or flat-face testing grips if the grip areas of the specimens have been machined to reduce the curvature or have been flattened without heating. For strip specimens, the specified width in the gage length shall be either $1^1/_2$ in. (38.1 mm) or $^3/_4$ in. (19.0 mm) for pipe of size $3^1/_2$ or smaller; either $1^1/_2$ in. (38.1 mm) or 1 in. (25.4 mm) for pipe of size larger than $3^1/_2$ up to size $6^5/_8$, inclusive; and $1^1/_2$ in. (38.1 mm) for pipe larger than size $6^5/_8$.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:37 2005

9.3.1.2 Tensile Testing Frequency

Tensile tests shall be made at the frequency of one test per inspection lot as shown in Table 13.

9.3.1.3 Longitudinal Tensile Tests

At the option of the manufacturer, longitudinal tests may utilize a full section specimen (see Figure 4, Subfigure B), a strip specimen (see Figure 4, Subfigure C), or for pipe with wall thickness greater than 0.750 in. (19.1 mm) a 0.500-in. (12.7-mm) diameter round bar specimen (see Figure 4, Subfigure D). The strip specimen shall be tested without flattening.

9.3.1.4 Transverse Tensile Tests

The transverse tensile properties shall be determined, at the option of the manufacturer, by one of the following methods:

a. The yield strength, ultimate tensile strength, and elongation values shall be determined on either a flattened rectangular specimen (see Figure 4, Subfigure E) or on a 0.500-in. (12.7-mm) or 0.350-in. (8.9-mm) round bar specimen (see Figure 4, Subfigure G).

The yield strength shall be determined by the ring expansion method (see Figure 4, Subfigure A) with the ultimate strength and elongation values determined from a flattened rectangular specimen.

The same method of testing shall be employed for all lots in an order item. All transverse tensile specimens shall be as shown in Figure 4. All specimens shall represent the full wall thickness of the pipe from which the specimen was cut, except for round bar tensile specimens.

Transverse round bar specimens are to be secured from nonflattened pipe sections. The 0.500-in. (12.7-mm) diameter round bar specimens shall be used when the pipe size allows, and the 0.350-in. (8.9-mm) diameter round bar specimen shall be used for other sizes. For pipe sizes too small to allow a 0.350-in. (8.9-mm) specimen, round bar tensile specimens are not permitted.

9.3.1.5 Weld Tensile Tests

Weld tensile test specimens shall be taken at 90° to the weld with the weld at the center as shown in Figures 3 and 4 and shall represent the full wall thickness of the pipe from which the specimen was cut. Weld reinforcement may be removed at the manufacturer's option. Weld tensile tests need not include determination of yield strength and elongation.

9.3.1.6 Control Tensile Tests

For pipe other than Grade A25, one tensile test per heat shall be made as a control, and a record of such tests shall be available to the purchaser. For longitudinal seam welded pipe, such tensile tests shall be made using samples taken from either plate, skelp, or finished pipe at the option of the manufacturer.

9.3.2 Flattening Tests

Flattening tests shall be performed for electric welded, continuous welded, and laser welded pipe. Frequency of testing, sample location, test orientation, and applicable pipe sizes shall be as shown in Figure 5. For electric welded pipe that is to be processed through a hot stretch mill, the flattening test specimens shall be obtained either prior to or after such treatment, at the option of the manufacturer.

9.3.3 Bend Tests

One full section specimen of appropriate length, cut from a length of pipe from each lot of 25 tons (22.7 Mg), or fraction thereof, for pipe of nominal size 1.900 and smaller, and from each lot of 50 tons (45.5 Mg), or fraction thereof, for pipe of size $2^3/_8$ shall be bent cold through 90°, around a mandrel having a diameter not greater than twelve times the outside diameter of the pipe being tested, with the weld located approximately 45° from the point of contact of the specimen with the mandrel.

9.3.4 Guided-Bend Tests

The test specimens shall be taken from the helical or each longitudinal seam weld in a length of pipe from each lot of 50 lengths or less of each combination of specified outside diameter, specified wall thickness, and grade; and from a skelp end weld in a length of pipe from each lot of 50 lengths or less of each combination of specified outside diameter, specified wall thickness, and grade of finished helical seam pipe containing skelp end welds. The test specimens shall not contain repair welds.

9.3.5 Fracture Toughness Tests

9.3.5.1 Charpy Test Specimens

The Charpy test specimens shall be prepared in accordance with ASTM A 370, *Methods and Definitions for Mechanical Testing of Steel Products*. The specimen size and orientation shall be as given in Table 14, except that it shall be permissible to use $^2/_3$ or $^1/_2$ size test specimens as required when the absorbed energy is expected to exceed 80% of the full scale capacity of the testing machine. The Charpy specimens shall be taken from the body of the pipe. For welded pipe, the location shall be 90° from the weld seam. Notch orientation shall be through the wall thickness as shown in Figure F-3 of Appendix F.

9.3.5.2 Charpy Testing Frequency

The minimum test frequency shall be one test per heat per combination of pipe size and specified wall thickness. An impact test shall consist of three specimens; the reported results shall be the three individual specimen values and the average of the three specimens.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:37 2005

9.3.5.3 Drop-Weight Tear Test Specimen and Test Frequency

When the drop-weight tear test option is selected (see 6.2.6.3), refer to SR6.

9.4 HYDROSTATIC TESTS

9.4.1 Hydrostatic Test Requirements

Each length of pipe shall withstand, without leakage, an inspection hydrostatic test to at least the pressure specified in 9.4.3. Test pressures for all sizes of seamless pipe and for welded pipe in sizes 18 and smaller, shall be held for not less than 5 seconds. Test pressures for welded pipe in sizes 20 and larger shall be held for not less than 10 seconds. For threaded-and-coupled pipe, the test shall be applied with the couplings made up power-tight if power-tight makeup is specified on the purchase order, except that pipe sizes larger than $12^3/_4$ may be tested in the plain-end condition. For threaded pipe furnished with couplings made up handling-tight, the hydrostatic test shall be made on the pipe in the plain-end or threads-only condition or with couplings applied, unless otherwise agreed by the purchaser and the manufacturer.

9.4.2 Verification of Hydrostatic Test

In order to ensure that every length of pipe is tested to the required test pressure, each tester (except those on which continuous welded pipe is tested) shall be equipped with a recording gage that will record the test pressure and duration of time the pressure is applied to each length of pipe, or shall be equipped with some positive and automatic or interlocking device to prevent pipe from being classified as tested until the test requirements (pressure and time) have been complied with. Such records or charts shall be available for examination at the manufacturer's facility by the purchaser's inspectors. The test pressure measuring device shall be calibrated by means of a dead weight tester, or equivalent, within the 4 months prior to each use. Retention of calibration records shall be as specified in 12.2.

9.4.3 Test Pressures

The minimum test pressure shall be the standard test pressure given in Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C; the alternative test pressure given in Tables 6A, 6B, 6C, E-6A, E-6B, or E-6C if so specified in the purchase order; a pressure higher than standard, at the discretion of the manufacturer unless specifically limited by the purchaser; or a pressure higher than standard, as agreed between the purchaser and the manufacturer (see Note 1). The minimum test pressures for grades, outside diameters, and specified wall thicknesses not listed shall be computed by the equation given in Note 2 below. For all sizes of Grade A25 pipe smaller than $5^9/_{16}$ and all sizes of Grade A and B pipe smaller than $2^3/_8$, the test pressure has been arbitrarily assigned. Where the unlisted wall thickness is intermediate to wall thicknesses whose test pressures have been arbitrarily assigned, the test pressure for the intermediate wall thickness shall be equal to the test pressure specified for the next heavier wall thickness. When computed pressures are not an exact multiple of 10 psi (100 kPa), they shall be rounded to the nearest 10 psi (100 kPa).

When the purchase order specifies a hydrostatic test pressure that will produce a hoop stress greater than 90% of the specified minimum yield strength, by agreement between the purchaser and the manufacturer, the hydrostatic test pressure shall be determined in accordance with Appendix K.

Note 1: The hydrostatic test pressures given herein are inspection test pressures, are not intended as a basis for design, and do not necessarily have any direct relationship to working pressures.

Note 2: The test pressures given in Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, and E-6C were computed by the following equations (see Footnotes a through d) and rounded to the nearest 10 psi (100 kPa):

U.S. Customary Unit Equation

$$P = \frac{2St}{D}$$

SI Unit Equation

$$P = \frac{2000St}{D}$$

where

P = hydrostatic test pressure in psi (kPa),

S = fiber stress in psi (MPa), equal to a percentage of the specified minimum yield strength for the various sizes as shown in the tabulation below,

t = specified wall thickness, in. (mm),

D = specified outside diameter, in. (mm).

Grade	Size	Percent of Specified Minimum Yield Strength: Standard Test Pressure	Percent of Specified Minimum Yield Strength: Alternative Test Pressure
A25	$5^9/_{16}$[a]	60	—
A	$\geq 2^3/_8$[b]	60	75
B	$\geq 2^3/_8$[b]	60	75
X42 through X80	$\leq 5^9/_{16}$	60[c]	75[d]
	$> 5^9/_{16}$ and $\leq 8^5/_8$	75[c]	75[d]
	$> 8^5/_8$ and < 20	85[c]	85[d]
	≥ 20	90[c]	90[d]

[a]Test pressures were limited to 2,800 psi (19 300 kPa). Test pressures for other sizes were established arbitrarily.

[b]Test pressures were limited to 2,500 psi (17 200 kPa) for $3^1/_2$ and smaller, and to 2,800 psi (19 300 kPa) for sizes larger than $3^1/_2$. Test pressures for other sizes were established arbitrarily.

[c]Test pressures for Grades X42 through X80 were limited to 3,000 psi (20 700 kPa) to accommodate hydrostatic tester limitations.

[d]Test pressures for Grades X42 through X80 were limited to 7,260 psi (50 000 kPa) for sizes < 16 and 3,630 psi (25 000 kPa) for sizes ≥ 16.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:37 2005

9.4.4 Supplementary Hydrostatic Tests

By agreement between the purchaser and the manufacturer, for Grade X42 and higher, the manufacturer shall make additional internal pressure tests, which may involve one or more of the following methods. In all supplementary hydrostatic tests, the formula shown in 9.4.3 shall be used for stress calculations. The conditions of testing shall be as agreed upon.

a. Hydrostatic destructive tests in which the minimum length of the specimen is ten times the outside diameter of the pipe, but need not exceed 40 ft (12.2 m).

b. Full-length destructive tests made by the hydrostatic pressure water column method.

c. Hydrostatic transverse yield strength tests using accurate strain gages (see note).

Note: Acceptable gages are the roller-chain ring-expansion gage, the metallic bonded resistance strain gage, or other suitable gages of similar accuracy.

9.5 DIMENSIONAL TESTING

The accuracy of all measuring instruments used for acceptance or rejection, except ring and plug thread gages and weighing devices, shall be verified at least once per operating shift (12 hours maximum).

Verifying the accuracy of measuring devices such as snap gages and drift mandrels shall consist of inspection for wear and conformance to specified dimensions. Verifying the accuracy of rules, length measuring tapes, and other nonadjustable measuring devices shall consist of a visual check for legibility of markings and general wear of fixed reference points. The adjustable and nonadjustable designation of measuring devices utilized by the manufacturer shall be documented.

The verification procedure for working ring and plug thread gages shall be documented. The accuracy of all weighing devices shall be verified at periods not to exceed those required by the manufacturer's documented procedure in accordance with National Institute of Standards and Technology (NIST) standards or equivalent regulations in the country of manufacture of products made to this specification.

If measuring equipment, whose calibration or verification is required under the provisions of the specification, is subjected to unusual or severe conditions sufficient to make its accuracy questionable, recalibration or reverification shall be performed before using the equipment.

9.6 VISUAL INSPECTION

All pipe shall be visually examined and shall be free of defects in the finished condition.

9.7 NONDESTRUCTIVE INSPECTION

9.7.1 Purchaser Inspection

When inspection by the purchaser is stated on the purchase order, the provisions of Appendix H shall apply.

9.7.2 Methods of Inspection

Except for Grade A25 pipe, the weld seams of welded pipe of sizes $2^3/_8$ and larger shall be inspected full length (100%) in accordance with the methods specified below. In addition, the skelp end weld in finished helical seam pipe shall be so inspected.

The location of equipment in the manufacturer's facility shall be at the discretion of the manufacturer, except that final inspection of weld seams of cold expanded pipe shall be performed after cold expansion.

9.7.2.1 Submerged-arc welds shall be inspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12. Such inspection shall be full length or for a minimum distance of 8 in. (203 mm) from each end if the balance of the weld length is inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4.

9.7.2.2 Electric welds shall be inspected by ultrasonic or electromagnetic methods in accordance with 9.7.4.1 through 9.7.4.4. If necessary to meet the full length (100%) inspection requirements of 9.7.2, pipe ends shall be inspected by using hand-held ultrasonic shear wave equipment or other NDT method agreed to by the manufacturer and the purchaser.

By agreement between the purchaser and the manufacturer and when specified on the purchase order, electric welds shall be nondestructively inspected in accordance with SR17 (see Appendix F).

9.7.2.3 Laser welds shall be inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4. If necessary to meet the full length (100%) inspection requirements of 9.7.2, pipe ends shall be inspected by using hand-held or automatic ultrasonic shear wave equipment, or other NDT method agreed to by the manufacturer and the purchaser.

By agreement between the purchaser and the manufacturer and when specified on the purchase order, laser welds shall be ultrasonically inspected in accordance with SR17 (see Appendix F).

9.7.2.4 Gas metal-arc welds shall be inspected full length by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4. In addition, the weld at each end of the pipe shall be inspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12 for a minimum distance of 8 in. (203 mm) from each end.

9.7.2.5 Skelp end welds in finished helical seam pipe shall have been inspected in accordance with one or more of the

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:38 2005

methods specified above for the weld type. Radiological inspection shall include the junction of the skelp end weld with the helical seam weld. For cold expanded pipe, radiological inspection shall be performed after expansion.

9.7.2.6 All PSL 2 seamless pipe and PSL 1 Grade B quenched and tempered seamless pipe (see 5.4) shall be nondestructively inspected in accordance with SR4 (see Appendix F). By agreement between the purchaser and the manufacturer and when specified on the purchase order, other PSL 1 seamless pipe shall be nondestructively inspected in accordance with SR4 (see Appendix F).

9.7.3 Radiological Inspection

9.7.3.1 Radiological Inspection Equipment

The homogeneity of weld seams examined by radiological methods shall be determined by means of X-rays directed through the weld material in order to create a suitable image on radiographic film or fluorescent screen or a television screen, provided adequate sensitivity can be obtained.

9.7.3.2 Fluoroscopic Operator Qualification

Operators of fluoroscopic equipment shall be trained, tested, and certified by the pipe manufacturer.

Details of such training, testing, and certification programs shall be available to the purchaser. This program shall include the following:

a. Classroom instruction in the fundamentals of radiological inspection techniques.

b. On-the-job training designed to familiarize the operator with specific installations, including the appearance and interpretation of weld imperfections and defects. The duration of such training shall be sufficient to ensure adequate assimilation of the knowledge required for conducting the inspection.

c. Knowledge of appropriate requirements of this specification.

d. A physical examination at least once per year to determine the operator's optical capability to perform the required inspection.

e. Upon completion of Items a and b above, an examination shall be given by the manufacturer to determine if the operator is qualified to properly perform fluoroscopic examinations.

9.7.3.3 Operation Certification

Certified operators whose work has not included fluoroscopic inspection for a period of one year or more shall be recertified by successfully completing the examination (Item e above) and also passing the physical examination (Item d above). Substantial changes in procedure or equipment shall require recertification of the operators.

9.7.3.4 NDT Reference Standards

Unless otherwise specified, the reference standard shall be the API standard penetrameter described in 9.7.3.5, or at the option of the manufacturer the ISO wire penetrameter described in 9.7.3.6. By agreement between the purchaser and the manufacturer, other standard penetrameters may be used.

9.7.3.5 API Standard Penetrameter

The API standard penetrameter shall be as shown in Figure 6 and made of a material with the same radiological characteristics as the pipe. The thickness of the penetrameter shall be a maximum of 4% of the specified wall thickness. Either 2% or 4% penetrameters may be used (see Tables 15 and 16 for sizes).

9.7.3.6 ISO Wire Penetrameter

The ISO wire penetrameter shall be Fe 1/7, Fe 6/12, or Fe 10/16 in accordance with Tables 17 and 18 for the appropriate wall thickness. When the wire penetrameter is placed across the weld, the diameter of the wire employed shall be based on the specified wall thickness plus the estimated thickness of the weld reinforcement (not to exceed the maximum allowed) at the penetrameter location. When the penetrameter is placed on the base metal, the diameter of the wire employed shall be based on the specified wall thickness..

9.7.3.7 Frequency of Calibration

When the fluoroscopic method is used full length and on each film when film is used, the penetrameter shall be used to check the sensitivity and adequacy of the radiographic technique on one pipe in every lot of 50 pipe, at least once per 4 hours per operating shift. When film is used full length, one penetrameter shall be used for each length of pipe. The pipe shall be held in a stationary position during the adjustment of the radiographic technique by use of the penetrameter. Proper definition and sensitivity is attained when all three holes of the API standard penetrameter or individual wires of the ISO penetrameter are clearly discernible.

9.7.3.8 Procedure for Evaluating In-Motion Operation of a Fluoroscope

To evaluate the definition of defects at operational speeds, a pipe section having a minimum wall thickness of 0.375 in. (9.5 mm) shall be used. Series of $^{1}/_{32}$ in. (0.79 mm) holes, as shown in Example 6 of Figure 7 shall be drilled into the center of the weld to a depth of 100% of the total thickness. At least four such series shall be used, spaced 1 foot apart. As an alternative to the use of the pipe section described above, a penetrameter as described in 9.7.3.4, 9.7.3.5, and 9.7.3.6 may be used at the option of the manufacturer. The speed of operation shall be adjusted so that the holes in the pipe section or

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:38 2005

API penetrameter, or individual wires in the ISO penetrameter, are clearly visible to the operator.

9.7.3.9 Acceptance Limits for Radiological Inspection

Radiological examination shall be capable of detecting weld imperfections and defects as described in 9.7.3.10 and 9.7.3.11.

9.7.3.10 Imperfections Observed During Radiological Inspection

The maximum acceptable size and distribution of slag inclusion and/or gas pocket discontinuities are shown in Tables 19 and 20 and Figures 7 and 8 (see note).

The important factors to be considered in determining rejection or acceptance limits are size and spacing of discontinuities and the sum of the diameters in an established distance. For simplicity, the distance is established as any 6 in. (152.4 mm) length. Discontinuities of this type usually occur in an aligned pattern, but no distinction is made between aligned or scattered patterns. Also, the distribution pattern may be of assorted sizes.

Note: Unless the discontinuities are elongated, it cannot be determined with assurance whether the radiological indications represent slag inclusions or gas pockets. Therefore, the same limits apply to all circular-type discontinuities.

9.7.3.11 Defects Observed During Radiological Inspection

Cracks, lack of complete penetration, lack of complete fusion, and discontinuities greater in size and/or distribution than shown in Tables 19 and 20 and Figures 7 and 8, as indicated by radiological examination, shall be considered defects. See 9.7.6 for disposition of pipe containing defects.

9.7.3.12 Disposition of Defects Observed During Radiological Inspection

Any weld defect detected as a result of radiological examination shall be rejected. Disposition of the pipe containing the defect shall be in accordance with 9.7.6.

9.7.4 Ultrasonic and Electromagnetic Inspection

9.7.4.1 Equipment

Any equipment utilizing the ultrasonic or electromagnetic principles and capable of continuous and uninterrupted inspection of the weld seam shall be used. The equipment shall be checked with an applicable reference standard as described in 9.7.4.2 at least once per 8 hours per operating shift to demonstrate its effectiveness and the inspection procedures. The equipment shall be adjusted to produce well-defined indications when the reference standard used by the manufacturer is scanned by the inspection unit in a manner simulating the inspection of the product and shall be capable of inspecting $^1/_{16}$ in. (1.6 mm) on each side of the weld line for the entire wall thickness. Restrictions on residual magnetism in pipe are given in 9.7.7.

9.7.4.2 NDT Reference Standards

Reference standards shall have the same specified diameter and thickness as the product being inspected and may be of any convenient length as determined by the manufacturer. Reference standards shall contain machined notches, one on the inside surface and one on the outside surface, or a drilled hole as shown in Figure 9, at the option of the manufacturer. The notches shall be parallel to the weld seam and shall be separated by a distance sufficient to produce two separate and distinguishable signals. The $^1/_{16}$ in. (1.6 mm) or $^1/_8$ in. (3.2 mm) hole shall be drilled through the wall and perpendicular to the surface of the reference standard as shown in Figure 9 (see note).

Note: The reference standards defined above are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

9.7.4.3 Acceptance Limits

Table 21 gives the height of acceptance limit signals produced by reference standards. An imperfection that produces a signal greater than the acceptance limit signal given in Table 21 shall be considered a defect unless it can be demonstrated by the manufacturer that the imperfection does not exceed the provisions of 7.8. Alternatively, indicated imperfections in submerged-arc welds may be reinspected by film radiological methods using 2% penetrameters, in accordance with 9.7.3.1 through 9.7.3.12.

In addition, for gas metal-arc welds, continuous flaw signals greater than 1 in. in length, regardless of signal height, but greater than the background signal (noise) shall be reinspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12 or by other techniques as agreed upon between the purchaser and the manufacturer.

9.7.4.4 Weld Repair

Defects in the filler-metal welds found by ultrasonic methods of inspection may be repaired by welding and reexamined nondestructively in accordance with Appendix B.

For PSL 1 pipe, defects in weld seams made without filler metal found by ultrasonic or electromagnetic methods of inspection may be repaired by welding and reexamined nondestructively in accordance with Appendix B, only by agreement between the purchaser and the manufacturer.

For PSL 2 pipe, defects in weld seams made without filler metal shall not be repaired by welding.

9.7.5 Magnetic Particle Inspection (PSL 1 only)

Note: For weld repairs to the pipe body, as permitted in Appendix B for PSL 1 pipe.

9.7.5.1 Equipment

The equipment used for magnetic particle inspection shall produce a magnetic field of sufficient intensity to indicate weld area defects of the following character in the external surface of the pipe: open welds, partial or incomplete welds, intermittent welds, cracks, seams, and slivers.

9.7.5.2 Reference Standard

If requested by the purchaser, arrangements shall be made by the manufacturer to perform a demonstration for the purchaser or his representative during production of his order. Such demonstration shall be based on pipe in process or sample lengths of similar pipe retained by the manufacturer for that purpose that exhibit natural or artificially produced defects of the character stated in 9.7.5.1.

9.7.5.3 Acceptance Limits

The manufacturer shall mark each magnetic particle indication and subsequently explore each indication with respect to the depth of the imperfection. Imperfections that require grinding or chipping to determine their depth shall be completely removed by grinding, or by cutting off, or may be repaired by welding and reexamined nondestructively in accordance with Appendix B.

9.7.6 Disposition of Defects

Pipe containing a defect shall be given one of the following dispositions:

a. The defect shall be removed by grinding in such a way that the ground area blends in smoothly with the contour of the pipe. Complete removal of the defect shall be verified by visual inspection of the ground area, and the wall thickness in the ground area shall be as specified in 7.3. (For arc burns, see also 7.8.11.)

b. The defect shall be repaired by welding in accordance with Appendix B, except that, for PSL 2 pipe, defects in pipe body or in seam welds made without filler metal shall not be repaired by welding.

c. The section of pipe containing the defect shall be cut off within the limits of requirements on length.

d. The entire pipe shall be rejected.

9.7.7 Residual Magnetism Measurement Requirements

The requirements of this paragraph apply only to testing within the pipe manufacturing facility. Measurements of residual magnetism on pipe, subsequent to leaving the pipe manufacturing facility, may be affected by procedures and conditions imposed on the pipe during and after shipment.

a. The longitudinal magnetic field shall be measured on the root face or square cut face of finished plain-end pipe size $6^5/_8$ and larger, and all smaller plain-end pipe that is inspected full length by magnetic methods or that is handled by magnetic equipment prior to loading.

b. Measurements shall be made using a Hall-effect gaussmeter or other type of calibrated instrument. However, in case of dispute, measurements made with a Hall-effect gaussmeter shall govern. The gaussmeter shall be operated in accordance with written instructions demonstrated to produce accurate results. The accuracy shall be verified at least once each day that the gaussmeter is used.

c. Measurements shall be made on each end of a pipe to be selected at least once per 4 hours per operating shift.

d. Pipe magnetism shall be measured subsequent to any inspection that utilizes a magnetic field, prior to loading for shipment from the manufacturer's facility. For pipe handled with electromagnetic equipment after measurement of magnetism, such handling shall be performed in a manner demonstrated not to cause residual magnetism in excess of the levels stipulated in Item e.

e. As a minimum, four readings shall be taken approximately 90° apart around the circumference of each end of the pipe. The average of the four readings shall not exceed 30 gauss (3.0 mT), and no one reading shall exceed 35 gauss (3.5 mT) when measured with a Hall-effect gaussmeter, or equivalent values when measured with other types of instruments.

f. Any pipe that does not meet the requirements of 9.7.7, Item e, shall be considered defective. In addition, all pipe produced between the defective pipe and the last acceptable pipe shall be individually measured. Alternatively, if the pipe production sequence is documented, pipe may be measured in reverse sequence beginning with the pipe produced prior to the defective pipe until at least three consecutively produced pipes meet the requirements; pipe produced prior to the three acceptable pipes need not be measured.

Pipe produced after the defective pipe shall be measured individually until at least three consecutive pipes meet the requirements.

Measurements made on pipe in stacks or bundles are not considered valid.

All defective pipe shall be degaussed full length, and remeasured until at least three consecutive pipes meet the requirements.

9.8 TEST METHODS

9.8.1 Methods of Chemical Analysis

Methods and practices relating to chemical analysis shall be performed in accordance with ASTM A 751, *Methods, Practices, and Definitions for Chemical Analysis of Steel Products*. Calibrations performed shall be traceable to established standards.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:39 2005

9.8.2 Tensile Test

9.8.2.1 Test Method

The tensile testing procedure shall conform to the requirements of ASTM A 370, *Methods and Definitions for Mechanical Testing of Steel Products*. All tensile tests, except transverse weld and ring tests, shall include yield strength, ultimate tensile strength, and elongation determinations and shall be performed with the specimens at room temperature. The strain rate shall be in accordance with the requirements of ASTM A 370.

9.8.2.2 Equipment

Tensile test machines shall have been calibrated within 15 months preceding any test in accordance with the procedures of ASTM E 4, *Practices for Load Verification of Testing Machines*. Where yield strength is determined by the use of extensometers, such extensometers shall be calibrated within the preceding 15 months in accordance with the procedures of ASTM E 83, *Method of Verification and Classification of Extensometers*.

9.8.3 Guided-Bend Test

One face-bend and one root-bend specimen, both conforming to Figure 10, shall be bent approximately 180° in a jig substantially in accordance with Figure 11. For any combination of specified outside diameter, specified wall thickness, and grade, the maximum value for jig dimension A in Figure 11 may be calculated using the equation shown. The manufacturer shall use a jig based on this dimension, or a smaller dimension at his option; however, to minimize the number of jigs required, standard values for dimension A have been selected for pipe sizes $12^3/_4$ and larger. These values are listed for each size, specified wall thickness, and grade in Appendix G. For intermediate grades or specified wall thicknesses, the next smaller standard value for dimension A shall be used. When dimension A is greater than 9 in. (228.6 mm), the length of the specimen required to contact the male die need not exceed 9 in. (228.6 mm). For pipe with wall thickness over 0.750 in. (19.1 mm), a reduced wall specimen as shown in Figure 10 may be used at the option of the manufacturer. Reduced wall specimens shall be tested in a jig with the A dimension calculated for 0.750 in. (19.1 mm) wall pipe of the appropriate size and grade. The specimens (a) shall not fracture completely; (b) shall not reveal any cracks or ruptures in the weld metal greater than $^1/_8$ in. (3.18 mm) in length regardless of depth; and (c) shall not reveal any cracks or ruptures in the parent metal, heat affected zone, or fusion line longer than $^1/_8$ in. (3.18 mm) and deeper than $12^1/_2\%$ of the specified wall thickness; except cracks that occur at the edges of the specimen and are less than $^1/_4$ in. (6.35 mm) long shall not be cause for rejection in (b) or (c) above regardless of depth.

9.8.4 Charpy Test

Charpy tests shall be performed by the manufacturer in accordance with ASTM A370, *Methods and Definitions for Mechanical Testing of Steel Products*.

For purposes of determining conformance with these Charpy V-notch fracture toughness requirements, observed and calculated values shall be rounded to the nearest whole number in accordance with the rounding method of ASTM E 29, *Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications*. Observed values that are rounded will be referred to as individual readings.

When subsize specimens are used, the individual readings and the average of the three readings are divided by the ratio of the specimen width tested to the full-size specimen width and compared with the full-size acceptance criteria.

For acceptance, the average absorbed energy of the three individual specimens from a length shall not be less than the required full-size value. In addition, the individual test value for any specimen shall not be less than three-fourths of the required minimum average absorbed energy value.

9.9 INVALIDATION OF TESTS

9.9.1 Defective Tensile Test Specimens

When the elongation of any tensile test specimen is less than that specified and if any part of the fracture is outside the middle third of the gage length as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

9.9.2 Defective Mechanical Test Specimens

For any of the mechanical tests in Section 6, any test specimen that shows defective preparation or material imperfections unrelated to the intent of the particular mechanical test, whether observed before or after testing, may be discarded and replaced by another specimen from the same length of pipe.

9.10 RETESTS

9.10.1 Recheck Analyses

If the product analyses of both samples representing the heat fail to conform to the specified requirements, at the manufacturer's option either the heat shall be rejected or the remainder of the heat shall be tested individually for conformance to the specified requirements. If the product analysis of only one of the samples representing the heat fails to conform to the specified requirements, at the manufacturer's option either the heat shall be rejected or two recheck analyses shall be made using two additional samples from the heat. If both recheck analyses conform to the specified requirements, the heat shall be accepted, except for the pipe, plate, or skelp from which the initial sample that failed was taken. If one or both recheck analyses fail to conform to the specified

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:39 2005

requirements, at the manufacturer's option either the heat shall be rejected or the remainder of the heat shall be tested individually for conformance to the specified requirements.

For such individual testing, analyses for only the rejecting element or elements need be determined.

Samples for recheck analyses shall be taken in the same location as specified for product analysis samples

9.10.2 Retests

If the tensile test specimen representing a lot of pipe fails to conform to the specified requirements, the manufacturer may elect to retest two additional lengths from the same lot. If both retested specimens conform to the specified requirements, all the lengths in a lot shall be accepted, except the length from which the initial specimen was taken. If one or both of the retested specimens fail to conform to the specified requirements, the manufacturer may elect to individually test the remaining lengths in the lot, in which case determinations are required only for the particular requirements with which the specimens failed to comply in the preceding tests. Specimens for retest shall be taken in the same manner as the specimen that failed to meet the minimum requirements.

9.10.3 Flattening Retest

Flattening retest provisions are as follows:

a. Nonexpanded electric welded pipe in grades higher than A25 and nonexpanded laser welded pipe smaller than $12^3/_4$, produced in single lengths—The manufacturer may elect to retest any failed end until the requirements are met, providing the finished pipe is not less than 80% of its length after initial cropping.

b. Nonexpanded electric welded pipe produced in grades higher than A25 and nonexpanded laser-welded pipe smaller than $12^3/_4$, produced in multiple lengths—The manufacturer may elect to retest each end of each individual length if any test fails. The retests for each end of each individual length shall be made with the weld alternately at 0° and 90°.

c. Cold-expanded electric welded pipe in grades higher than A25; all welded Grade A25 in sizes $2^7/_8$ and larger; and cold-expanded laser welded pipe smaller than size $12^3/_4$—The manufacturer may elect to retest one end from each of two additional lengths of the same lot. If both retests are acceptable, all lengths in the lot shall be accepted, except the original failed length. If one or both retests fail, the manufacturer may elect to repeat the test on specimens cut from one end of each of the remaining individual lengths in the lot.

9.10.4 Bend Retest

If the specimen fails to conform to the specified requirements, the manufacturer may elect to make retests on specimens cut from two additional lengths from the same lot. If all retest specimens conform to the specified requirements, all lengths in the lot shall be accepted, except the length from which the initial specimen was taken. If one or more of the retest specimens fail to conform to the specified requirements, the manufacturer may elect to repeat the test on specimens cut from the individual lengths remaining in the lot.

9.10.5 Guided-Bend Retest

If one or both of the guided-bend specimens fail to conform to the specified requirements, the manufacturer may elect to repeat the tests on specimens cut from two additional lengths of pipe from the same lot. If such specimens conform to the specified requirements, all lengths in the lot shall be accepted, except the length initially selected for test. If any of the retested specimens fail to pass the specified requirements, the manufacturer may elect to test specimens cut from the individual lengths remaining in the lot. The manufacturer may also elect to retest any length that has failed to pass the test by cropping back and cutting two additional specimens from the same end. If the requirements of the original test are met by both of these additional tests, that length shall be acceptable. No further cropping and retesting is permitted. Specimens for retests shall be taken in the same manner as specified in 9.8.3.

9.10.6 Weld Ductility Retest

If the weld ductility test specimen representing a lot of pipe fails to conform to the requirements of 6.2.5, the manufacturer may elect to retest two additional lengths from the same lot. If both retested specimens conform to the specified requirements, all the lengths in the lot shall be accepted, except the length from which the initial specimen was taken. If one or both of the retested specimens fail to conform to the specified requirements, the manufacturer may elect to test specimens cut from one end of the individual lengths remaining in the lot. Precaution shall be taken so that the specimens can be identified with the length of pipe from which they were cut. The manufacturer may also elect to retest any length that has failed to pass the above test procedure by cropping back and cutting two additional specimens from the same end. If the weld ductility test requirements are met by both of these additional tests, that length shall be acceptable. No further cropping and retesting is permitted.

9.10.7 Charpy Retests

In the event that a set of Charpy test specimens fails to meet the acceptance criteria, the manufacturer may elect to replace the lot of material involved or alternatively to test two more lengths from that lot. If both of the new tests meet the acceptance criteria, then all pipe in that heat, with the exception of the original selected length, shall be considered to meet the

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:39 2005

requirement. Failure of either of the two additional tests shall require testing of each length in the lot for acceptance.

9.11 REPROCESSING

If any mechanical property test result for a lot of pipe, as defined in 9.3, fails to conform to the applicable requirements, the manufacturer may elect to heat treat the lot of pipe in accordance with the requirements of 5.4, consider it a new lot, test it in accordance with all requirements of 6.2 and 9.3, SR5, and SR6 that are applicable to the order item, and proceed in accordance with the applicable requirements of this specification. After one reprocessing heat treatment, any additional reprocessing heat treatment shall be subject to agreement with the purchaser.

For non-heat treated pipe, any reprocessing heat treatment shall be subject to agreement with the purchaser. For heat treated pipe, any reprocessing with a different type of heat treatment (see 5.4) shall be subject to agreement with the purchaser.

10 Marking

10.1 GENERAL

Pipe and pipe couplings manufactured in conformance with this specification shall be marked by the manufacturer as specified herein (see note).

Note: Users of this specification should note that there is no longer a requirement for marking a product with the API monogram. API continues to license use of the monogram on products covered by this specification, but it is administered by the staff of the Institute separately from the specification. The policy describing use of the monogram is contained in Appendix I. No other use of the monogram is permitted. Licensees mark products in conformance with Section 10 or Appendix I and nonlicensees mark products in conformance with Section 10.

10.1.1 The required marking on pipe shall be as specified hereinafter.

10.1.2 The required marking on couplings shall be die stamped unless otherwise agreed between the purchaser and the manufacturer, in which case it shall be paint stenciled.

10.1.3 Additional markings including those for compatible standards following the specification marking are allowed and may be applied as desired by the manufacturer or as requested by the purchaser.

10.2 LOCATION OF MARKINGS

The location of identification markings shall be as follows:

a. Size 1.900 or smaller—Die stamped on a metal tag fixed to the bundle or may be printed on the straps or banding clips used to tie the bundle.

b. Seamless pipe in all other sizes and welded pipe smaller than size 16—Paint stencil on the outside surface starting at a point between 18 in. and 30 in. (457.2 mm and 762 mm) from the end of the pipe in the sequence shown in 10.3, except when agreed between the purchaser and the manufacturer some or all of the markings may be placed on the inside surface in a sequence convenient to the manufacturer.

c. Welded pipe size 16 and larger—Paint stencil on the inside surface starting at a point no less than 6 in. (152.4 mm) from the end of the pipe in a sequence convenient to the manufacturer, unless otherwise specified by the purchaser.

10.3 SEQUENCE OF MARKINGS

The sequence of identification markings shall be as specified in 10.3.1 through 10.3.10.

10.3.1 Manufacturer

Manufacturer's name or mark shall be the first identifying mark.

10.3.2 Specification

"Spec 5L" shall be marked when the product is in complete compliance with this specification.

10.3.3 Compatible Standards

Products in compliance with multiple compatible standards may be marked with the name of each standard.

10.3.4 Specified Dimensions

The specified outside diameter and the specified wall thickness shall be marked, except that, for the specified outside diameter, any ending zero digits to the right of the decimal need not be included in such markings.

10.3.5 Grade and Class

The symbols to be used are as follows:

Grade (see Note)	Symbol
A25, Class I	A25
A25, Class II	A25R
A	A
B	B
X42	X42
X46	X46
X52	X52
X56	X56
X60	X60
X65	X65
X70	X70
X80	X80

For grades intermediate to X42 and X80, the symbol shall be X followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:40 2005

By agreement between the purchaser and the manufacturer and when so specified on the purchase order, the grade shall be identified by color in accordance with SR3 (see Appendix F).

Note: See 1.3 for limitations on downgrading.

10.3.6 Product Specification Level

The symbols to be used are as follows:

a. PSL 1	PSL1
b. PSL 2	PSL2

The PSL marking shall be placed immediately after the grade symbol.

10.3.7 Process of Manufacture

The symbols to be used are as follows:

a. Seamless pipe	S
b. Welded pipe, except continuous welded and laser welded	E
c. Continuous welded pipe	F
d. Laser welded pipe	L

10.3.8 Heat Treatment

The symbols to be used are as follows:

a. Normalized or normalized and tempered	HN
b. Subcritical stress relieved	HS
c. Subcritical age hardened	HA
d. Quench and tempered	HQ

10.3.9 Test Pressure

When the specified hydrostatic test pressure is higher than the tabulated pressure (Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable), the word "TESTED" shall be marked, immediately followed by the specified test pressure (in pounds per square inch for pipe ordered in U.S. Customary units, or in hundreds of kilopascals for pipe ordered in SI units).

10.3.10 Supplementary Requirements

See Appendix F for supplementary requirements.

10.3.11 Examples

a. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade B, PSL 2, seamless, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 14 0.375 B PSL2 S
or
AB CO Spec 5L 355.6 9.5 B PSL2 S

b. Size $6^5/_8$, 0.280 in. (7.1 mm) specified wall thickness, Grade B, PSL 1, electric welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 6.625 0.280 B PSL1 E
or
AB CO Spec 5L 168.3 7.1 B PSL1 E

c. Size $4^1/_2$, 0.237 in. (6.0 mm) specified wall thickness, Grade A25, Class I, continuous welded, threaded-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 4.5 0.237 A25 PSL1 F
or
AB CO Spec 5L 114.3 6.0 A25 PSL1 F

d. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade X70, PSL 2, seamless, quenched and tempered, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 14 0.375 X70 PSL2 S HQ
or
AB CO Spec 5L 355.6 9.5 X70 PSL2 S HQ

e. Size $12^3/_4$, 0.330 in. (8.4 mm) specified wall thickness, Grade X42, PSL 1, seamless plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 12.75 0.330 X42 PSL1 S
or
AB CO Spec 5L 323.9 8.4 X42 PSL1 S

f. Size $6^5/_8$, 0.216 in. (5.5 mm) specified wall thickness, Grade X42, PSL 1, laser welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 6.625 0.216 X42 PSL1 L
or
AB CO Spec 5L 168.3 5.5 X42 PSL1 L

g. Size 24, 0.406 in. (10.3 mm) specified wall thickness, Grade X42, PSL 2 helical seam submerged-arc welded plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 24 0.406 X42 PSL2 E
or
AB CO Spec 5L 610 10.3 X42 PSL2 E

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:40 2005

10.4 BUNDLE IDENTIFICATION

For pipe of size 1.900 or smaller, the identification markings specified in 10.3 shall be placed on the tag, strap, or clip used to tie the bundle. For example, size 1.900, 0.145 in. (3.7 mm) specified wall thickness, Grade B, electric welded, plain-end pipe should have the following marking, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 1.9 0.145 B PSL1 E
or
AB CO Spec 5L 48.3 3.7 B PSL1 E

10.5 LENGTH

In addition to the identification markings stipulated in 10.2, 10.3, and 10.4, the length shall be marked as follows, using feet and tenths of a foot for pipe ordered in U.S. Customary units, or meters to two decimal places for pipe ordered in SI units, unless a different measuring and marking format has been agreed upon by the purchaser and the manufacturer:

a. For pipe larger than size 1.900, the length, as measured on the finished pipe, shall be paint stenciled on the outside surface at a location convenient to the manufacturer, or by agreement between the purchaser and the manufacturer, on the inside surface at a convenient location.
b. For pipe of size 1.900 or smaller, the total length of pipe in the bundle shall be marked on the tag, band, or clip.

10.6 COUPLINGS

All couplings in sizes $2^3/_8$ and larger shall be identified with the manufacturer's name or mark and "Spec 5L".

10.7 DIE STAMPING

Cold die stamping is prohibited on all pipe with specified wall thickness of 0.156 in. (4.0 mm) or less and all pipe of grades higher than A25 and not subsequently heat treated, except by agreement between the purchaser and the manufacturer and when so specified on the purchase order, pipe or plate may be cold die stamped. The manufacturer at his option may hot die stamp [200°F (93°C) or higher] plate or pipe, cold die stamp plate or pipe if it is subsequently heat treated, and cold die stamp couplings. Cold die stamping shall be done with rounded or blunt dies. All die stamping shall be at least 1 in. (25.4 mm) from the weld for all grades except Grade A25.

10.8 THREAD IDENTIFICATION

At the manufacturer's option, threaded-end pipe may be identified by stamping or stenciling the pipe adjacent to the threaded ends, with the manufacturer's name or mark, "Spec 5B" (to indicate the applicable threading specification), the specified outside diameter of the pipe, and the letters "LP" (to indicate the type of thread). The thread marking may be applied to products that do or do not bear the API monogram. For example, size $6^5/_8$ threaded-end pipe may be marked as follows, using the value that is appropriate for the pipe outside diameter specified on the purchase order:

AB CO Spec 5B 6.625 LP
or
AB CO Spec 5B 168.3 LP

If the product is clearly marked elsewhere with the manufacturer's identification, his name or mark, as above, may be omitted.

10.9 THREAD CERTIFICATION

The use of the letters "Spec 5B" as provided in 10.8 shall constitute a certification by the manufacturer that the threads so marked comply with the requirements in API Standard 5B but should not be construed by the purchaser as a representation that the product so marked is, in its entirety, in accordance with any API specification. Manufacturers who use the letters "Spec 5B" for thread identification are required to have access to properly certified API master pipe gages.

10.10 PIPE PROCESSOR MARKINGS

Pipe heat treated by a processor other than the original pipe manufacturer shall be marked as stipulated in 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, and 10.7. The processor shall remove any marking that does not indicate the new condition of the product as a result of heat treating (such as prior grade identity and original pipe manufacturer's name or logo).

11 Coating and Protection

11.1 COATINGS

Unless otherwise specified in the purchase order, pipe shall be supplied either uncoated (bare) or with a temporary external coating to minimize rusting in transit, at the option of the manufacturer. Temporary coatings should be hard to the touch and smooth, with minimum sags.

If the purchaser requires pipe to be uncoated, or to have a temporary or special coating, the purchase order should so state.

For special coatings, the purchase order should state whether the coating is to be applied full length, or with a specified cutback (uncoated distance at each pipe end). Unless otherwise specified, the manufacturer has the option to leave the pipe ends either coated or uncoated, and the option to apply a temporary coating to the pipe ends.

11.2 THREAD PROTECTORS

On pipe smaller than size $2^3/_8$, the thread protectors shall be suitable fabric wrappings or suitable metal, fiber, or plastic protectors. On pipe of sizes $2^3/_8$ and larger, the thread protectors shall be of such design, material, and mechanical strength to protect the thread and end of the pipe from damage under normal handling and transportation conditions. The thread protectors shall cover the full length of the thread on the pipe and

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:40 2005

exclude water and dirt from the thread during transportation and the period of normal storage. The normal storage period shall be considered approximately one year. The thread forms in protectors shall be such that the pipe threads are not damaged by the protectors. Protector material shall contain no compounds capable of causing corrosion or promoting adherence of the protectors to the threads and shall be suitable for service temperatures of – 50°F to + 150°F (– 46°C to + 66°C).

12 Documents

12.1 CERTIFICATION

12.1.1 PSL 1 Certification Requirements

The manufacturer shall, upon request by the purchaser, furnish to the purchaser a certificate of compliance stating that the material has been manufactured, sampled, tested, and inspected in accordance with this specification and has been found to meet the requirements.

A Material Test Report, Certificate of Compliance or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of this specification and conform to any existing EDI agreement between the purchaser and supplier.

Where additional information is required, including the results of mechanical testing, SR15 shall be specified on the purchase order (see Appendix F).

12.1.2 PSL 2 Certification Requirements

The manufacturer shall provide to the purchaser certificates of compliance and test results in compliance with SR15.1 (see Appendix F).

12.2 RETENTION OF RECORDS

Tests and inspections requiring retention of records in this specification are shown in Table 22. Such records shall be retained by the manufacturer and shall be made available to the purchaser upon request for a 3-year period after the date of purchase from the manufacturer.

13 Pipe Loading

When the manufacturer is responsible for the shipment of pipe, the manufacturer shall prepare and follow loading diagrams which detail how the pipe is arranged, protected, and secured on trucks, railcars, barges or oceangoing vessels, as applicable. The loading shall be designed to prevent end damage, abrasion, peening, and fatigue cracking. The loading shall comply with any rules, codes, standards, or recommended practices which are applicable. Examples of these may include but are not limited to:

American Association of Railroads—*General Rules Governing the Loading of Commodities on Open Top Cars*

American Association of American Railroads—*Rules Governing the Loading of Steel Products Including Pipe on Open Top Cars*

API RP 5L1—*Recommended Practice for Railroad Transportation of Line Pipe*

API RP 5LW—*Recommended Practice for Transportation of Line Pipe on Barges and Marine Vessels*

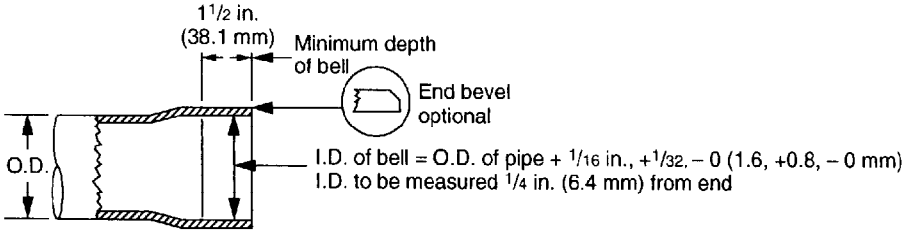

Figure 1—Belled End for Bell and Spigot Joint

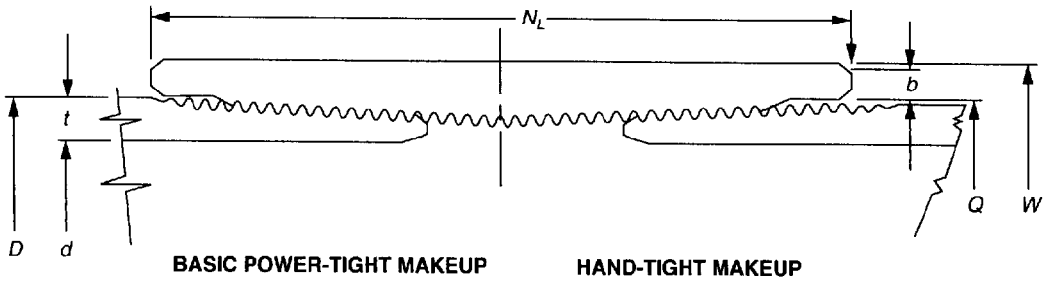

Note: See Tables 4 and 5 for pipe dimensions, Table 12 for coupling dimensions, and API Standard 5B for thread details.

G – Round Bar Specimen

The larger possible of either the 0.500-in. (12.7 mm) or 0.350-in. (8.9 mm) diameter specimen shall be used.

TRANSVERSE SPECIMENS

Notes:
1. See 9.3.1.1 for alternative gage width.
2. Flattening of transverse and weld specimens shall be performed at room temperature.
3. Hot flattening, artificial aging, or heat treatment of tensile specimens is not permitted.

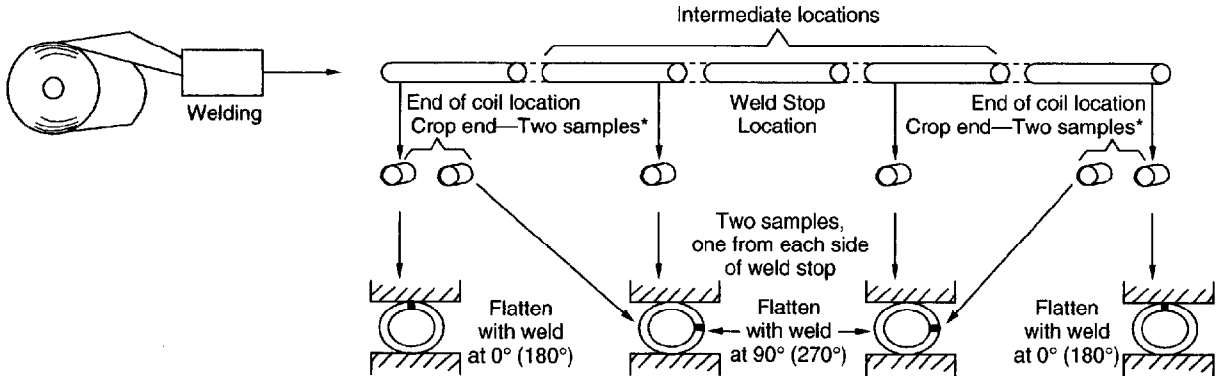
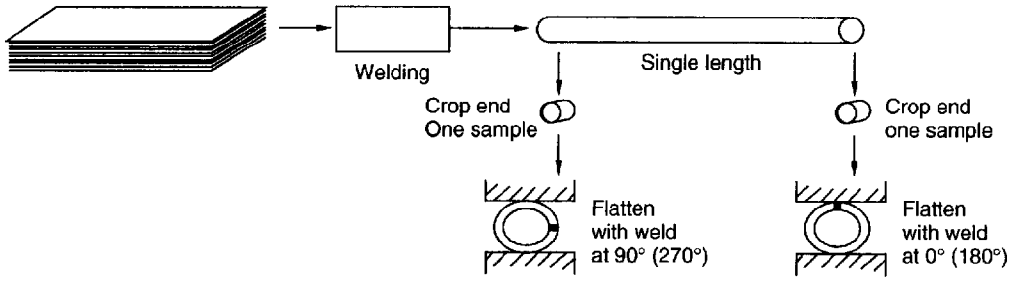
ELECTRIC WELDED PIPE GRADES HIGHER THAN A25 AND LASER WELDED PIPE SMALLER THAN SIZE 12 3/4—NONEXPANDED IN MULTIPLE LENGTHS

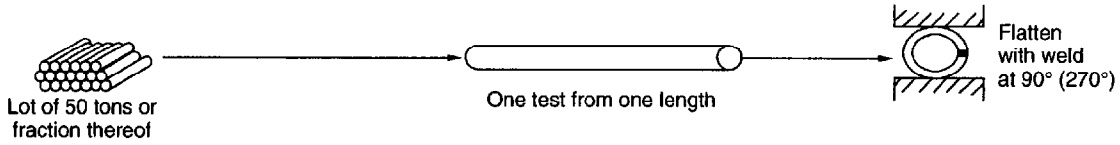


*For 0° (180°) orientation tests, intermediate locations may be substituted for coil end locations.

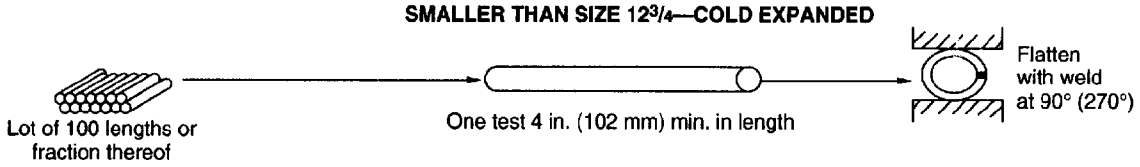
ELECTRIC WELDED PIPE IN GRADES HIGHER THAN A25—NONEXPANDED PRODUCED IN SINGLE LENGTHS



GRADE A25 WELDED PIPE SIZE 2 7/8 AND LARGER

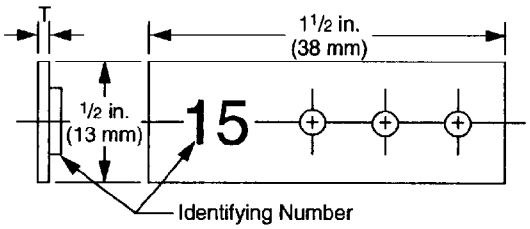


ELECTRIC WELDED PIPE IN GRADES HIGHER THAN A25 AND LASER WELDED PIPE SMALLER THAN SIZE 12 3/4—COLD EXPANDED



Note: See 9.3.2

Figure 5—Flattening Tests



Notes:
1. The diameter of each hole shall be 1/16 in. (1.6 mm).
2. Holes shall be round and drilled perpendicular to the surface.
3. Holes shall be free of burrs, but edges shall not be chamfered.
4. Each penetrameter shall carry a lead identification number as given in Tables 14 and 15.

Table 1—Process of Manufacture and Product Specification Level (PSL)

	PSL 1[a]			PSL 2[b]
	Grade			Grade
Process of Manufacture	A25[c]	A & B	X42 through X70	B through X80
Type of Pipe				
Seamless	X	X	X	X
Welded without Filler Metal				
Continuous welded[c]	X			
Electric welded	X	X	X	X
Laser welded	X	X	X	
Welded with Filler Metal				
Longitudinal seam submerged-arc welded		X	X	X
Gas metal-arc welded		X	X	X
Combination gas metal-arc welded		X	X	X
Double seam submerged-arc welded[d]		X	X	X
Double seam gas metal-arc welded[d]		X	X	X
Double seam combination gas metal-arc welded and submerged-arc welded[d]		X	X	X
Helical seam submerged-arc welded[e]		X	X	X
Type of Pipe End				
Belled End[f]	X	X	X	
Plain End	X	X	X	X
Plain End for Special Coupling	X	X	X	
Threaded End[g]	X	X		

[a]PSL 1 is limited to sizes from 0.405 through 80.

[b]PSL 2 is limited to sizes from $4^1/_2$ through 80.

[c]Grade A25, and thus continuous welded pipe (which is limited to A25), is limited to sizes $5^9/_{16}$ and smaller.

[d]Double seam pipe is limited to sizes 36 and larger.

[e]Helical seam pipe is limited to sizes $4^1/_2$ and larger.

[f]Belled end pipe is limited to wall thicknesses of 0.141 in. (3.6 mm) and less; sizes are limited to $8^5/_8$ and smaller.

[g]Threaded pipe and couplings are limited to sizes 20 and smaller; helical seam pipe is excluded.

Footnotes to Tables 2A and 2B:

[a]For each reduction of 0.01% below the specified maximum carbon content, an increase of 0.05% above the specified maximum manganese content is permissible, up to a maximum of 1.50% for Grades X42 through X52, up to a maximum of 1.65% for grades higher than X52 but less than X70, and up to 2.00% for Grades X70 and higher.

[b]Columbium [niobium], vanadium, titanium, or combinations thereof may be used by agreement between the purchaser and manufacturer.

[c]Columbium [niobium], vanadium, titanium, or combinations thereof may be used at the discretion of the manufacturer.

[d]The sum of the columbium [niobium], vanadium, and titanium contents shall not exceed 0.15%.

[e]Other chemical compositions may be furnished by agreement between purchaser and manufacturer, providing that the limits of Footnote d, and the tabular limits for phosphorus and sulfur are met.

Footnotes to Tables 3A and 3B:

[a]The minimum elongation in 2 in. (50.8 mm) shall be that determined by the following equation:

U.S. Customary Unit Equation

$$e = 625{,}000\frac{A^{0.2}}{U^{0.9}}$$

SI Unit Equation

$$e = 1{,}944\frac{A^{0.2}}{U^{0.9}}$$

where

e = minimum elongation in 2 in. (50.8 mm) in percent rounded to the nearest percent.

A = applicable tensile test specimen area, as follows:

a. For both sizes of round bar specimens, 0.20 in.^{2} (130 mm^2);

b. For full section specimens, the smaller of (i) 0.75 in.^{2} (485 mm^2) and (ii) the cross-sectional area of the test specimen, calculated using the specified outside diameter of the pipe and the specified wall thickness of the pipe, rounded to the nearest 0.01 in.^{2} (10 mm^2); and

c. For strip specimens, the smaller of (i) 0.75 in.^{2} (485 mm^2) and (ii) the cross-sectional area of the test specimen, calculated using the specified width of the test specimen and the specified wall thickness of the pipe, rounded to the nearest 0.01 in.^{2} (10 mm^2).

U = specified minimum ultimate tensile strength in psi (MPa).

See Appendix D for the specified minimum elongation values for various tensile specimen sizes and grades.

[b]Maximum yield strength for an intermediate grade shall be the maximum for the next higher listed grade.

[c]All intermediate grades have a maximum ultimate tensile strength of 110,000 psi (758 MPa).

[d]Maximum yield strength for Grade B pipe in sizes subject to longitudinal testing is 72,000 psi (496 MPa).

[e]For wall thickness greater than 0.984 inch (25.0 mm), the maximum yield strength shall be determined by agreement between the purchaser and the manufacturer.

Table 6B (Continued)—Plain-End Line Pipe Dimensions, Weights per Unit Length, and Test Pressures for Sizes $2^3/_8$ through $5^9/_{16}$ (U.S. Customary Units)

(1)	(2)	(3)	(4)	(5)		(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)	(15)	(16)
	Specified Outside Diameter	Specified Wall Thickness	Plain-End Weight per Unit Length	Calculated Inside Diameter[a]		Minimum Test Pressure (psi)[b]										
Size	D (in.)	t (in.)	w_{pe} (lb/ft)	d (in.)		Grade A25	Grade A	Grade B	Grade X42	Grade X46	Grade X52	Grade X56	Grade X60	Grade X65	Grade X70	Grade X80
$5^9/_{16}$	5.563	0.750	38.59	4.063	Std.	2800	2800	2800	3000	3000	3000	3000	3000	3000	3000	3000
					Alt.	—	2800	2800	7260	7260	7260	7260	7260	7260	7260	7260

Note: See Table E-6B for SI unit values corresponding to the U.S. Customary unit values given in this table.

[a]The calculated inside diameters are given here for information (see 7.2).

[b]The test pressures given in Tables 6A, 6B, and 6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

[c]Pipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

Note: See Table E-6C for SI unit values corresponding to the U.S. Customary unit values given in this table.

[a]The calculated inside diameters are given here for information (see 7.2).

[b]The test pressures given in Tables 6A, 6B, and 6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

[c]Pipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

Table 7—Tolerances for Diameter of Pipe Body

Size	Tolerance[a] (with respect to specified outside diameter)
< $2^3/_8$	+ 0.016 in., – 0.031 in. (+ 0.41 mm, – 0.79 mm)
≥ $2^3/_8$ and ≤ $4^1/_2$, continuous welded	± 1.00%
≥ $2^3/_8$ and < 20	± 0.75%
≥ 20, seamless	± 1.00%
≥ 20 and ≤ 36, welded	+ 0.75%, – 0.25%
> 36, welded	+ $^1/_4$ in., – $^1/_8$ in. (+ 6.35 mm, – 3.20 mm)

[a]In the case of pipe hydrostatically tested to pressures in excess of standard test pressures, other tolerances may be agreed upon between the manufacturer and the purchaser.

Table 8—Tolerance for Diameter at Pipe Ends

				Out-of-Roundness	
Size	Minus Tolerance	Plus Tolerance	End-to-End Tolerance	Diameter, Axis Tolerance (Percent of Specified OD)[a]	Maximum Differential Between Minimum and Maximum Diameters (Applies Only to Pipe With $D/t \leq 75$)
≤ $10^3/_4$	$^1/_{64}$ (0.40 mm)	$^1/_{16}$ (1.59 mm)	—	—	—
> $10^3/_4$ and ≤ 20	$^1/_{32}$ (0.79 mm)	$^3/_{32}$ (2.38 mm)	—	—	—
> 20 and ≤ 42	$^1/_{32}$ (0.79 mm)	$^3/_{32}$ (2.38 mm)	b	± 1%	≤ 0.500 in. (12.7 mm)
> 42	$^1/_{32}$ (0.79 mm)	$^3/_{32}$ (2.38 mm)	b	± 1%	≤ 0.625 in. (15.9 mm)

[a]Out-of-roundness tolerances apply to maximum and minimum diameters as measured with a bar gage, caliper, or device measuring actual maximum and minimum diameters.

[b]The average diameter (as measured with a diameter tape) of one end of pipe shall not differ by more than $^3/_{32}$ in. (2.38 mm) from that of the other end.

Table 9—Tolerances for Wall Thickness

		Tolerance[a] (Percent of Specified Wall Thickness)	
Size	Type of Pipe	Grade B or Lower	Grade X42 or Higher
≤ $2^7/_8$	All	+ 20.0, – 12.5	+ 15.0, –12.5
> $2^7/_8$ and < 20	All	+ 15.0, – 12.5	+ 15.0, –12.5
≥ 20	Welded	+ 17.5, –12.5	+ 19.5, –8.0
≥ 20	Seamless	+ 15.0, –12.5	+ 17.5, –10.0

[a]Where negative tolerances smaller than those listed are specified by the purchaser, the positive tolerance shall be increased to the applicable total tolerance range in percent less the wall thickness negative tolerance.

Wed Feb 02 00:34:55 2005

Table 10—Tolerances for Weight

Quantity	Tolerance (percent)
Single lengths, special plain-end pipe or A25 pipe	+10, −5.0
Single lengths, other pipe	+10, −3.5
Carloads, Grade A25, 40,000 lb (18 144 kg) or more	−2.5
Carloads, other than Grade A25, 40,000 lb (18 144 kg) or more	−1.75
Carloads, all grades, less than 40,000 lb (18 144 kg)	−3.5
Order items, Grade A25, 40,000 lb (18 144 kg) or more	−3.5
Order items, other than Grade A25, 40,000 lb (18 144 kg) or more	−1.75
Order items, all grades, less than 40,000 lb (18 144 kg)	−3.5

Notes:
1. Weight tolerances apply to the calculated weights for threaded-and-coupled pipe and to the tabulated or calculated weights for plain-end pipe. Where negative wall thickness tolerances smaller than those listed in Table 9 are specified by the purchaser, the plus weight tolerance for single lengths shall be increased to 22.5 percent less the wall thickness negative tolerance.
2. For carloads composed of pipe from more than one order item, the carload tolerances are to be applied on an individual order item basis.
3. The tolerances for order items apply to the overall quantity of pipe shipped for the order item.

Table 11—Tolerances on Lengths

Nominal Length[a]		Minimum Length		Minimum Average Length for Each Order Item[b]		Maximum Length	
ft	m	ft	m	ft	m	ft	m
			Threaded-and-Coupled Pipe				
20	6	16.0	4.88	17.5	5.33	22.5	6.86
40	12	22.0	6.71	35.0	10.67	45.0	13.72
			Plain-End Pipe				
20	6	9.0	2.74	17.5	5.33	22.5	6.86
40	12	14.0	4.27	35.0	10.67	45.0	13.72
50	15	17.5	5.33	43.8	13.35	55.0	16.76
60	18	21.0	6.40	52.5	16.00	65.0	19.81
80	24	28.0	8.53	70.0	21.34	85.0	25.91

[a]Nominal lengths of 20 ft (6 m) were formerly designated "single random lengths" and those of 40 ft (12 m) "double random lengths."
[b]By agreement between the purchaser and the manufacturer, these tolerances shall apply to each carload.

Table 13—Maximum Inspection Lot Size for Tensile Testing

(1)	(2)	(3)	(4)
Size	Tensile Tests	Weld Tensile Tests	Control Tensile Tests
≤ 1.900, A25 Welded	25 tons (22.7 Mg)	—	—
> 1.900, A25 Welded	50 tons (45.5 Mg)	—	—
≤ $5^{9}/_{16}$, except A25 Welded	400 lengths	—	Heat of steel
> $5^{9}/_{16}$ and < $8^{5}/_{8}$	200 lengths[a]	—	Heat of steel
≥ $8^{5}/_{8}$ through $12^{3}/_{4}$	200 lengths[a]	200 lengths	Heat of steel
> $12^{3}/_{4}$	100 lengths[a] per cold expansion amount[b]	100 lengths[c] per cold expansion amount[b]	Heat of steel

[a]An inspection lot shall consist of pipe that is made to the same size and the same specified wall thickness by the same process and under the same manufacturing conditions. For pipe of grades higher than A25 in sizes greater than $5^{9}/_{16}$, an inspection lot shall not contain more than one heat of steel.
[b]Pipe manufactured with the same nominal amount of cold expansion, ± 0.2%, shall be considered to have the same cold expansion amount.
[c]Each weld for two-seam pipe.

Note: The test frequency is one test per inspection lot. (See 9.3.1.2.)

Table 14—Relationship Between Pipe Dimensions and Required Charpy Specimens

Notes:
1. This table provides a description of the required specimens and the relationship between pipe dimensions and acceptable specimens. The size limits for transverse specimens shown are based upon the use of nonflattened, tapered end, test specimens.
2. All specimen dimension limits include machining tolerances.
3. Pipe in size and wall thickness combinations not covered by this table are not required to be tested.

APPENDIX A—SPECIFICATION FOR WELDED JOINTERS (NORMATIVE)

A.1 Method

Welding of any type that uses deposited filler metal and is generally recognized as sound practice shall be permitted unless the purchaser specifies a particular method. Welding procedures, welders, and welding machine operators (hereafter called operators) shall be qualified in accordance with API Standard 1104. Copies of the welding procedure specification and procedure qualification record shall be provided to the purchaser upon request.

A.2 Workmanship

The ends of the pipe to be welded together shall be prepared in accordance with the requirements of the procedure to be used. Pipe weld seams (straight, helical, or skelp end) shall be staggered between 2 in. and 8 in. (51 mm and 203 mm) unless otherwise specified by the purchaser. The completed jointers shall be straight within the limits of 7.6 of this specification. Each weld shall have a substantially uniform cross section around the entire circumference of the pipe. At no point shall its crowned surface be below the outside surface of the parent metal nor shall it rise above the parent metal by more than $^1/_8$ in. (3.18 mm) if submerged-arc welded, or by more than $^1/_{16}$ in. (1.59 mm), if welded by another process.

A.3 Marking

Each jointer shall be marked using paint to identify the welder or operator.

A.4 Nondestructive Testing

The girth welds of jointers shall be 100% radiographed in accordance with the procedures and standards of acceptability in API Standard 1104 (see note). Jointer welds failing to pass this radiographic testing may be repaired and re-radiographed in accordance with the procedures and acceptance criteria of API Standard 1104.

Note: See 7.7 for length requirements on jointers.

APPENDIX B—REPAIR OF DEFECTS BY WELDING (NORMATIVE)

B.1 Types Of Pipe

B.1.1 SEAMLESS PIPE AND PARENT METAL OF WELDED PIPE

For PSL 1 pipe, the repair of defects in seamless pipe and parent metal of welded pipe is permissible except (a) when the depth of the defect exceeds $33^1/_3$% of the specified wall thickness of the pipe and the length of that portion of the defect in which the depth exceeds $12^1/_2$% is greater than 25% of the specified outside diameter of the pipe; or (b) when more than one repair is required in any length equivalent to 10 times the specified outside diameter of the pipe. Repairs shall be made in accordance with B.2. Repair welds shall be inspected by the magnetic particle method in accordance with 9.7.5.1 through 9.7.5.3; by liquid penetrant; or by other NDT methods as agreed start between purchaser and the manufacturer.

For PSL 2, seamless pipe, the parent metal (body) of welded pipe, plate, and skelp shall not be repaired by welding.

B.1.2 WELD SEAM OF WELDED PIPE

B.1.2.1 Defects in filler metal welds may be repaired at the option of the manufacturer; such repairs shall be in accordance with B.3. All repair welds shall be inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.3, except that the equipment need not be capable of continuous and uninterrupted operation and, at the option of the manufacturer, repairs made by submerged-arc welding or by shielded metal-arc welding may alternatively be inspected by radiological methods in 9.7.3.

B.1.2.2 For PSL 1 pipe, weld seams made without filler metal (electric and laser welds) may be repaired by welding only by agreement between the purchaser and the manufacturer; such repairs shall be in accordance with B.4.

B.1.2.3 For PSL 2 pipe, weld seams made without filler metal shall not be repaired by welding.

B.1.3 HEAT TREATED PIPE

When heat treated pipe has been repaired by welding, the need for and type of reheat treatment shall be based on the effect of the repair on the structure and properties of the heat treated pipe, by agreement between the purchaser and the manufacturer.

B.2 Procedure for Repair by Welding of Seamless Pipe and Parent Metal of Welded Pipe (PSL 1 Only)

The repair of defects in seamless pipe and parent metal of welded pipe shall conform to the requirements listed in B.2.1–B.2.5. Conformance to the repair procedure is subject to approval of the purchaser's inspector.

B.2.1 The defect shall be removed completely by chipping and/or grinding. The resulting cavity shall be thoroughly cleaned and shall be inspected before welding by magnetic particle methods in accordance with 9.7.5 to ensure complete removal of the defect.

B.2.2 The minimum length of repair weld shall be 2 in. (50.8 mm). Where the orientation of the defect permits, the repair weld shall be placed in the circumferential direction.

B.2.3 The repair weld shall be made either by automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The metal temperature in the area to be repaired shall be a minimum of 50°F (10°C). The welding procedure and performance shall be qualified in accordance with Appendix C.

B.2.4 The repair weld shall be ground to merge smoothly into the original contour of the pipe.

B.2.5 Repaired pipe shall be tested hydrostatically after repairing, in accordance with 9.4.

B.3 Procedure for Repair of Submerged-Arc and Gas Metal-Arc Welds

The repair of submerged-arc and gas metal-arc welds shall conform to the requirements listed in B.3.1–B.3.3. Conformance is subject to approval of purchaser's inspector.

B.3.1 The defect shall be completely removed and the cavity thoroughly cleaned. Where multiple pass repairs are used, the size of the cavity shall be sufficiently large [at least 2 in. (50.8 mm) in length] to avoid coincidence of starts and stops of individual passes.

B.3.2 The minimum length of each repair weld shall be 2 in. (50.8 mm). The repair weld shall be made either by automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The welding procedure and performance shall be qualified in accordance with Appendix C.

B.3.3 Each length of repaired pipe shall be tested hydrostatically in accordance with 9.4.

B.4 Procedure for Repair of Electric and Laser Welds (PSL 1 Only)

The repair of electric and laser welds shall conform to the requirements in B.4.1 through B.4.6 and shall include the weld zone, which is defined for the purposes of repair as $^1/_2$ in. (12.7 mm) on each side of the fusion line.

Previous page is blank

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:58 2005

Conformance to the repair procedure is subject to approval of the purchaser's inspector.

B.4.1 The weld zone defect shall be removed completely by chipping and/or grinding, and the resulting cavity shall be thoroughly cleaned.

B.4.2 The minimum length of repair weld shall be 2 in. (50.8 mm), and individual weld repairs shall be separated by at least 10 ft (3 m).

B.4.3 The repair weld shall be made by either automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The metal temperature in the area to be repaired shall be a minimum of 50°F (10°C). The welding procedure and performance shall be qualified in accordance with Appendix C.

B.4.4 When a repair weld is made through the full wall thickness, it shall include weld passes made from both the ID and the OD of the pipe. Starts and stops of the ID and OD repair welds shall not coincide.

B.4.5 The repair shall be ground to merge smoothly into the original contour of the pipe and shall have a maximum crown of 0.06 in. (1.52 mm).

B.4.6 Repaired pipe shall be hydrostatically tested after repair in accordance with 9.4.

APPENDIX C—REPAIR WELDING PROCEDURE (NORMATIVE)

C.1 General

All repair welds shall be made in the flat position according to a qualified procedure and by a welding machine operator (hereafter called operator) or repair welder who is qualified in a flat position as specified in C.2. Repair welds may be made by one of the following methods:

a. Automatic submerged arc.
b. Automatic or semi-automatic gas metal arc.
c. Manual shielded metal arc using low-hydrogen electrodes.

All welding materials shall be properly handled and stored in accordance with the manufacturer's recommendations so as to preclude moisture or other contamination. Test welds may be made on either plate stock or pipe stock at the option of the manufacturer.

The manufacturer shall maintain a record of the welding procedure and procedure qualification test results. Copies of the welding procedure specification and procedure qualification record shall be provided to the purchaser upon request.

C.2 Repair Welding Procedure Qualification

Welding procedures shall be qualified by preparing and testing welds in accordance with this appendix. At the option of the manufacturer, the tests specified in the *ASME Boiler and Pressure Vessel Code*, Section IX, may be substituted herein. For the purpose of this appendix, the term automatic welding includes both machine welding and automatic welding as defined in the *ASME Boiler and Pressure Vessel Code*, Section IX.

C.2.1 ESSENTIAL VARIABLES

An existing procedure shall not be applicable and new procedure shall be qualified when any of the following essential variables is changed beyond the stated limits:

a. Welding process:
   1. A change in the welding process, such as submerged arc to gas metal arc.
   2. A change in the method, such as manual to semi-automatic.
b. Pipe material:
   1. A change in grade category. When different alloying systems are used within one grade category, each alloying composition shall be separately qualified. Grade categories are as follows:
      ≤ X42
      > X42 and < X65
      each grade ≥ X65
   2. Within each grade category, a thicker material than the material qualified.
   3. Within the grade category and thickness range, a carbon equivalent, CE (see note), based on product analysis for the material to be repaired, that is more than 0.04% greater than the CE of the material qualified.

Note:

$$CE = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

c. Welding materials:
   1. A change in filler metal classification.
   2. A change in electrode diameter.
   3. A change of more than 5% in the composition of shielding gas.
   4. A change of more than 10% in the flow rate of shielding gas.
   5. A change in submerged-arc welding flux from one designation to another.
d. Welding parameters:
   1. A change in the type of current (such as AC versus DC).
   2. A change in polarity.
   3. For automatic and semi-automatic welding, schedules of welding current, voltage, and speed may be established to cover ranges of wall thicknesses. Within the schedule, appropriately selected points shall be tested to qualify the entire schedule. Thereafter, a new qualification is required if there is a deviation from the qualified schedule greater than the following:
      10% in amperage
      7% in voltage
      10% in travel speed for automatic welding
e. Weld bead: For manual and semi-automatic welding, a change in bead width greater than 50%.
f. Preheat and post-weld heat treatment:
   1. Repair welding at a pipe temperature lower than the pipe temperature of the qualification test.
   2. The addition or deletion of post-weld heat treatment.

C.2.2 MECHANICAL TESTING

C.2.2.1 Number of Tests

Two specimens of each type are required from each procedure qualification test.

C.2.2.2 Transverse Tensile Test

The transverse tensile test specimens shall be approximately 1.5 in. (38.1 mm) wide and shall have the transverse butt weld perpendicular to the longitudinal axis at the center of the test specimen (See Figure C-1 or Figure 4.) The weld reinforcement shall be removed from both faces. The ultimate

Copyright by the American Petroleum Institute
Wed Feb 02 00:34:59 2005

tensile strength shall be at least equal to the minimum specified for the pipe grade.

C.2.2.3 Transverse Guided-Bend Test

The transverse guided-bend test specimens shall conform to Figure C-2. The weld shall be made in a groove as shown. Each specimen shall be placed on the die with the weld at mid-span and shall be bent approximately 180° in a jig in accordance with Figure C-3 and Table C-1, with the exposed surface of the weld in tension. The bend test shall be considered acceptable if no crack or other defect exceeding $^1/_8$ in. (3.18 mm) in any direction is present in the weld metal or base metal after bending. Cracks that both originate along the edges of the specimen during testing and measure less than $^1/_4$ in. (6.35 mm) in all directions shall not be considered.

C.2.2.4 Nick-Break Test

The nick-break specimens shall conform to Figure C-4. The weld shall be made in a groove as shown. Each specimen shall be saw-notched from both edges at the center of the weld and shall be broken by pulling or hammer blows at the center of one end. The exposed surface of the specimen shall be visually examined and shall be considered acceptable if it meets the following criteria:

a. No gas pockets exceeding $^1/_{16}$ in. (1.59 mm) in any direction.

b. Not more than one gas pocket of any size for specified wall thicknesses of 0.250 in. (6.4 mm) and less.

c. Not more than two gas pockets of any size for specified wall thicknesses of 0.500 in. (12.7 mm) or less but greater than 0.250 in. (6.4 mm).

d. Not more than three gas pockets of any size for specified wall thicknesses greater than 0.500 in. (12.7 mm).

e. Slag inclusions shall be separated by at least $^1/_2$ in. (12.7 mm) of sound metal and shall appear no greater than $^1/_{16}$ in. (1.59 mm) in width or $^3/_{16}$ in. (4.76 mm) in length.

C.3 Welding Personnel Performance Qualification

C.3.1 QUALIFICATION

C.3.1.1 General

Each repair welder and operator is required to qualify. A repair welder or operator qualified on one grade category is qualified for any lower grade category provided the same welding process is used.

C.3.1.2 Testing

To qualify, a repair welder or operator shall produce welds that are acceptable in the following tests:

a. Film radiographic examination per Section 9 of this specification.

b. Two transverse guided-bend tests per C.2.2.3 of this appendix.

c. Two nick-break tests per C.2.2.4 of this appendix.

C.3.1.3 Test Failures

If one or more of the tests in C.3.1.2 fail to meet the specified requirements, the welder or operator may make one additional qualification weld. If that weld fails one or more of the tests in C.3.1.2, the welder or operator is disqualified. No further retests shall be permitted until the welder has completed additional training.

C.3.2 REQUALIFICATION

Requalification in accordance with C.3.1 is required under the following circumstances:

a. One year has elapsed since the last prior applicable qualification.

b. The individual has not been welding using qualified procedures for a period of 3 months.

c. There is reason to question the individual's ability.

Table C-1—Guided-Bend Test Jig Dimensions

(1)	(2)	(3)	(4)	(5)	(6)
	Pipe Grade[a]				
Member Dimension	A, B, & X42	X46	X52 & X56	X60 & X65	X70 & X80
Radius of male member, R_A	$3t$	$3\frac{1}{2}t$	$4t$	$4\frac{1}{2}t$	$5t$
Radius of female member, R_B	$4t + \frac{1}{16}$ in. ($4t$ + 1.6 mm)	$4\frac{1}{2}t + \frac{1}{16}$ in. ($4\frac{1}{2}t$ + 1.6 mm)	$5t + \frac{1}{16}$ in. ($5t$ + 1.6 mm)	$5\frac{1}{2}t + \frac{1}{16}$ in. ($5\frac{1}{2}t$ + 1.6 mm)	$6t + \frac{1}{16}$ in. ($6t$ + 1.6 mm)
Width of male member, A	$6t$	$7t$	$8t$	$9t$	$10t$
Width of groove in female member, B	$8t + \frac{1}{8}$ in. ($8t$ + 3.2 mm)	$9t + \frac{1}{8}$ in. ($9t$ + 3.2 mm)	$10t + \frac{1}{8}$ in. ($10t$ + 3.2 mm)	$11t + \frac{1}{8}$ in. ($11t$ + 3.2 mm)	$12t + \frac{1}{8}$ in. ($12t$ + 3.2 mm)

Notes:

1. See Figure C-3.
2. t = specified wall thickness of the pipe.

[a]For intermediate grades of pipe, the dimensions of the bending jig shall conform to those shown for the next lower grade or shall be proportional thereto.

APPENDIX E—DIMENSIONS, WEIGHTS, AND TEST PRESSURES—SI UNITS (NORMATIVE)

Tables E-6A, E-6B, and E-6C provide the SI unit values for dimensions, weights per unit length, and test pressures, corresponding to the U.S. Customary unit values given in Tables 6A, 6B, and 6C.

Table E-6A—Plain-End Line Pipe Dimensions, Weights per Unit Length, and Test Pressures for Sizes 0.405 Through 1.900 (SI Units)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
						Minimum Test Pressure[b] (kPa × 100)[c]			
						Grade A		Grade B	
Size	Specified Outside Diameter D (mm)	Specified Wall Thickness t (mm)	Plain-End Weight per Unit Length w_{pe} (kg/m)	Calculated Inside Diameter[a] d (mm)	Grade A25	Std.	Alt.	Std.	Alt.
0.405	10.3	1.7	0.36	6.9	48	48	—	48	—
0.405	10.3	2.4	0.47	5.5	59	59	—	59	—
0.540	13.7	2.2	0.62	9.3	48	48	—	48	—
0.540	13.7	3.0	0.79	7.7	59	59	—	59	—
0.675	17.1	2.3	0.84	12.5	48	48	—	48	—
0.675	17.1	3.2	1.10	10.7	59	59	—	59	—
0.840	21.3	2.8	1.28	15.7	48	48	—	48	—
0.840	21.3	3.7	1.61	13.9	59	59	—	59	—

1.660	42.2	9.7	7.77	22.8	96	152	—	158	—
1.900	48.3	3.7	4.07	40.9	69	83	—	90	—
1.900	48.3	5.1	5.43	38.1	90	124	—	131	—
1.900	48.3	10.2	9.58	27.9	96	152	—	158	—

Note: See Table 6A for U.S. Customary unit values corresponding to the SI unit values given in this table.
[a]The calculated inside diameters are given here for information (see 7.2).
[b]The test pressures given in E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.
[c]100 kPa = 1 bar.

Table E-6B (Continued)—Plain-End Line Pipe Dimensions, Weights per Unit Length, and Test Pressures for Sizes $2^3/_8$ through $5^9/_{16}$ (SI Units)

(1)	(2)	(3)	(4)	(5)		(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)	(15)	(16)
	Specified Outside Diameter	Specified Wall Thickness	Plain-End Weight per Unit Length	Calculated Inside Diameter[a]		Minimum Test Pressure[b] (kPa × 100)[c]										
Size	D (mm)	t (mm)	w_{pe} (kg/m)	d (mm)		Grade A25	Grade A	Grade B	Grade X42	Grade X46	Grade X52	Grade X56	Grade X60	Grade X65	Grade X70	Grade X80
$5^9/_{16}$	141.3	19.1	57.56	103.1	Std.	193	193	193	207	207	207	207	207	207	207	207
					Alt.	—	193	193	500	500	500	500	500	500	500	500

Note: See Table 6B for US Customary unit values corresponding to the SI unit values given in this table.

[a]The calculated inside diameters are given here for information (see 7.2).

[b]The test pressures given in Tables E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

[c]100 kPa = 1 bar.

[d]Pipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

Note: See Table 6C for U.S. Customary unit values corresponding to the SI unit values given in this table.

[a]The calculated inside diameters are given here for information (see 7.2).

[b]The test pressures given in Tables E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

[c]100 kPa = 1 bar.

[d]Pipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

APPENDIX F—SUPPLEMENTARY REQUIREMENTS (NORMATIVE)

When specified on the purchase order, the following supplementary requirements (SR) shall apply.

SR3 Color Identification

SR3.1 For Grades X46 and higher of pipe sizes $4^1/_2$ and larger shall be identified by color in accordance with the color code given in SR3.3.

SR3.2 The manufacturer shall apply a 2 in. (50 mm) daub of paint of the appropriate color on the inside surface at one end of each length of pipe.

SR3.3 The grade identification colors are as follows:

Grade	Color
X46	Black
X52	Green
X56	Blue
X60	Red
X65	White
X70	Purple
X80	Yellow

SR4 Nondestructive Inspection of Seamless Line Pipe

SR4.1 SUPPLEMENTARY NONDESTRUCTIVE INSPECTION

Seamless pipe shall be inspected full length for longitudinal defects by either magnetic particle inspection or by ultrasonic or electromagnetic methods. The location of the equipment in the mill shall be at the discretion of the manufacturer; however, the nondestructive inspection shall take place after all heat treating and expansion operations, if performed, but may take place before cropping, beveling, and end sizing.

SR4.2 MAGNETIC PARTICLE INSPECTION

When magnetic particle inspection is employed to inspect for longitudinal defects, the entire outside surface shall be inspected. The depth of all imperfections revealed by magnetic particle inspection shall be determined; and when found to be greater than $12^1/_2$% of the specified wall thickness, the imperfection shall be considered a defect. Pipe containing defects shall be given one of the dispositions specified in 9.7.6.

SR4.3 ULTRASONIC OR ELECTROMAGNETIC INSPECTION

SR4.3.1 Equipment

Any equipment utilizing the ultrasonic or electromagnetic principles and capable of continuous and uninterrupted inspection of the entire outer surface of the pipe may be used. The equipment shall be of sufficient sensitivity to indicate defects and shall be checked as prescribed in SR4.3.2.

SR4.3.2 Reference Standards

At least once per 8 hours per operating shift, a reference standard having the same specified diameter and thickness as the product being inspected shall be used to demonstrate the effectiveness of the inspection equipment and procedures. The reference standard may be of any convenient length as determined by the manufacturer. It shall be scanned by the inspection unit in a manner simulating the inspection of the product. For ultrasonic inspection, the reference standard shall contain a machined notch as specified in Figure F-1. For electromagnetic inspection, the reference standard shall contain either a machined notch as specified in Figure F-1 or a $^1/_8$ in. (3.2 mm) drilled hole (see Note 1). The notch shall be in the outer surface of the reference standard and parallel to the longitudinal axis of the pipe or, at the option of the manufacturer, may be oriented at such an angle as to optimize the detection of anticipated defects (see Note 2). The $^1/_8$ in. (3.2 mm) hole shall be drilled radially through the wall of the reference standard. The inspection equipment shall be adjusted to produce a well-defined indication when the reference standard is scanned by the inspection unit.

Note 1: The reference standards defined above are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.
Note 2: Reference standards other than the specific notch described above may be used by agreement between the purchaser and the manufacturer.

SR4.3.3 Acceptance Limits

Any imperfection that produces a signal greater than the signal received from the reference standard shall be considered a defect unless it can be demonstrated by the manufacturer that the imperfection does not exceed the provisions of 7.8. Pipe containing defects shall be given one of the dispositions specified in 9.7.6.

SR4.4 MARKING

Pipe nondestructively inspected in accordance with this supplementary requirement shall be marked SR4.

SR5 Fracture Toughness Testing (Charpy V-Notch) for Pipe of Size $4^1/_2$ or Larger

SR5.1 The manufacturer is responsible for the performance of Charpy V-notch tests in accordance with ASTM A 370, *Methods and Definitions for Mechanical Testing of*

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:12 2005

Steel Products, as modified herein. Either or both toughness criteria (SR5A—Shear Area or SR5B—Absorbed Energy) may be specified under this supplementary requirement.

SR5.2 The following applies to all specified limits and observed values to be used in connection with this supplementary requirement.

For purposes of determining conformance with these supplementary requirements, an observed value shall be rounded to the nearest whole number in accordance with the rounding-off method of ASTM E 29, *Practice for Using Significant Digits in Test Data to Determine Performance With Specifications*. Further, limiting values as specified or calculated under this supplementary requirement shall be expressed as whole numbers rounded, if necessary.

SR5.3 Except for flattened specimens, the requirements of this supplementary requirement are limited to pipe sizes and wall thicknesses from which a $^1/_2$ size specimen may be secured.

The specimen shall be oriented circumferentially from a location 90° from the weld with the axis of the notch oriented through the pipe wall thickness as shown in Figure F-3.

SR5.4 Except as limited by Item c below, any of the following Charpy V-notch specimens are permissible by agreement between the purchaser and the manufacturer.

a. Full-size specimens. Full-size specimens (10 mm by 10 mm) with or without tapered ends may be used (see note below and Figure F-2).

b. Subsize specimens. The largest possible subsize specimen (see Table F-1) with or without tapered ends may be used. All dimensions other than specimen width are the same as the full-size specimen. Selecting subsize specimens for pipe whose size permits full-size specimens is also permissible by agreement between the purchaser and the manufacturer.

c. Flattened specimens. When because of combinations of diameter and wall thickness the use of $^2/_3$ size tapered end specimens is not practicable (see Table F-1), flattened specimens, $^1/_2$ size conventional specimens, or $^1/_2$ size tapered end specimens shall be used by agreement between the purchaser and the manufacturer. Flattened specimens may be flattened at room temperature in the same manner as transverse tensile strip specimens are prepared. Hot flattening, artificial aging, or heat treatment of flattened specimens is not permitted.

The flattened specimens shall have OD and ID surfaces machined no more than sufficient to make them parallel, or the surfaces shall be wire brushed or cleaned without machining. The specimen width shall essentially represent the full wall thickness of the pipe. All dimensions other than specimen width shall be the same as full-size specimens. The user is cautioned that results of flattened specimens and full-size or subsize specimens may not be correlated or directly compared with one another.

Note: "Tapered end specimens" are designated as "tubular impact specimens containing original OD surface" in ASTM A 370. This terminology is not used here because of possible confusion with the flattened specimens permitted in this SR; flattened specimens may also contain the original OD surface (but not curvature), since machining of flattened specimens is not required by this SR.

SR5.5 If any Charpy V-notch test result for a heat of pipe fails to conform to the applicable requirements of SR5A or SR5B, the manufacturer may elect to heat treat the heat of pipe in accordance with the requirements of 5.4, consider it to be a new heat, test it in accordance with all requirements of 6.2, 9.3, SR5, and SR6 that are applicable to the order item, and proceed in accordance with the applicable requirements of this specification. After one reprocessing heat treatment, any additional reprocessing heat treatment shall be subject to agreement with the purchaser.

For non-heat treated pipe, any reprocessing heat treatment shall be subject to agreement with the purchaser. For heat treated pipe, any reprocessing with a different type of heat treatment (see 5.4) shall be subject to agreement with the purchaser.

SR5A Shear Area

SR5A.1 Three transverse specimens shall be taken from one length of pipe from each heat supplied on the order.

SR5A.2 The specimens shall be tested at 50°F (10°C) or at a lower temperature as specified by the purchaser. The average shear value of the fracture appearance of the three specimens shall not be less than 60%, and the all-heat average for each order per diameter size and grade shall not be less than 80%.

SR5A.3 If the average of the three specimens from one heat does not meet the requirement of 60% shear, the manufacturer may elect to repeat the tests on specimens cut from two additional lengths of pipe from the same heat. If such specimens conform to the specified requirements, all the lengths in the heat shall be accepted except the length initially selected for test. If any of the retest specimens fail to pass this specified retest requirement, the manufacturer may elect to test specimens cut from the individual lengths remaining in the heat.

SR5A.4 The average shear value for a heat shall be the average of the original three specimens if the average is 60% or more; the combined average of the retest specimens, provided the average of each group of three specimens is 60% or more; or, in the event individual lengths are tested, the combined average of all groups of three specimens that meet 60%. The all-heat average value is the combined average of the average shear value for each of the heats supplied for the order item.

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:12 2005

SR5A.5 If the all-heat average of the order does not meet the requirement of 80% shear, the manufacturer shall be responsible for replacement of such heats as may be necessary to bring the average shear area up to 80%.

SR5A.6 Alternatively, the manufacturer may elect to test two or more additional lengths from one or more of the heats. In determining the new heat average, the original test values may be discarded if the pipe length represented is rejected or the three or more individual values are averaged. In any case, the new test values shall be incorporated into the value for the heat.

SR5A.7 Specimens showing material defects or defective preparation, whether observed before or after breaking, may be discarded and replacements shall be considered as original specimens.

SR5A.8 Marking. Pipe tested in accordance with the shear area requirements of this supplementary requirement shall be marked to indicate the type of test, the test temperature, and if flattened specimens are used, the type of specimen. Temperatures below zero shall be preceded by the letter M.

Example at + 32°F:	SR5A-32F
Example of flattened specimen at – 40°C:	SR5AF-M40C

SR5B Absorbed Energy

SR5B.1 The fracture toughness of the pipe shall be determined using Charpy V-notch impact test specimens in accordance with ASTM A 370, as modified herein, and the requirements of SR5A.1, except that test frequency shall be as indicated in SR5B.2. The purchaser shall specify, in whole numbers, both the test temperature and the minimum average absorbed energy for full-size specimens.

Specimens used for shear area determination according to SR5A may be additionally used for the determination of absorbed energy.

SR5B.2 Three transverse specimens representing one test shall be taken from one length of pipe from each inspection lot of 100 lengths per heat produced. An inspection lot shall consist of pipe that is made to the same size and same specified wall thickness by the same process and under the same manufacturing conditions.

SR5B.3 For acceptance, the average absorbed energy of the three individual specimens from a length shall not be less than the full-size value specified by the purchaser. In addition, the lowest individual reading of the three specimens shall not be less than 75% of the specified value. When subsize specimens are used, the individual readings and the average of the three readings are divided by the ratio of the specimen thickness tested to the full-size specimen thickness and compared with the full-size acceptance criteria. When flattened specimens are used, each of the three individual impact energy readings shall be multiplied by 0.3937 (10), and divided by the actual measured specimen width, in inches (millimeters). These results, and the average of the three results, shall meet the specified absorbed energy acceptance criteria for full-size specimens.

SR5B.4 Specimens showing material defects or defective preparations, whether observed before or after breaking, may be discarded and replacements shall be considered original specimens.

In the event a set of test specimens fails to meet the acceptance criteria, the manufacturer may elect to replace the lot of material involved or alternatively to test two more lengths from the same lot. If both of the new tests meet the acceptance criteria, then all pipe in that lot with the exception of the original selected length shall be considered to meet the requirement. Failure of either of the two additional tests shall require testing of each length in the lot for acceptance.

SR5B.5 Pipe complying with the absorbed energy requirements of this supplementary requirement shall be marked to indicate the type of test, the specified [full-size] minimum average absorbed energy, the test temperature, and, if flattened specimens are used, the type of specimen. Temperatures below zero shall be preceded by the letter M, and absorbed energy specified in joules shall be followed by the letter J.

Example for 20 ft-lb at +32°F:	SR5B-20-32F
Example of flattened specimens for 20 ft-lb at – 40°F:	SR5BF-20-M40F
Example of flattened specimens for both SR5A and SR5B for 27 joules at 0°C:	SR5ABF-27J-0C

SR6 Drop-Weight Tear Testing on Welded Pipe of Size 20 or Larger, Grade X52 or Higher

SR6.1 Fracture toughness of pipe sizes 20 and larger, Grade X52 and higher, shall be determined by the manufacturer using drop-weight tear tests in accordance with the following requirements in SR6.2 through SR6.8.

SR6.2 Two transverse specimens shall be taken from one length of pipe from each heat supplied on the order. The specimens shall be oriented circumferentially from a location 90° from the weld with the axis of the notch oriented through the pipe wall thickness as shown in Figure F-3. The specimens shall be tested at 50°F (10°C) or at a lower temperature as specified by the purchaser.

SR6.3 The test specimens, testing procedure, and rating of the specimens shall be in accordance with API Recommended Practice 5L3. The type of notch (pressed or chevron) shall be selected by agreement between the manufacturer and the purchaser.

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:12 2005

SR6.4 At least 80% of the heats shall exhibit a fracture appearance shear area of 40% or more for the specified test temperature (see note).

Note: Due to manufacturing difficulties encountered with thicker materials, pipe manufacturers may not be able to offer pipe in all grades that meet this requirement.

SR6.5 In the event the average value of the two specimens from the length selected to represent the heat is less than 40%, the manufacturer may elect to establish the heat average by testing two specimens from each of two or more additional lengths of pipe in the heat. In establishing the new heat average, the manufacturer may elect (a) to employ the combined average of the three tests or more; or (b) to discard the result of the first test, reject the pipe from which it was taken, and employ the combined average of the two or more additional tests. Alternatively, the manufacturer may elect to test all the pipe in the heat, in which case 80% or more of the lengths tested and applied to the order shall exhibit an average of 40% or more shear.

SR6.6 Specimens showing material defects or defective preparation, whether observed before or after breaking, may be discarded, and replacements shall be considered as original specimens.

SR6.7 The manufacturer shall be responsible for replacement of such heats as may be necessary to meet the above requirements.

SR6.8 Pipe tested in accordance with SR6 shall be marked to indicate the type of test, the type of notch, and the testing temperature. Temperatures below zero shall be preceded by the letter M.

Example for chevron notch at 32°F: SR6C-32F
Example for pressed notch at – 10°C: SR6P-M10C

SR7 Through-the-Flowline (TFL) Pipe

SR7.1 GENERAL

TFL pipe shall comply with all requirements of this specification and the additional requirements specified in SR7.2 through SR7.6.

SR7.2 DIMENSION AND GRADES

TFL pipe shall be seamless or longitudinal seam pipe in the outside diameters, wall thicknesses, and grades listed in Table F-2.

SR7.3 LENGTH

Unless otherwise specified, TFL pipe shall be furnished only in double random lengths with no jointers (girth welds).

SR7.4 DRIFT TESTS

Each length of TFL pipe shall be tested throughout its entire length with a cylindrical drift mandrel conforming to the requirements listed below. The leading edge of the drift mandrel shall be rounded to permit easy entry into the pipe. The drift mandrel shall pass freely through the pipe with a reasonable exerted force equivalent to the weight of the mandrel being used for the test. Pipe shall not be rejected until it has been drift tested when it is free of all foreign matter and properly supported to prevent sagging.

	Drift Mandrel Size			
	Length		Diam., min.	
Size	in.	mm	in.	mm
$< 3^1/_2$	42	1066	d – $^3/_{32}$	d – 2.4
$\geq 3^1/_2$	42	1066	d – $^1/_8$	d – 3.2

SR7.5 HYDROSTATIC TESTS

TFL pipe shall be hydrostatically tested in accordance with the requirements of 9.4, except that the minimum test pressures shall be as shown in Table F-2. These test pressures in Table F-2 represent the lesser of 10,000 psi (68 900 kPa) and the pressure calculated with the equation given in 9.4.3, using a fiber stress (S) equal to 80 percent of the specified minimum yield strength.

SR7.6 MARKING

TFL pipe manufactured in accordance with SR7 shall be marked with the letters TFL in addition to the marking required in Section 10 or Appendix I.

SR15 Test Certificates and Traceability for Line Pipe

SR15.1 The manufacturer shall provide the following data, as applicable, for each order item for which this supplementary requirement is specified on the purchase order. The manufacturer's certificate of compliance shall state the API specification and date of revision to which pipe was manufactured. A Material Test Report, Certificate of Compliance, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the manufacturer's facility. The content of the EDI transmitted document must meet the requirements of this specification and conform to any existing EDI agreement between the purchaser and the manufacturer.

a. Specified outside diameter, specified wall thickness, grade, process of manufacture, and type of heat treatment.

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:13 2005

b. Chemical analyses (heat, product, control, and recheck) showing the weight percent of all elements whose limits or reporting requirements are set in this specification; for PSL 2 pipe, carbon equivalent and applicable maximum allowable value. If order is for by-agreement "high carbon equivalent pipe," that designation shall be included.

c. Test data for all tensile tests required by this specification, including yield strength, ultimate tensile strength, and elongation. The type, size, and orientation of specimens shall be shown.

d. Fracture toughness test results (including test type and criteria and the size, location, and orientation of the specimen) where such testing is required.

e. Minimum hydrostatic test pressure and duration.

f. For welded pipe for which nondestructive inspection of the weld seam is required by this specification, the method of nondestructive inspection employed (radiological, ultrasonic, electromagnetic, and/or magnetic particle), and the type and size of all penetrameters and reference standards used.

g. For seamless pipe for which nondestructive inspection (SR4) is required, the method of inspection employed (ultrasonic, electromagnetic, or magnetic particle) and the type and size of the reference standard used.

h. For electric welded pipe and laser welded pipe, the minimum temperature for heat treatment of the weld seam. Where such heat treatment is not performed, the words "No Seam Heat Treatment" shall be stated on the certificate.

i. Results of any supplemental testing required by the purchaser.

SR15.2 The manufacturer shall establish and follow procedures for maintaining heat and lot identity of all pipe covered by this supplementary requirement. The procedures shall provide means for tracing any length of pipe or coupling to the proper heat and lot and to all applicable chemical and mechanical test results.

SR17 Nondestructive Inspection of Welds in Electric Welded Pipe and Laser Welded Pipe

SR17.1 SUPPLEMENTARY NONDESTRUCTIVE INSPECTION

The weld in electric welded pipe shall be inspected full length for surface and subsurface defects by either ultrasonic or electromagnetic methods. The weld in laser-welded pipe shall be inspected full length for surface and subsurface defects by ultrasonic methods. The location of the equipment in the mill shall be at the discretion of the manufacturer. However, the nondestructive inspection shall take place after all heat treating, hydrostatic testing, expansion, and rotary straightening operations, if performed, but may take place before cropping, beveling, and sizing of pipe.

SR17.2 EQUIPMENT AND REFERENCE STANDARDS

The ultrasonic or electromagnetic inspection equipment requirements are given in 9.7.4.1, and the reference standards are described in 9.7.4.2. Details of the specific techniques (such as method, reference standards, transducer properties, and sensitivity) shall be agreed upon between the purchaser and the manufacturer for the implementation of this supplementary requirement.

SR17.3 ACCEPTANCE LIMITS AND EMI INSPECTIONS

Table 21 gives the height of acceptance limit signals in percent of height of signals produced by reference standards. An imperfection that produced a signal greater than the acceptance limit signal given in Table 21 shall be classified as a defect.

SR17.4 DISPOSITION

Defects shall be disposed of in accordance with 9.7.6, Items a, c, and d. Repair by welding is not permitted. If a defect is removed by grinding, the ground area shall be reinspected by the same method originally used.

SR17.5 MARKING

Pipe nondestructively inspected in accordance with this supplementary requirement shall be marked SR17.

SR18 Carbon Equivalent

SR18.1 For pipe grades up to Grade X70 inclusive, the carbon equivalent, CE, calculated using product analysis and the following equation shall not exceed 0.43%:

$$CE = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

SR18.2 The elements analyzed for product analysis shall include all elements contained in the carbon equivalent equation.

SR19 Additional Fracture Toughness Requirements (Transverse Charpy V-Notch) for PSL 2 Pipe

SR19.1 Except as allowed by SR19.2, fracture toughness testing shall be performed in accordance with the requirements of 9.3.5.1 and 9.3.5.2, with a test temperature of 32°F (0°C) or a lower temperature as specified on the purchase order. The required minimum all-heat average full-size absorbed energy value shall be the greater of

a. 30 ft-lb (40 J) for grades below Grade X80, 60 ft-lb (80 J) for Grade X80 pipe; and

b. The value obtained from the following equation, using a stress factor (F) of 0.72 or a higher value if specified on the purchase order, and rounding the calculated value to the nearest foot-pound (joule):

U.S. Customary Unit Equation

$$CV = 0.0345(F\sigma_y)^{\frac{3}{2}}\left(\frac{D}{2}\right)^{\frac{1}{2}}$$

SI Unit Equation

$$CV = 0.000512(F\sigma_y)^{\frac{3}{2}}\left(\frac{D}{2}\right)^{\frac{1}{2}}$$

where

CV = minimum all-heat average full-size Charpy V-notch absorbed energy requirement, ft-lb (J),

F = stress factor,

σ_y = specified minimum yield strength, ksi (MPa),

D = specified outside diameter, in. (mm).

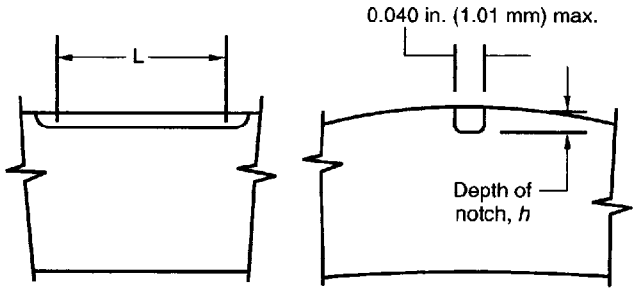
Notes:

1. See Table F-3 for the required minimum all heat-average absorbed energy values for pipe having a standard size and grade, and a stress factor of 0.72.
2. The above equation is one of a number of such relationships derived from full-scale burst test data for a limited number of sizes and grades (see ASME B31.8). It is also judged to be conservative for initiation conditions in pipelines.

SR19.2 Pipe tested at a lower temperature than is required in SR19.1 shall be acceptable if it meets the required absorbed energy values.

SR19.3 Pipe tested in accordance with SR19 shall be marked to indicate the specified (full-size) minimum all-heat average absorbed energy value and the specified test temperature. Temperatures below zero shall be preceded by the letter M, and the absorbed energy specified in joules shall be followed by the letter J.

Example for 30 ft-lb at + 32°F:	SR19-30-32F
Example for 70 J at – 5°C:	SR19-70J-M5C



Depth of notch, h, shall be 12½% of the nominal wall thickness of the pipe being inspected, but not less than 0.012 in. (0.30 mm).

For ultrasonic and eddy current the length of notch at full depth, *L*, shall be at least twice the width of the scanning head.

For diverted flux the length of notch shall be as required by the equipment design to provide a reproducible signal when the reference standard is passed through the equipment at the inspection line speed for the pipe being inspected. Three passes through the equipment shall be required to ensure reproducibility.

APPENDIX H—PURCHASER INSPECTION (NORMATIVE)

H.1 Inspection Notice

Where the inspector representing the purchaser desires to inspect pipe or witness tests, reasonable notice shall be given of the time at which the run is to be made.

H.2 Plant Access

The inspector representing the purchaser shall have unrestricted access, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that will concern the manufacture of the pipe ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the pipe is being manufactured in accordance with this specification. All inspections should be made at the place of manufacture prior to shipment, unless otherwise specified on the purchase order, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

H.3 Compliance

The manufacturer is responsible for complying with all of the provisions of this specification. The purchaser may make any investigation necessary to satisfy himself of compliance by the manufacturer and may reject any material that does not comply with this specification.

H.4 Rejection

Unless otherwise provided, material that shows defects on inspection or subsequent to acceptance at the manufacturer's works, or material that proves defective when properly applied in service, may be rejected and the manufacturer so notified. If tests that require the destruction of material are made, any product proven not to have met the requirements of the specification shall be rejected. Disposition of rejected product shall be a matter of agreement between the manufacturer and the purchaser.

APPENDIX I—MARKING INSTRUCTIONS FOR API LICENSEES (NORMATIVE)

I.1 General

The marking requirements in this appendix apply to licensed manufacturers using the API monogram on products covered by this specification.

Pipe and pipe couplings manufactured in conformance with this specification may be marked by the licensee as specified in Appendix I or Section 10. Products to which the monogram is applied shall be marked as specified in Appendix I.

I.1.1 The required marking on pipe shall be as stipulated hereinafter.

I.1.2 The required marking on couplings shall be die stamped unless otherwise agreed between the purchaser and the manufacturer, in which case they shall be paint stenciled.

I.1.3 Additional markings, including those for compatible standards following the specification marking, are allowed and may be applied as desired by the manufacturer or as requested by the purchaser.

I.2 Location of Markings

The location of identification markings shall be as specified in I2.1 – I2.3.

I.2.1 SIZES 1.900 AND SMALLER

The marking is die stamped on a metal tag fixed to the bundle, or may be printed on the straps or banding clips used to tie the bundle.

I.2.2 SEAMLESS PIPE IN ALL OTHER SIZES AND WELDED PIPE SMALLER THAN SIZE 16

Paint stencil on the outside surface starting at a point between 18 in. and 30 in. (460 and 760 mm) from the end of the pipe, and in the sequence shown in I.3, except when agreed between the purchaser and the manufacturer, some or all of the markings may be placed on the inside surface in a sequence convenient to the manufacturer.

I.2.3 WELDED PIPE SIZES 16 AND LARGER

Paint stencil on the inside surface starting at a point no less than 6 in. from the end of the pipe in a sequence convenient to the manufacturer, unless otherwise specified by the purchaser.

I.3 Sequence of Markings

The sequence of identification markings shall be as specified in I.3.1 – I.3.10.

I.3.1 MANUFACTURER'S API LICENSE NUMBER

The manufacturer's API license number shall be marked. (The manufacturer's name or mark is optional.)

I.3.2 API MONOGRAM ([MONOGRAM]) AND DATE

The API monogram ( ), immediately followed by the date of manufacture (defined as the month and year when the monogram is applied), shall be applied only to products complying with the requirements of the specification and only by authorized manufacturers.

I.3.3 COMPATIBLE STANDARDS

Products in compliance with multiple compatible standards may be marked with the name of each standard.

I.3.4 SPECIFIED DIMENSIONS

The specified outside diameter and the specified wall thickness shall be marked, except that, for the specified outside diameter, any ending zero digits to the right of the decimal need not be included in such markings.

I.3.5 GRADE AND CLASS

The symbols to be used are as follows:

Grade (see Note)	Symbol
Grade A25-Class I	A25
Grade A25-Class II	A25R
Grade A	A
Grade B	B
Grade X42	X42
Grade X46	X46
Grade X52	X52
Grade X56	X56
Grade X60	X60
Grade X65	X65
Grade X70	X70
Grade X80	X80

Note: See 1.3 for limitations on down-grading.

For grades intermediate to X42 and X80, the symbol shall be X followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

By agreement between the purchaser and the manufacturer and when so specified on the purchase order, the grade shall be identified by color in accordance with SR3.

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:19 2005

I.3.6 PRODUCT SPECIFICATION LEVEL

The symbols to be used are as follows:

a. PSL 1	PSL1
b. PSL 2	PSL2

The PSL marking shall be placed immediately after the grade symbol.

I.3.7 PROCESS OF MANUFACTURE

The symbols to be used are as follows:

a. Seamless pipe	S
b. Welded pipe, except continuous welded and laser welded	E
c. Continuous welded pipe	F
d. Laser welded pipe	L

I.3.8 HEAT TREATMENT

The symbols to be used are as follows:

a. Normalized or normalized and tempered	HN
b. Subcritical stress relieved	HS
c. Subcritical age hardened	HA
d. Quench and Tempered	HQ

I.3.9 TEST PRESSURE

When the specified hydrostatic test pressure is higher than the tabulated standard pressure (Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable), the word "TESTED" shall be marked, immediately followed by the specified test pressure (in pounds per square inch for pipe ordered in U.S. Customary units, or in hundreds of kilopascals for pipe ordered in SI units).

I.3.10 SUPPLEMENTARY REQUIREMENTS

See Appendix F for supplementary requirements.

I.3.11 EXAMPLES

a. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade B, PSL 2, seamless, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 14 0.375 B PSL2 S

or

5LXXXX.X API (MO-YR) 355.6 9.5 B PSL2 S

b. Size $6^5/_8$, 0.280 in. (7.1 mm) specified wall thickness, Grade B, PSL 1, electric welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 6.625 0.280 B PSL1 E

or

5LXXXX.X API (MO-YR) 168.3 7.1 B PSL1 E

c. Size $4^1/_2$, 0.237 in. (6.0 mm) specified wall thickness, Grade A25, Class I, continuous welded, threaded-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 4.5 0.237 A25 PSL1 F

or

5LXXXX.X API (MO-YR) 114.3 6.0 A25 PSL1 F

d. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade X70, PSL 2, seamless, quenched and tempered, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 14 0.375 X70 PSL2 S HQ

or

5LXXXX.X API (MO-YR) 355.6 9.5 X70 PSL2 S HQ

e. Size $12^3/_4$, 0.330 in. (8.4 mm) specified wall thickness, Grade X42, PSL 1, seamless plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 12.75 0.330 X42 PSL1 S

or

5LXXXX.X API (MO-YR) 323.9 8.4 X42 PSL1 S

f. Size $6^5/_8$, 0.216 in. (5.5 mm) specified wall thickness, Grade X42, PSL 1, laser welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X API (MO-YR) 6.625 0.216 X42 PSL1 L

or

5LXXXX.X API (MO-YR) 168.3 5.5 X42 PSL1 L

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:19 2005

g. Size 24, 0.406 in. (10.3 mm) specified wall thickness, Grade X42, PSL 2 helical seam submerged-arc welded plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X ⟨API⟩ (MO-YR) 24 0.406 X42 PSL2 E

or

5LXXXX.X ⟨API⟩ (MO-YR) 610 10.3 X42 PSL2 E

I.4 Bundle Identification

For pipe of size 1.900 or smaller, the identification markings specified in I.3 shall be placed on the tag, strap, or clip used to tie the bundle. For example, size 1.900, 0.145 in. (3.7 mm) specified wall thickness, Grade B, electric welded, plain-end pipe should be marked as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X ⟨API⟩ (MO-YR) 1.9 0.145 B PSL1 E

or

5LXXXX.X ⟨API⟩ (MO-YR) 48.3 3.7 B PSL1 E

I.5 Length

In addition to the identification markings stipulated in I.2, I0.3, and I0.4, the length shall be marked as follows, using feet and tenths of a foot for pipe ordered in U.S. Customary units, or meters to two decimal places for pipe ordered in SI units, unless a different measuring and marking format has been agreed upon by the purchaser and manufacturer:

a. For pipe larger than size 1.900, the length, as measured on the finished pipe, shall be paint stenciled on the outside surface at a location convenient to the manufacturer, or by agreement between the purchaser and the manufacturer, on the inside surface at a convenient location.
b. For pipe of size 1.900 or smaller, the total length of pipe in the bundle shall be marked on the tag, band, or clip.

I.6 Couplings

All couplings in sizes $2^3/_8$ and larger shall be identified with the manufacturer's name or mark and the API monogram (⟨API⟩), immediately followed by the date of manufacture (defined as the month and year when the monogram is applied).

I.7 Die Stamping

Cold die stamping of grades higher than A25 plate or pipe not subsequently heat treated and all pipe with wall thickness of 0.156 in. (4.0 mm) and less is prohibited, except that by agreement between the purchaser and the manufacturer and when so specified on the purchase order, pipe or plate may be cold die stamped. The manufacturer at his option may hot die stamp [200°F (93°C) or higher] plate or pipe, cold die stamp plate or pipe if it is subsequently heat treated, and cold die stamp couplings. Cold die stamping shall be done with rounded or blunt dies. All die stamping shall be at least 1 in. (25 mm) from the weld for all grades except Grade A25.

I.8 Thread Identification

At the manufacturer's option, threaded-end pipe may be identified by stamping or stenciling the pipe adjacent to the threaded ends, with the threader's API license number, the API monogram (⟨API⟩), immediately followed by the date of threading (defined as the month and year the monogram is applied), the specified outside diameter of the pipe, and LP to indicate the type of thread. The thread marking may be applied to products that do or do not bear the API monogram. For example, size $6^5/_8$ threaded-end pipe may be marked as follows, using the value that is appropriate for the pipe outside diameter specified on the purchase order:

5LXXXX.X ⟨API⟩ (MO-YR of threading) 6.625 LP

or

5LXXXX.X ⟨API⟩ (MO-YR of threading) 168.3 LP

If the product is clearly marked elsewhere with the manufacturer's identification, his license number, as above, may be omitted.

I.9 Thread Certification

The use of the monogram (⟨API⟩) as provided in I.8 shall constitute a certification by the manufacturer that the threads so marked comply with the requirements stipulated in the latest edition of API Standard 5B but should not be construed by the purchaser as a representation that the product so marked is, in its entirety, in accordance with any API specification. Manufacturers who use the monogram (⟨API⟩) for thread identification are required to have access to properly certified API reference master pipe gages.

I.10 Pipe Processor Markings

Pipe heat treated by a processor other than the original pipe manufacturer shall be marked as stipulated in I.1 through I.7. The processor shall remove any identification that is not indicative of a new condition of the product as a result of heat treating (such as, prior grade and original pipe manufacturer's name or logo).

APPENDIX J—SUMMARY OF DIFFERENCES BETWEEN PSL 1 AND PSL 2 (INFORMATIVE)

Parameter	PSL 1	PSL 2	Reference
Grade range	A25 through X70	B through X80	Table 1
Size range	0.405 through 80	$4^1/_2$ through 80	Table 1
Type of Pipe Ends	Plain-end, threaded-end; belled-end; special coupling pipe	Plain-end	Table 1
Seam welding	All methods; continuous welding limited to Grade A25	All methods except continuous and laser welding	Table 1
Electric welds: welder frequency	No minimum	100 kHz minimum	5.1.3.3.2
Heat treatment of electric welds	Required for grades > X42	Required for all grades (B through X80)	5.1.3.3.1; 5.1.3.3.2; 6.2.7
Chemistry: max C for seamless pipe	0.28% for grades ≥ B	0.24%	Tables 2A, 2B
Chemistry: max C for welded pipe	0.26% for grades ≥ B	0.22%	Tables 2A, 2B
Chemistry: max P	0.030% for grades ≥ A	0.025%	Tables 2A, 2B
Chemistry: max S	0.030%	0.015%	Tables 2A, 2B
Carbon Equivalent:	Only when purchaser specifies SR18	Maximum required for each grade	4.2; 4.3; 6.1.3; SR15.1
Yield Strength, Maximum	None	Maximum for each grade	Tables 3A, 3B
UTS, Maximum	None	Maximum for each grade	Tables 3A, 3B
Fracture Toughness	None required	Required for all grades	6.2.6; 9.3.5; 9.8.4; 9.10.7; Table 14
Nondestructive inspection of seamless	Only when purchaser specifies SR4	SR4 mandatory	9.7.2.6
Repair by welding of pipe body, plate, and skelp	Permitted	Prohibited	5.3.2; 9.7.6; B.1; B.2
Repair by welding of weld seams without filler metal	Permitted by agreement	Prohibited	4.3; 9.7.4.4; 9.7.6; B.1.2; B.4
Certification	Certificates when specified per SR15	Certificates (SR15.1) mandatory	12.1
Traceability	Traceable only until all tests are passed, unless SR 15 is specified	Traceable after completion of tests (SR15.2) mandatory	5.6

APPENDIX K—END LOAD COMPENSATION FOR HYDROSTATIC TEST PRESSURES IN EXCESS OF 90% OF SPECIFIED MINIMUM YIELD STRENGTH (NORMATIVE)

(By agreement between the purchaser and the manufacturer, the following method may be used to determine the hydrostatic test pressure.)

K.1 As a measure to prevent distortion when testing at pressures equivalent to stresses in excess of 90% of specified minimum yield strength, the manufacturer may apply a calculation to compensate for the forces applied to the pipe end that produce a compressive longitudinal stress. The calculation in this appendix is based on Barlow's equation (see 9.4.3) modified by a factor based on the Maximum Shear Theory (see note). The calculation may be applied only when testing in excess of 90% of the specified minimum yield strength. In no case may the gage pressure for testing be less than that calculated using Barlow's equation at 90% of specified minimum yield strength.

Note: The calculation is an approximation of the effective hoop stress (SE), which is practical for application under mill pipe testing conditions. Other calculations provide closer approximations of effective hoop stress but are complex and therefore impractical for application.

K.2 The test pressure calculated shall be rounded to the nearest 10 psi (100 kPa).

K.3 The hydrostatic test pressure compensated for pipe end loading shall be calculated according to the following equation:

U.S. Customary Unit Equation:

$$P_1 = \frac{S_E - \frac{P_R A_R}{A_p}}{\frac{D}{2t} - \frac{A_1}{A_p}}$$

SI Unit Equation:

$$P_1 = 1000\frac{S_E - \frac{P_R A_R}{A_p}}{\frac{D}{2t} - \frac{A_1}{A_p}}$$

where

A_1 = internal cross-sectional area of pipe,

A_P = cross-sectional area of pipe wall,

A_R = cross-sectional area of ram,

P_1 = hydrostatic test pressure in psi (kPa),

P_R = internal pressure on end-sealing ram,

S_E = effective hoop stress in psi (MPa) equal to a percentage of the specified minimum yield strength,

D = specified outside diameter, in. (mm),

t = specified wall thickness, in. (mm).

K.4 The above equation may be manipulated algebraically to provide calculation in other terms appropriate to the manufacturer's testing facility.

K.5 Appropriate techniques for the control of effective hoop stress based on measurements of internal pipe and ram pressures vary according to hydrotester system design. The manufacturer shall provide a control technique appropriate to his installation.

APPENDIX M—CONVERSION PROCEDURES

The following procedures were used to make the soft metric conversions of U.S. Customary units to SI units in the metric conversion of API Spec 5L.

M.1 Fractions

Fractions and numbers with fractions in U.S. Customary units were converted to the full decimal equivalent in U.S. Customary units without rounding, and the full decimal equivalents in U.S. Customary units were then converted to SI values using the following formula:

$$N_m = 25.4 \bullet N$$

where

N_m = the SI equivalent of dimensions with fractions in U.S. Customary units, mm,

N = the full decimal equivalent of dimensions with fractions without rounding, in.

The SI equivalents of dimensions with fractions in U.S. Customary units were then rounded to the appropriate number of places in mm.

M.2 Outside Diameter

The U.S. Customary values for outside diameters of pipe and couplings were converted to SI values using the following formula:

$$D_m = 25.4 \bullet D$$

where

D_m = SI outside diameter, mm,

D = outside diameter, in.

The SI outside diameters of pipe and couplings smaller than size 18 were rounded to the nearest 0.1 mm. The SI outside diameters of pipe and couplings size 18 and larger were rounded to the nearest 1.0 mm.

M.3 Wall Thickness

The U.S. Customary values for wall thickness were converted to SI values using the following formula:

$$t_m = 25.4 \bullet t$$

where

t_m = SI wall thickness, mm,

t = wall thickness, in.

The SI wall thicknesses were rounded to the nearest 0.1 mm.

M.4 Inside Diameter

The SI inside diameters of pipe were calculated (not converted) using the following formula:

$$d_m = D_m - 2 \bullet t_m$$

where

d_m = SI inside diameter, mm,

D_m = SI outside diameter, mm,

t_m = SI wall thickness, mm.

The SI inside diameters were rounded to the nearest 0.1 mm.

M.5 Plain End Linear Density

The SI plain end linear densities were calculated (not converted) using the following formula:

$$W_{pem} = 0.0246615(D_m - t_m)t_m$$

where

W_{pem} = SI plain end linear density, kg/m,

D_m = SI outside diameter, mm,

t_m = SI wall thickness, mm.

The SI plain end linear densities are rounded to the nearest 0.01 kg/m.

M.6 Yield Strength and Tensile Strength

The U.S. Customary values for yield strength and tensile strength were converted to SI values using the following formula:

$$ys_m = 0.00689476 \bullet ys$$

$$ts_m = 0.00689476 \bullet ts$$

where

ys_m = SI yield strength, MPa,

y_s = yield strength, psi,

ts_m = SI tensile strength, MPa,

t_s = tensile strength, psi.

The converted SI strengths were rounded to the nearest 1 MPa.

Previous page is blank

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:21 2005

M.7 Hydrostatic Test Pressure

The U.S. Customary values for hydrostatic test pressures for all sizes of threaded pipe, all Grade A25 plain-end pipe smaller than size $5^9/_{16}$, and all Grade A and Grade B plain-end pipe smaller than size $2^3/_8$ were converted to SI values using the following formula:

$$P_m = 0.00689476 \bullet P$$

The converted hydrostatic test pressures were rounded to the nearest 100 kPa.

The SI hydrostatic test pressures for plain-end size $5^9/_{16}$, Grade A25 and for sizes $2^3/_8$ and larger Grades A and higher were calculated (not converted) using the following formula:

$$P_m = 2{,}000 \bullet f \bullet ys_m \bullet t_m / D_m$$

where

P_m = SI hydrostatic test pressure, kPa,

P = hydrostatic test pressure, psi,

f = stress factor, see table below,

ys_m = SI yield strength, MPa,

t_m = SI wall thickness, mm,

D_m = SI outside diameter, mm.

The calculated hydrostatic test pressure were rounded to the nearest 100 kPa, not to exceed 17 200 kPa for sizes $3^1/_2$ and smaller or 19 300 kPa for sizes larger than $3^1/_2$.

The calculated standard hydrostatic test pressures for Grades X42 and higher were rounded to the nearest 100 kPa, not to exceed 20 700 kPa. The calculated alternative hydrostatic test pressure for Grades X42 and higher were rounded to the nearest 100 kPa, not to exceed 50 000 kPa for sizes smaller than 16, or 25 000 kPa for sizes 16 and larger.

		f Factor	
Grade	Size	Standard Test Pressure	Alternative Test Pressure
A25	$5^9/_{16}$	0.60	—
A & B	$\geq 2^3/_8$	0.60	0.75
X42 & higher	$\leq 5^9/_{16}$	0.60	0.75
	$> 5^9/_{16}$ and $\leq 8^5/_8$	0.75	0.75
	$> 8^5/_8$ and < 20	0.85	0.85
	≥ 20	0.90	0.90

M.8 Temperature

The U.S. Customary values for temperatures were converted to SI values using the following formula:

$$°C = {}^5/_9 (°F - 32)$$

where

°C = SI temperature, degrees Celsius,

°F = temperature, degrees Fahrenheit.

The SI temperatures were rounded to the nearest 1°C.

M.9 Charpy Impact Energy

The U.S. Customary values for impact energy were converted to SI values using the following formula:

$$E_m = 1.35582 \bullet E$$

where

E_m = Energy, J,

E = Energy, ft-lb.

The SI energy values were rounded to the nearest 1 J.

M.10 Minimum Length of Couplings

The U.S. Customary values for the minimum lengths of couplings in inches and fractions were converted to full decimal equivalents in U.S. Customary units without rounding, and then the full decimal equivalents were converted to SI values using the following formula:

$$N_{Lm} = 25.4 \bullet N_L$$

where

N_{Lm} = SI minimum length of couplings, mm,

N_L = the full decimal equivalent, without rounding, of the minimum lengths of couplings, in.

The SI minimum lengths of coupling were rounded to the nearest 0.01 mm.

M.11 Diameter of Coupling Recess

The U.S. Customary values for diameters of the coupling recess's were converted to SI values using the following formula:

$$Q_m = 25.4 \bullet Q$$

where

Q_m = SI diameter of the coupling recess, mm,

Q = diameter of the coupling recess, in.

The SI diameter of the couplings recesses were rounded to the nearest 0.01 mm.

Copyright by the American Petroleum Institute
Wed Feb 02 00:35:21 2005

M.12 Width of the Coupling Bearing Face

The U.S. Customary values for widths of the bearing face of couplings were converted to SI values using the following formula:

$$b_m = 25.4 \bullet b$$

where

b_m = SI width of the coupling bearing face, mm,

b = width of the coupling bearing face, in.

The SI width of the coupling bearing face were rounded to the nearest 0.1 mm.

M.13 Coupling Weights

The U.S. Customary values for calculated coupling weights were converted to SI values using the following formula:

$$W_m = 0.4535924 \bullet w$$

where

W_m = SI calculated coupling weight, kg,

w = calculated coupling weight, lb.

The SI calculated coupling weights were rounded to the nearest 0.01 kg.

SUGGESTIONS FOR ORDERING API FIBERGLASS LINE PIPE

In placing orders for line pipe to be manufactured in accordance with API Spec 15LR the purchaser may specify the following on the purchase order:

Specification	API Spec 15LR
Quantity	
Pressure Rating	Par. 1.1
Physical Properties	Par. 4.1
Process of Manufacture	Par. 2.1
Resin System	Par. 2.2
Nominal Size or Outside Diameter	Table 6.1
Length	Par. 6.2
Pipe Ends	Par. 7.1
Mill Inspection by Purchaser	Par. 9.1, 9.2
Delivery Date and Shipping Instructions	

Attention is called to the following paragraphs which may require additional discussion or agreement between the purchaser and the manufacturer.

Service Factors	Par. 4.4
Pipe Connection Drawings	Par. 7.2

NOTE: *This specification supersedes the fifth edition of Spec 15LR dated October 1986. This specification was originally adopted in 1967. It was issued as tentative in 1968, and as Spec 5LR in 1972.*

Requests for permission to reproduce or translate all or any part of the material published herein should be addressed to the Director, Production Department, 2535 One Main Place, Dallas TX 75202-3904.

Copyright by the American Petroleum Institute

POLICY

API PUBLICATIONS NECESSARILY ADDRESS PROBLEMS OF A GENERAL NATURE, WITH RESPECT TO PARTICULAR CIRCUMSTANCES, LOCAL, STATE AND FEDERAL LAWS AND REGULATIONS SHOULD BE REVIEWED.

API IS NOT UNDERTAKING TO MEET DUTIES OF EMPLOYERS, MANUFACTURERS OR SUPPLIERS TO WARN AND PROPERLY TRAIN AND EQUIP THEIR EMPLOYEES, AND OTHER EXPOSED, CONCERNING HEALTH AND SAFETY RISKS AND PRECAUTIONS, NOR UNDERTAKING THEIR OBLIGATIONS UNDER LOCAL, STATE, OR FEDERAL LAWS.

NOTHING CONTAINED IN ANY API PUBLICATION IS TO BE CONSTRUED AS GRANTING ANY RIGHT, BY IMPLICATION OR OTHERWISE, FOR THE MANUFACTURE, SALE, OR USE OF ANY METHOD, APPARATUS, OR PRODUCT COVERED BY LETTERS PATENT, NETIHER SHOULD ANYTHING CONTAINED IN THE PUBLICATION BE CONSTRUED AS INSURING ANYONE AGAINST LIABILITY FOR INFRINGEMENT OF LETTERS PATENT.

GENERALLY, API STANDARDS ARE REVIEWED AND REVISED, REAFFIRMED, OR WITHDRAWN AT LEAST EVERY FIVE YEARS, SOMETIMES A ONE-TIME EXTENSION OF UP TO TWO YEARS WILL BE ADDED TO THIS REVIEW CYCLE. THIS PUBLICATION WILL NO LONGER BE IN EFFECT FIVE YEARS AFTER ITS PUBLICATION DATE AS AN OPERATIVE API STANDARD OR, WHERE AN EXTENSION HAS BEEN GRANTED. UPON REPUBLICATION, STATUS OF THE PUBLICATION CAN BE ASCERTAINED FROM THE API AUTHORING DEPARTMENT (TEL. 214-748-3841). A CATALOG OF API PUBLICATIONS AND MATERIALS IS PUBLISHED ANNUALLY AND UPDATED QUARTERLY BY API, 1220 L ST., N.W., WASHINGTON, D.C. 20005.

API SPECIFICATION FOR LOW PRESSURE FIBERGLASS LINE PIPE

FOREWORD

a. This specification is under the jurisdiction of the Committee on Standardization of Plastic Pipe of the American Petroleum Institute.

b. The purpose of this specification is to provide standards for Low Pressure Fiberglass Line Pipe for use in conveying produced fluids including oil, gas, nonportable water and mixtures thereof in the oil and gas producing industries.

c. Nothing in this specification should be interpreted as indicating a preference by the committee for any material or process or as indicating equality between the various materials or processes. In the selection of materials and processes, the purchaser must be guided by his experience and by the service for which the pipe is intended.

d. American Petroleum Institute (API) Specifications are published as aids to the procurement of standardized equipment and materials, as well as instructions to manufacturers of equipment or materials covered by an API Specification. These Specifications are not intended to obviate the need for sound engineering, nor to inhibit in any way anyone from purchasing or producing products to other specifications.

e. The formulation and publication of API Specifications and the API monogram program is not intended in any way to inhibit the purchase of products from companies not licensed to use the API monogram.

f. API Specifications may be used by anyone desiring to do so, and diligent effort has been made by the Institute to assure the accuracy and reliability of the data contained therein. However, the Institute makes no representation, warranty, or guarantee in connection with the publication of any API Specification and hereby expressly disclaims any liability or responsibility for loss or damage resulting from their use, for any violation of any federal, state, or municipal regulation with which an API Specification may conflict, or for the infringement of any patent resulting from the use of an API Specification.

g. Any manufacturer marking equipment or materials in conformance with the marking requirements of an API Specification is solely responsible for complying with all the applicable requirements of that Specification. The American Petroleum Institute does not represent, warrant or guarantee that such products do in fact conform to the applicable API Specification.

h. The procedure for obtaining authorization to use the API monogram is given in Appendix H.

i. This Standard shall become effective on the date printed on the cover but may be used voluntarily from the date of distribution.

Attention Users of this Publication: Portions of this publication have been changed from the previous edition. The location of changes has been marked with a bar in the margin. In some cases the changes are significant, while in other cases the changes reflect minor editorial adjustments. The bar notations in the margins are provided as an aid to users to identify those parts of this publication that have been changed from the previous edition, but API makes no warranty as to the accuracy of such bar notations.

SECTION 1
SCOPE

1.1 Coverage. This specification covers centrifugally cast (CC) and filament wound (FW) fiberglass line pipe and fittings for these pipe in diameters up to and including 16 inches rated for cyclic operating pressures up to and including 1000 psig. It is recommended that the pipe and fittings be purchased by pressure rating. The standard pressure ratings are 150 psig, 200 psig, 250 psig, and 300 psig. Pipe with pressure ratings greater than 300 psig can be purchased in 100 psig increments all based on cyclic pressures. For static pressure conditions higher pressure ratings may be used [refer to Par. 4.5(b)]. Quality control tests, hydrostatic mill tests, dimensions, weights, material properties, physical properties, and minimum performance requirements are included.

1.2 Referenced Standards

a. General. This specification includes by reference, either in total or in part, other API, industry and government standards listed in Appendix F.

b. Requirements. Requirements of other standards included by reference in this specification are essential to the safety and interchangeability of the quipment produced.

c. Equivalent Standards. Other nationally or internationally recognized standards shall be submitted to and approved by API for inclusion in this specification prior to use as equivalent standards.

1.3 Unit Conversion. A decimal/inch system is the standard for the dimensions shown in this specification. Norminal sizes will continue to be shown as fractions. For the purposes of this specification, the fractions and their decimal equivalents are equal and interchangeable. Metric conversions are described in Appendix I.

SECTION 2
PROCESS OF MANUFACTURE AND MATERIALS

2.1 Process of Manufacture. Pipe furnished to this specification shall be produced by the centrifugal casting (CC) or filament winding (FW) methods.

2.2 Material. The reinforced wall of pipe and fittings shall consist of thermosetting polymers reinforced with glass fibers. Acceptable polymers are epoxy resins, polyester resins, and vinyl ester resins. Couplings, connections, fittings, and adhesives shall meet the performance properties listed in Par. 4.6 and Par. 4.7 and shall be manufactured by a process and from materials compatible with the pipe system. They shall at least be equally resistant to the same fluids and environments as the pipe.

NOTES:
(1.) Other resins and reinforcements shall be considered for inclusion in this standard when evidence is presented to show that they are suitable for the applications covered by this standard.

(2.) Vinyl ester resins are defined in ASTM C-582.

Copyright by the American Petroleum Institute
Wed Feb 02 00:36:54 2005

SECTION 3
MATERIAL PROPERTIES AND TESTS

3.1 Pipe and fittings furnished to this specification shall conform to the material requirements listed in Par. 2.2.

3.2 Degree of Cure. Degree of cure shall be determined by differential scanning calorimetry (DSC). The glass transition temperature (T_g) shall be no less than the average production T_g value minus three standard deviations. The average production T_g shall be established by the manufacturer from DSC tests taken from typical API 15LR qualified production product.

Manufacturers shall establish these values for each resin system used.

3.3 Methods of Material Analysis

a. Degree of cure (T_g) shall be determined following the procedure in Appendix B.

b. Glass-resin ratios shall be determined following the procedures of Appendix A.

3.4 Frequency of Tests. The manufacturer shall supply a report showing the degree of cure (T_g) per Par. 3.2 and 3.3 at the frequency required by Par. 5.1(d) for pipe. Samples for material analysis shall be taken from production runs.

SECTION 4
PHYSICAL PROPERTIES AND TESTS

4.1 Physical Properties. Pipe furnished to this specification shall conform to physical property requirements in Par. 4.3. Certain other properties do not have specified requirements but are nevertheless important in piping system design. The manufacturer shall perform the tests shown in Pars. 4.1(a) — 4.1(h) as well as prepare all test reports in compliance with the applicable ASTM standard. Use of the reporting format shown in Appendix G is recommended. These results shall be available upon request.

a. Long-term hydrostatic strength cyclic at 150°F. ASTM D-2992 Procedure A.

b. Thermal Coefficient of Expansion, ASTM D-696.

c. Axial Tensile Modulus of Elasticity, ASTM D-2105.

d. Parallel Plate Crush, SF at 5% deflection, ASTM D-2412.

e. Ultimate Axial Tensile Strength, ASTM D-2105.

f. Hydrostatic Collapse Pressure, ASTM D-2924.

g. Short-time Hydraulic Failure Pressure of Plastic Pipe, Tubing, and Fittings, ASTM D-1599.

h. Beam bending modulus to determine pipe support spacing at 73.4°F and 150°F or maximum rated temperature when determined in accordance with ASTM D-2925.

4.2 Frequency of Tests. Pipe furnished to this specification shall be tested by the manufacturer as follows:

a. The short-term test which shall be performed at ambient temperature at the minimum frequency of one per lot as defined in 5.1(b) shall be one of the following:

1. Short-time hydrostatic failure pressure per ASTM D-1599.
2. Cyclic Pressure Strength (short-term) per ASTM D-2143 for 750 cycles minimum.

b. One long-term cyclic hydrostatic regression test to determine the hydrostatic design basis (HDB) shall be performed at 150°F(1) on pipe manufactured by each process which contains no significant product characteristic differences such as listed in Appendix E. The tests shall be conducted as follows:

NOTE (1): *When pipe is to be rated for temperatures higher than 150°F, the tests shall be conducted at the higher temperature.*

1. Initial tests — long-term cyclic hydrostatic pressure tests in compliance with ASTM D-2992 Procedure A.
2. Requalification Tests. The long-term cyclic HDB shall be verified at 150°F after any change as described in Appendix E by conducting abridged tests as follows:

Minimum Number of Samples	Cycles to Failure
2	1,000 to 10,000
2	10,000 to 3×10^6
2	at least 3×10^6

The failure points from these tests shall be combined with the failure points determined during the initial testing. The regression line determined

Copyright by the American Petroleum Institute
Wed Feb 02 00:36:54 2005

on the combined data shall be extrapolated to obtain a requalification Long-Term Hydrostatic Strength (LTHS). If the LTHS for the combined data is greater than or equal to the corresponding lower confidence limit (per ASTM D-2992 Annex A2) of the initial tests, then the initial LTHS may be used. Otherwise, the changed product shall be retested per Section 4 to obtain a new LTHS.

NOTE: *To qualify a changed product at a higher HDB, the product must be retested per Par. 4.2(b)1 to obtain the new HDB.*

c. Impact resistance. The impact resistance of 2″ through 6″ pipe with cyclic pressure ratings of 300 psi and less shall be tested initially following the procedure in Appendix C.

4.3 Minimum Properties. The minimum performance properties for tests specified in Par. 4.2 are:

a. Pipe shall hold for one minute a minimum hydrostatic pressure of 4.0 times its calculated cyclic operating pressure without failure when tested as per Par. 4.2(a)(1).

b. Pipe shall have a minimum short-term cyclic pressure life of 750 cycles when tested at a pressure equal to or greater than the lower confidence limit on the long-term cyclic hydrostatic pressure regression line when back calculated to 750 cycles.

c. The hydrostatic design basis (HDB) extrapolated to 150 million cycles shall equal or exceed the manufacturers published value current at the time of purchase.

d. All 2″ through 6″ pipe with cyclic pressure ratings of 300 psig or less shall have impact resistance which exceeds the requirements of Appendix C. NOTE: *This test is not considered applicable for other pipe.*

4.4 Service Factors. The maximum recommended service factor is 1.0 for the long-term cyclic HDB.

4.5 Pressure Rating.

a. The cyclic pressure rating for a pipe shall be calculated by using the following formula and the hoop stress values determined by the long-term cyclic test listed in Par. 4.2(b)1. The formula is:

$$P_c = \frac{2S_c t}{D}$$

Where:

P_c = internal cyclic pressure rating, psi

S_c = hoop stress = HDB × service factor, psi

t = minimum reinforced wall thickness, inches

D = average diameter inches (OD-t)

HDB_c = Hydrostatic Design Basis, cyclic, psi

b. **Static Pressure.** Additionally, a static pressure rating can be determined by use of one of the following:

$$P_s = 1.5 \times P_c$$

Where P_c is defined in Par. 4.5a and P_s is the internal static pressure rating, psi; or

$$P_s = 0.5 \times \frac{2S_s t}{D}$$

Where HDB_s (S_s) is determined by ASTM D-2992, Procedure B.

NOTE: *Except as indicated above, all references to HDB in this specification refer to the cyclic HDB, and all piping shall be given pressure ratings on the cyclic basis.*

4.6 Qualification Requirements for Fittings. Fittings, couplings, connections and adhesives shall meet the following performance requirements when tested with unrestrained ends in accordance with Par. 4.7.

a. Each component and its field-jointed configuration shall sustain a short-time hydrostatic pressure of at least four (4) times its cyclic rated pressure for one minute without visible weeping or leakage.

b. Each component shall meet or exceed the cycle test requirements of Par. 4.7.b.

4.7 Qualification Tests for Fittings, Couplings, and Connections. Test specimens shall include at least one fitting in each configuration, for example, 45 degree and 90 degree elbow, tee, flange, coupling (includes integral coupling) etc., joined to pipe sections at least 18 inches long or 2 diameters, whichever is longer, using the joining method, design, and adhesive intended for field assembly. Specimen diameters for test in each configuration shall include the maximum product size in each pressure class and each method of manufacture. In addition, smaller sizes in the pressure rating shall be tested as follows:

Product Size Range (inches)	Test Size (inches)
2, 2½, 3	3
4, 6	6
8, 10, 12	12
14, 16	16

In each range of size the manufacturer may elect at its option to test a smaller product size to qualify only the smaller size.

a. Short-time hydrostatic failure pressure tests to determine compliance with Par. 4.6 performed with unrestrained ends at ambient temperature in accordance with ASTM D-1599 using specimens and sizes as described above.

Copyright by the American Petroleum Institute
Wed Feb 02 00:36:55 2005

b. Cyclic Testing.

1. Using the cyclic test data and regression analysis as developed for the pipe under Par. 4.2(b)(1), a regression line is constructed converting the stress vs. cycle data to pressure vs. cycle data for pipe of the intended pressure class.

2. The gauge pressure at the peak pressure of the cycle shall be not less than 1½ nor more than 2 times the pressure rating of the corresponding pipe. The cycle amplitude pressure shall be at least 80% of the selected peak pressure.

3. Test each component specimen as required above with unrestrained ends in accordance with ASTM D-2143 at a test temperature of 150°F. (For components which are to be used at higher temperatures, the higher temperature shall be used.)

4. The number of cycles to failure for the component must be no less than that predicted by the HDB line lower 97.5% confidence limit of the corresponding pipe.

4.8 Requalification Tests for Fittings, Couplings, Connections and Adhesives. The qualification tests of Par. 4.7 shall be repeated after any change as described in Appendix E.

SECTION 5
QUALITY CONTROL TESTS

5.1 Pipe.

a. Mill Pressure Tests. Hydrostatic testing of pipe manufactured to this specification shall be done at a pressure of not less than 1.5 times the calculated cyclic pressure rating. The hydrostatic mill tests shall be conducted randomly with lengths taken during each shift from each production line, unless otherwise agreed upon between manufacturer and purchaser. All mill jointers shall be hydrostatically tested.

b. A lot of pipe shall consist of 5,000 feet or fraction thereof of one size, wall thickness and grade in continuous production.

c. The short-term cyclic pressure test or the short-time hydrostatic failure test per Par. 4.2(a) shall be conducted at a minimum frequency of one test per lot.

d. The test for degree of cure (T_g) per Pars. 3.2 and 3.3 shall be conducted at a mininum frequency of one test per lot.

5.2 Fittings.

a. Mill Pressure Tests — Hydrostatic testing or pneumatic testing of 6" and smaller fittings at a pressure equal to 1.5 times pressure rating shall be conducted at the frequency called for in Par. 5.2(a)(1) or Par. 5.2(a)(2).

1. Fittings shall be randomly tested with fittings taken during each shift from each production line, with at least 20 percent of all 45 degree elbows, 90 degree elbows, and tees tested.

2. Fittings (45 degree elbows, 90 degree elbows, and tees) shall be tested following the sampling plan of Appendix D.

5.3 Retests. If any test specimen of the tests specifically mentioned in Pars. 4.2(a), 5.1 and 5.2(a)(1) fails to conform to the specified requirements, the manufacturer may elect to make retests on two additional lengths or fittings from the same lot. If both of the retest specimens conform to the requirements, all of the lengths or fittings in the lot shall be accepted, except the length or fitting from which the initial specimen was taken. If one or both of the retest specimens fail to conform to the specified requirements, the manufacturer may elect to test individually the remaining lengths or fittings in the lot, in which case determinations are required only for the particular requirements with which the specimens failed to comply in the preceding test.

SECTION 6
DIMENSIONS AND LENGTHS

6.1 Dimensions. Fiberglass pipe shall be furnished in sizes shown in Table 6.1 as specified on the purchase order.

TABLE 6.1
DIMENSIONS

Nominal Size (inches)	Outside (1) Dia. (inches)	Inside(2) Dia. (inches) Minimum
2	2.375	2.00
2½	2.875	2.40
3	3.500	3.00
4	4.500	4.00
6	6.625	5.80
8	8.625	8.20
10	10.750	10.30
12	12.750	11.90
14	(3)	13.50
16	(3)	15.40

NOTES:

1. The outer diameters are applicable to:
   A. Sizes 2″ through 6″ with 300 psi cyclic pressure ratings.
   B. Sizes 8″ through 12″ with 150 psi cyclic pressure ratings.
   C. All centrifugal cast pipe.
   D. Other outside diameters shall be permitted by agreement between purchaser and manufacturer.
2. The minimum inside diameters are applicable to all filament wound pipe with cyclic pressure ratings greater than pipe covered by Note 1.
3. The minimum inside diameters are applicable to all pressure ratings of 14″ and 16″ diameter pipe.

6.2 Length. Pipe shall be furnished in lengths according to the following schedule.

Length 1	Length 2	Length 3
15 to 21 feet	21 to 34 feet	34 or more feet

Jointers (two pieces coupled to make a standard length) may be furnished to a maximum of 5 percent of the order; but no length used in making a jointer shall be less than 5 feet. Two standard lengths joined to make one long length is not a jointer, but shall be mill hydrotested at a pressure of 1.5 times the cyclic pressure rating.

6.3 Tolerances. Outside diameter of pipe furnished to this specification shall be within the tolerances listed in Table 6.2. The measurements shall be made in accordance with ASTM D-3567.

6.4 Wall Thickness. The pipe's minimum reinforced wall thickness shall not be less than that wall thickness calculated for its pressure class using Par. 4.5(a) and when measured per ASTM D-3567.

TABLE 6.2
DIMENSIONAL TOLERANCES

Nominal Size (Inches)	Outside Diameter (Inches)
2	+0.060,-0.018
2½	+0.060,-0.018
3	+0.060,-0.018
4	+0.066,-0.028
6	+0.086,-0.040
8	+0.108,-0.043

API SPEC*15LR 90 ■ 0732290 0092173 1 ■

SECTION 7
PIPE ENDS, CONNECTIONS, END PROTECTION, AND WORKMANSHIP

7.1 Pipe Ends. Pipe shall be furnished threaded, plain end, tapered, special and, or with alternate tapered ends as specified on the purchase order.

a. **Threaded Ends.** Threaded ends shall consist of male and female threads per ASTM D1694 or to API Spec 5B. Threaded joints shall meet the performance requirements of Pars. 4.6 and 4.7.

b. **Plain Ends.** Plain end pipe shall be furnished in lengths specified on the purchase order with square cut ends. Bell and spigot dimensions and tolerances are shown in Table 7.2.

c. **Tapered Ends.** Tapered ends shall consist of tapered spigots with either integral bells or sleeve couplings. Male and female ends shall conform to dimensions shown in Tables 7.1.a & 7.1.b. Tapered joints, when bonded in accordance with manufacturer's recommendation, shall meet the performance requirements of Pars. 4.6 and 4.7.

d. **Special Ends.** When so specified on the purchase order, pipe shall be furnished with ends suitable for use with special couplings. Mechanical joints with elastomeric seals are considered special ends and shall be in accordance with ASTM D4161. These special end connections, when joined in accordance with manufacturer's recommendations, shall meet the performance requirements of Par. 4.6 and 4.7.

e. **Alternate Tapered Ends.** Alternate tapered ends which do not meet the taper angle and spigot end diameter requirements shown in Table 7.1a for nominal sizes 8 inches through 16 inches shall be allowed and shall be identified by the letters "ATE" following the API monogram. Alternate tapered end joints, when bonded in accordance with manufacturer's recommendation, shall meet the performance requirement of Par. 4.6 and 4.7. The angle of alternate taper angle shall be identified in the pipe marking immediately following "ATE" when an alternate taper angle is used.

7.2 Pipe Drawings. The manufacturer shall furnish drawings of the pipe and any special couplings or sealing devices, including dimensions and tolerances, when requested by the purchaser.

7.3 Workmanship. All pipe furnished to this specification shall meet the visual inspection limits listed in Table 7.3.

NOTE: *The dimensions of the spigots for the tapered end adhesive bonded joints are substantially changed from API 5LR dated March 1976; therefore, materials manufactured prior to March 1976 shall be in compliance with 5LR and materials manufactured after October 15, 1986 shall be in compliance with 15LR.*

7.4 Repair of Surface Imperfections. Removal of surface imperfections by methods such as grinding or filing shall be permissible, provided the grinding or filing does not cut into any of the reinforcement, and that all ground or filed areas are coated prior to shipment with the same base resin as was used in the manufacture of the product.

7.5 End Protection. The manufacturer shall provide end protection of such design, material and mechanical strength to protect the ends of the pipe, fittings and end connections from damage under normal handling and transportation. The end protector for female ends shall cover the end to prevent damage by ultra-violet radiation and other weather elements. The end protector's length shall be long enough to cover:

a. All threads of male threaded (pin end) pipe.

b. All machined or ground surfaces of male end (spigot) adhesive bonded joint pipe.

c. All sealing surfaces of elastomeric sealed joints.

TABLE 7.3
VISUAL STANDARDS

DEFECT	DESCRIPTION	MAXIMUM SIZE
PIPE BODY AND COLLAR		
Burn	thermal decomposition evidenced by distortion or discoloration of the surface	20% area—lightly blemished 5%, area—moderate burn of outer resin layer, structural roving
Chip	small piece broken from edge or surface	permitted if laminate has not been fractured
Crazing	fine cracks at or under the surface as seen by the unaided eye	none permitted
Cut Roving	broken or cut outer rovings due to scraping or scuffing or manufacturing process	maximum 3 per pipe with one square inch maximum size maximum depth of 10% of the nominal wall thickness
Dry Spot	area where reinforcement was not thoroughly wet with resin	maximum 3 streaks per pipe — ½ inch wide, 4 in. long, no dry reinforcement exposed
Fracture	Rupture of laminate without complete penetration. Visible as lighter colored area of interlaminar separation	none permitted
Pits (pinholes)	small craters in the surface	maximum $1/16$" deep, no limit on number
Resin Drip	resin protrusion	maximum ⅛ in. high, no limit on number
Scratch	shallow mark caused by improper handling	no limit on number if reinforcement is not exposed
THREADS		
Air Bubbles	light patch at the root of the thread caused by entrapped air	maximum size ⅛" in any direction and one bubble allowed per connection
Chips	areas where over 10% of thread height is removed	maximum ½" long in one thread per connection

SECTION 8
MARKING

8.1 Pipe manufactured in conformance with this specification shall be marked by the manufacturer as specified in Section 8.2. (Additional markings as desired by the manufacturer or as requested by the purchaser are not prohibited.) Markings shall be permanent, shall not overlap, and shall be applied in such manner as not to damage the pipe.

8.2 Pipe shall be marked with the following:

a. Manufacturer's name or mark

b. Size, nominal, inches

c. Cyclic pressure rating

d. Lot number

e. "Spec 15LR"*

*Users of this specification should note that there is no longer a requirement for marking a product with the API monogram. The American Petroleum Institute continues to license use of the monogram on products covered by this specification but it is administered by the staff of the Institute separately from the specification. The policy describing licensing and use of the monogram is contained in Appendix H, herein. No other use of the monogram is permitted. Licensees should refer to Par. H-13 for marking requirements.

Wed Feb 02 00:36:56 2005

SECTION 9
INSPECTION AND REJECTION

9.1 Inspection Notice. Where the purchaser or his authorized inspector desires to inspect this pipe, the manufacturer shall give reasonable notice as to when the pipe shall be ready for inspection.

9.2 Plant Access. The inspector representing the purchaser shall have free entry at all times while work on contract of the purchaser is being performed, to all parts of the manufacturer's plant which will concern the inspection of pipe ordered. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy him that the pipe is being furnished in accordance with this specification. All inspections shall be made at the place of manufacture prior to shipment, unless otherwise specified on the purchase order, and shall be so conducted as not to interfere with plant operations.

9.3 Compliance. The manufacturer is responsible for complying with all provisions of this specification. The purchaser may make any investigation necessary to satisfy himself of compliance by the manufacturer and may reject any material that does not comply with this specification. If tests that require the destruction of material are made other than at the place of manufacture, the purchaser shall accept that material which meets the specification but shall reject material which fails to meet the specification.

APPENDIX A
METHOD OF TEST FOR GLASS-RESIN RATIO OF FIBERGLASS PIPE

Scope

A-1 This appendix covers method of test for the determination of the glass-resin ratio of fiberglass pipe.

Summary of Method

A-2 The Glass-Resin Ratio Test consists of cutting a 1 inch × 1 inch sample from the pipe wall, containing it in a crucible, igniting the material, and allowing it to burn until only ash and carbon remain. The carbonaceous residue is reduced to an ash by heating in a muffle furnace at 1050°F (565°C) cooled in a desiccator and weighed.

A-3 Equipment:

a. Crucible, made of platinum or porcelain, approximately 30 ml capacity.

b. Electric Muffle Furnace, capable of maintaining a temperature of 1050 ±50°F (565 ±28°C).

A-4 Procedure:

a. Heat a crucible at 932 to 1112°F (500 to 600°C) for 10 minutes or more. Cool to room temperature in a desiccator and weigh to the nearest 1.0 mg.

b. Place approximately 5 g. of sample in the crucible and weigh to the nearest 1.0 mg. The maximum size of the sample pieces shall be 1 inch × 1 inch × thickness (25.4 × 25.4 mm). Heat the crucible and sample in a Bunsen flame until the contents ignite. Maintain such a temperature that the sample burns at a uniform and moderate rate until only ash and carbon remain when the burning ceases.

NOTE 1: *It is often convenient to use samples obtained from specimens that have been tested for mechanical properties such as flexural or tensile strength. The samples must be dry and the fractured areas removed, leaving square, unfrayed faces, before these samples are weighed and ignited.*

NOTE 2: *It is not absolutely necessary to ignite the sample in a Bunsen flame. Instead the crucible and contents can be placed in a muffle furnace at a temperature lower than 1050°F (565°C) and ignited. Care must be taken that there will be no mechanical loss of the noncombustible residue.*

NOTE 3: *If the "volatile" content of the sample is desired, determine the weight loss of the crucible and contents after placing in an oven at 212°F (100°C) before ignition. The time crucible and contents must remain in the oven is dependent on the type of "volatiles" present and the specimen geometry.*

c. Heat the crucible and residue in the muffle furnace at 1050 ±50°F (568 ±28°C) until all carbonaceous material has disappeared. Cool the crucible to room temperature in a desiccator and weigh to the nearest 1.0 mg.

NOTE 4: *The time for the carbonaceous residue to disappear is dependent largely on the sample geometry. It can be up to six hours but is usually much less.*

d. Reheat the crucible at 1050°F (565°C) for 10 to 20 minutes, cool in a desiccator and reweigh. Repeat the heating and weighing until consecutive weighings differ by no more than 1.0 mg.

e. Determine the ignition loss on at least two more portions of the same reinforced resin sample.

A-5 Calculations:

a. Calculate the ignition loss of the sample as follows:

$$\text{Ignition loss, \% w} = \frac{(W_1 - W_2) \times 100}{W_1}$$

where:

W_1 = weight of the sample, grams.

W_2 = weight of the residue, grams.

b. Calculate the estimated standard deviation as follows:

$$s = \sqrt{\frac{x^2 - n(\bar{x})^2}{n-1}}$$

s = estimated standard deviation.

x = value of single observation.

n = number of observations.

$\bar{x}$ = arithmetic mean of the set of observations.

A-6 Report: The report shall include the following:

a. The ignition loss, %w and standard deviation. If only glass reinforcement and organic resin were present, the ignition loss can be considered to be the resin content.

b. Observations in regard to any irregularities noted in the physical properties of the residue, such as melting.

c. Pipe identification from number on pipe.

d. Any irregularities noted during the test.

e. Date of test.

APPENDIX B
METHOD OF TEST FOR THE DETERMINATION OF DEGREE OF CURE BY DIFFERENTIAL SCANNING CALORIMETRY (DSC)

B-1 Scope. This test determines the degree of cure of a fiberglass pipe test specimen relative to statistically significant values obtained from typical production product.

B-2 Definition. Glass transition temperature (T_g) is defined as the midpoint of the inflection temperature at the DSC curve (heat flow vs. temperature).

B-3 Apparatus. Differential scanning calorimeter (DSC).

B-4 Test Specimens.

a. **Size.** The size of the specimen is limited by the size of the DSC sample pan. All specimens *can be a chip* or filed into a fine powder to provide easy weighing and uniform contact with the pan.

b. **Location.** For any given piece of pipe, a sample should be taken 0-10 mils from the outer surface, as well as 0-10 mils from the inner surface. If the pipe sample has a liner, then a specimen should be taken from the liner as well as the inner and outer edges of the over-wrap.

B-5 Procedure.

a. *Maximum* heating rate is *40*°C/minute.

b. Run the scan from room temperature to at least 30°C above the expected glass transition temperature and no more than 250°C.

c. Obtain the T_g (midpoint of the inflection in the DSC curve).

B-6 Report. The report shall include the following items.

a. Complete identification of the specimens, including material, manufacturer's name and lot number (Section 9).

b. Pipe dimensions, including nominal size, minimum reinforced wall thickness, and average outside diameter of reinforced wall. Unreinforced thicknesses (i.e., liner) shall also be reported.

c. Number of specimens tested and where the specimens were taken from the pipe.

d. Heat-up rate for DSC initial temperature and final temperature for both scans.

e. Record glass transition temperature (inflection value) for the first scan as T_g.

f. Date of test.

API SPEC*15LR 90 ■ 0732290 0092181 0 ■

APPENDIX C
METHOD OF TEST FOR IMPACT RESISTANCE OF FIBERGLASS PIPE

C-1 Scope. This appendix covers the method of test for the determination of impact resistance of fiberglass pipe.

C-2 Apparatus.

a. A steel ball 2.0 inches in diameter weighing about 1.2 pounds and flat pipe support.

b. Pipe specimen pressurization equipment, soluble fluorescent dye, and ultraviolet lamp.

C-3 Test Specimens and Conditions. One sample each in 2, 3, 4 and 6-inch diameter shall be tested at 73.4F. The pipe shall be fitted with suitable end closures to permit the sample to be pressurized. The specimen length between the end closures shall be not less than five times the outside diameter of the pipe, but in no case less than 12 inches.

C-4 Procedure.

a. A steel ball 2.0 inches in diameter and weighing about 1.2 pounds shall be dropped squarely onto the surface of the pipe with a free fall (which may be guided) for a distance of 12 inches. The ball may be caught or deflected after the hit so that the rebound does not hit the pipe. The pipe shall be full of water containing a soluble fluorescent dye, but not pressurized.

b. The pipe shall be supported on its bottom axis on a solid flat support. Four drops shall be made on randomly selected areas which are a minimum of one pipe diameter and 90 degrees clockwise from each other.

c. The pipe shall then be pressurized to 3.5 times the rated pressure and shall remain at this pressure for five minutes.

d. The pipe shall be examined with an ultraviolet lamp and the unaided eye. Failure in the test specimens shall be leaking or porosity, or any visible shattering, crack, or split from the impact.

C-5 Report. The report shall include the following items:

a. Complete identification of the specimens, including material, manufacturer's name and lot number.

b. Pipe dimensions including nominal size, minimum reinforced wall thickness and average outside diameter of reinforced wall. Unreinforced thicknesses (i.e., liner) shall also be reported.

c. Number of specimens tested and where the specimens were taken from the pipe.

d. Node of failure or other visual indications.

e. Date of test.

APPENDIX E
PRODUCT CHARACTERISTICS

Changes in the following characteristics of the system shall require testing in accordance with 4.2(b)2.

E-1 Reinforcement. Significant changes shall be filament diameter, yield, or weight; reinforcement finish (sizing); reinforcement manufacturing process (e.g., single end or multiple end); and reinforcement composition.

E-2 Matrix Material (Resin System). Significant changes shall be resin type, curing agent(s) system, curing temperature, and curing schedule for heat-cured products outside manufacturer's specified tolerances.

E-3 Liner. Significant changes shall be the composition, curing, and thickness outside manufacturer's specified tolerances.

E-4 Geometry. Significant changes shall be the winding angle(s) in excess of ±5 degrees; number of resin reinforcement layers and/or reinforcement layer thickness in excess of 30 percent and/or stacking sequence; percent reinforcement in each direction in excess of ±3 percent; and glass to resin ratio in excess of ±3 percent.

E-5 Report. Use of the following reporting format is recommended.

REPORTING FORMAT FOR API SPEC 15LR APPENDIX E — PRODUCT CHARACTERISTICS

E-1 Reinforcement:

Reinforcement manufacturer: _____

Reinforcement manufacturer's product code number: _____

Filament Diameter: _____

Nominal Yield: _____

Reinforcement manufacturer's sizing code number: _____

Form (e.g. single end or multiple end): _____

Reinforcement composition: _____

E-2 Matrix material:

Resin type: _____

Resin manufacturer: _____

Resin manufacturer's product code number: _____

Curing agent(s) system: _____

Curing temperature: _____

Curing schedule: _____

E-3 Liner (if any):

Resin type: _____

Resin manufacturer: _____

Resin manufacturer's product code number: _____

Curing agent(s) system: _____

Curing temperature: _____

Curing schedule: _____

Nominal thickness: _____

Minimum thickness: _____

Maximum thickness: _____

E-4 Geometry:

Wind angle(s): _____

Number of reinforcement layers: _____

Nominal reinforcement layer thickness: _____

Stacking sequence: _____

Percent reinforcement in each direction: _____

Glass to resin ratio: _____

APPENDIX H
USE OF API MONOGRAM

H-1 Board Resolution. The original resolutions adopted by the Board of Directors of the American Petroleum Institute on October 20, 1924, embodied the purpose and conditions under which such official monogram may be used. A restatement of the resolutions was adopted by the Board of Directors on November 14, 1977, and is reproduced herein as Exhibit A.

H-2 API Monogram. The API monogram — API — is a registered trademark/servicemark of the American Petroleum Institute. Authorization to use the monogram is granted by the Institute to qualified licensees for use as a warranty that they have obtained a valid license to use the monogram and that each individual item which bears the monogram conformed, in every detail, with the API Specification applicable at the date of manufacture. However, the American Petroleum Institute does not represent, warrant or guarantee that products bearing the API monogram do in fact conform to the applicable API specification. Such authorization does not include use of the monogram on letterheads or in advertising without the express statement of fact describing the scope of licensee's authorization and further does not include use of the monogram, the name AMERICAN PETROLEUM INSTITUTE or the description "API" in any advertising or otherwise to indicate API approval or endorsement of products.

The formulation and publication of API Specifications and the API monogram program is not intended in any way to inhibit the purchase of products from companies not licensed to use the API monogram.

H-3 Application for Authority to Use Monogram. Manufacturers desiring to mark their products with the monogram may apply for a license to use the monogram with forms provided in an appendix to each applicable API specification.

Separate applications shall be made for each facility at which the manufacturer desires to apply the monogram and for each API Specification, or part thereof, under which authorization is desired to monogram products at that facility.

The monogram program that involves conformance with API Spec Q1 and surveys, as noted in Par. 3.4, 3.7 and 3.8, will be implemented under each API specification according to a schedule developed by the API staff. Existing licensees and applicants under those specifications which have these requirements will be notified prior to implementation. For specifications not yet under the Spec Q1 and survey program, a decision to award or withhold monogram rights will be made on an objective basis by the Institute from information gained from the "Statement of Manufacturer's Qualifications" form provided in the appendix of that specification.

H-4 Authorization to Use the Monogram. Applicants shall have an approved quality program functioning in conformance with API Spec Q1 and with specific requirements of the applicable API Specification at any particular facility prior to being issued a license to use the API monogram at that facility.

A decision to award or withhold monogram rights will be made by the staff of the Institute subsequent to a survey of the applicant's facilities located at the facility where the monogram is to be applied. The decision will be based upon the extent to which the objective evidence collected during the survey substantiates the manufacturer's conformance to his quality program as described in his Quality Manual which shall meet the requirements of the appropriate API specifications including API Spec Q1.

Each facility where the monogram is to be applied will be judged separately. If approved, a separate license will be granted at that facility. These licenses shall not be assignable or transferable by the Licensee in any manner nor shall Licensee have the right to grant sublicenses. The application of the monogram may not be subcontracted.

Each authorization shall be effective for a period of three years, subject to cancellation for cause.

H-5 Application of the Monogram to the Product.

a. The monogram may be applied at any time appropriate to the manufacturing process.

b. Only an API licensee may apply his monogram.

c. The monogram shall be applied at the licensed facility.

d. A marking procedure specified by the applicable API Specification shall be used to apply the monogram and the date of manufacture.

H-6 Fee for Use of Monogram. The fees assessed are to defray the cost of administering the Monogram Program.

Initial Authorization Fee. The applicant will be assessed an initial authorization fee for the first Specification included in the application, and a separate fee for each additional Specification included in the application.

Annual Renewal Fee. In addition to the initial authorization fee, licensees will be assessed an annual renewal fee for each specification under which he is authorized to use the monogram. First-time applicants issued monogram certificates dated November 1 through December 31 shall not be required to pay a renewal fee for the following year.

Copyright by the American Petroleum Institute
Wed Feb 02 00:36:59 2005

H-7 Surveys.

Initial and Renewal Surveys. First-time applicants and licensees on every third year renewal of license shall be surveyed by qualified surveyors. The parameters of these surveys shall be the appropriate API specifications and the manufacturer's quality manual. The surveys will be performed to gather objective evidence for API's use in verifying that the manufacturer is in conformance with the provisions of the Manufacturers Quality Program as applicable to the API specifications. The manufacturer will be invoiced for the cost of these surveys.

Periodic Surveys. Existing licensees will be periodically surveyed by an approved API surveyor on a nondiscriminatory basis to determine whether or not they continue to qualify for authorization to use the monogram. The frequency of the periodic surveys will be at the discretion of the staff of the Institute. Costs of periodic surveys will be paid by the Institute.

H-8 Cancellation of Monogram Rights. The right to use the monogram is subject to cancellation for the following causes:

a. Applying the monogram on any product that does not meet the Specification.

b. Failure to maintain or have access to properly maintained reference master gages when required by the Specifications.

c. Failure to meet the requirements of a survey.

d. Failure to pay the annual renewal fee for use of the monogram.

e. For any other nondiscriminatory reason satisfactory to the API Staff.

H-9 Reinstatement of Monogram Rights. Manufacturers whose authorization to use the monogram has been cancelled may request reinstatement at any time. If a request for reinstatement is made within sixty (60) days after cancellation, and if the reason for cancellation has been corrected, no new application is necessary. A resurvey of the manufacturer's facilities will be made by an approved Institute surveyor prior to a decision to reinstate monogram rights. The manufacturer will be invoiced for this resurvey regardless of the Institute's decision on reinstatement. If the result of the resurvey indicates to the API staff that the manufacturer is qualified, the license will be reissued.

Request for reinstatement made more than sixty (60) days after cancellation shall be treated as a new application unless circumstances dictate an extension of this time period as agreed upon by the API staff.

H-10 Appeals. An interested party may appeal a decision by the Institute to withhold monogram rights. Appeals shall be directed to the Director, API Production Department and handled by the General Committee of the Production Department with a further right of appeal to the API Management Committee. Competing suppliers or manufacturers of the product or service to which the standard applies or might apply may not be involved in appeals. The General Committee and the Management Committee may convene appeals boards to hear and act on appeals.

H-11 Users Responsibilities. The effectiveness of the API standardization program can be enhanced by users reporting problems encountered with API monogrammed products to the Institute. API solicits information on both new product nonconformance with API requirements and field failures (or malfunctions) which are judged to be caused by either specification deficiencies or nonconformance with API requirements.

H-12 Special API Records. The API staff shall maintain and publish a current list of manufacturers licensed to use the API monogram for each API Specification. The document titled *Composite List of Manufacturers Licensed for Use of the API Monogram* shall be updated twice a year, and a copy shall be mailed to each licensed facility as soon as practical after receipt from the printer. Copies shall be made available to the public at the same time.

The API staff shall also maintain records of reported problems encountered with API monogrammed products. These records will be used internally only by API in evaluation of the quality program and API specifications and will be held in confidence.

H-13 Marking for API Licensees. The following marking requirements apply to licensed manufacturers using the API monogram on products covered by this specification.

a. Pipe manufactured in conformance with this specification shall be marked by the manufacturer as specified in Section 8.2. (Additional markings as desired by the manufacturer or as requested by the purchaser are not prohibited.) Markings shall be permanent, shall not overlap, and shall be applied in such manner as not to damage the pipe.

b. Pipe shall be marked with the following:

1. Manufacturer's name or mark
2. Size, nominal, inches
3. Cyclic pressure rating
4. Lot number
5. API monogram
6. API license number
7. Date of manufacture

EXHIBIT A
BOARD RESOLUTION

The original resolutions adopted by the Board of Directors of the American Petroleum Institute on Oct. 20, 1924, embodied the purpose and conditions under which such official monogram may be used.

The following restatement of the resolutions was adopted by the Board of Directors on November 14, 1977:

WHEREAS, The Board of Directors of the American Petroleum Institute has caused a review of the Institute's program for licensing the use of the API monogram and

WHEREAS, It now appears desirable to restate and clarify such licensing policy and to confirm and make explicitly clear that it is the licensees, not API, who make the representation and warranty that the equipment or material on which they have affixed the API monogram meets the applicable standards and specifications prescribed by the Institute;

NOW, THEREFORE, BE IT RESOLVED, That the purpose of the voluntary Standardization Program and the Monogram Program of the American Petroleum Institute is to establish a procedure by which purchasers of petroleum equipment and material may identify such equipment and materials as are represented and warranted by the manufacturers thereof to conform to applicable standards and specifications of the American Petroleum Institute; and be it further

RESOLVED, That the previous action under which the following monogram was adopted as the official monogram of the American Petroleum Institute is reaffirmed;

BE IT FURTHER RESOLVED, That the American Petroleum Institute's monogram and standardization programs have been beneficial to the general public as well as the petroleum industry and should be continued and the Secretary is hereby authorized to license the use of the monogram to anyone desiring to do so under such terms and conditions as may be authorized by the Board of Directors of the American Petroleum Institute, provided that the licensee shall agree that the use of the monogram by such licensee shall constitute the licensee's representation and warranty that equipment and materials bearing such monogram complies with the applicable standards and specifications of the American Petroleum Institute; and that licensee shall affix the monogram in the following manner;

BE IT FURTHER RESOLVED, That the words "Official Publication" shall be incorporated with said monogram on all such standards and specifications that may hereafter be adopted and published by the American Petroleum Institute, as follows:

APPENDIX I
METRIC CONVERSIONS

US Customary units are in all cases preferential and shall be the standard in this specification.

LENGTH

1 inch (in.) = 25.4 millimetres (mm) exactly

PRESSURE

1 pound per square inch (psi) = 0.06894757 Bar

NOTE: 1 Bar = 100 kilopascals (kPa)

STRENGTH OR STRESS

1 pound per square inch (psi) = 0.006894757 Megapascals (MPa)

IMPACT ENERGY

1 foot-pound (ft-lb) = 1.3558181 Joules (J)

TORQUE

1foot-pound (ft-lb) = 1.3558181 newton-metres (N m)

TEMPERATURE

The following formula was used to convert degrees Fahrenheit (°F) to degrees Celsius (°C):

$$°C = 5/9 (F-32)$$

MASS

1 pound (lb) = 0.4535924 kilograms (kg)

PUBLICATIONS LIST

The following related publications are under the jurisdiction of the API Committee on Standardization of Plastic Pipe and are available from the American Petroleum Institute, 1220 L Street, Northwest, Washington, DC 20005; (202) 682-8375.

SPECIFICATIONS

Spec 15HR: **Specification for High Pressure Fiberglass Line Pipe.**
This specification covers high pressure fiberglass line pipe for use in the production of oil and gas.

RECOMMENDED PRACTICES

RP 15A4: **Recommended Practice for Care and Use of Reinforced Thermosetting Resin Casing and Tubing.**
Provides information on transporting, handling and installing reinforced thermosetting resin casing and tubing in oil field usage.

RP 15L4: **Recommended Practice for Care and Use of Reinforced Thermosetting Resin Line Pipe (RTRP).**
Provides information on the transporting, handling, installing, and repairing of reinforced thermosetting resin line pipe (RTRP) in oil field usage.

20 August 1991 for
ASME B1.1-1989
29 August 1989
SUPERSEDING
ANSI B1.1-1982
20 April 1984

ASME B1.1-1989 was adopted on 20 August 1991 and is approved for use by the Federal agencies. The American Society of Mechanical Engineers (ASME) prepared this document which was approved by the American National Standards Institute (ANSI) as an American National Standard. Both ASME and ANSI have furnished clearances required by existing regulations. Copies of this document are stocked by the Standardization Documents Order Desk, Building 4D, 700 Robbins Avenue, Philadelphia, PA 19111-5094, for issue to DoD activities only. All other requestors must obtain documents from:

The American Society of Mechanical Engineers
United Engineering Center
345 E. 47th St.
New York, NY 10017

or

The American National Standards Institute

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda or written interpretations of the requirements of this Standard issued to this edition.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

(This Foreword is not part of ASME B1.1-1989.)

This Standard is the outgrowth of and supersedes previous editions that were published as B1-1924, B1.1-1935, B1.1-1949, B1.1-1960, B1.1-1974, and B1.1-1982. Throughout such development, special attention has been given to the practical aspects of thread standardization, and many details of the current Standard result from studies and tests based on user problems. For example, there was disclosed the need for free assembly in high-production industries and the desirability of making some provision for threads that require a coating. The tolerance classes 2A/2B were developed to meet these two major requirements as well as to provide a general standard for externally and internally threaded fasteners.

This issue includes: (a) latest symbols in accordance with latest issue on Nomenclature, ANSI/ASME B1.7M; (b) a clearer definition of acceptability criteria as described in ANSI/ASME B1.3M; (c) sketches and drawings altered to meet the latest legibility requirements. The diameter–pitch combinations remain the same as in previous editions.

The Unified Screw Threads Standard is an integrated system of threads for fastening purposes in mechanisms and structures. Its outstanding characteristic is general interchangeability of threads, achieved through the standardization of thread form, diameter–pitch combinations, and limits of size.

The Standard has as its original basis the work done more than a century ago by William Sellers in the United States and Sir Joseph Whitworth in Great Britain. Throughout the intervening years there have been many further developments and revisions, culminating in the system of Unified Threads approved and adopted for use by all inch-using countries.

The achievements represented by ASME B1.1 in development, standardization, and unification are the result of cooperation and coordination of many organizations, including The American Society of Mechanical Engineers, Society of Automotive Engineers, National Institute of Science and Technology (formerly National Bureau of Standards), Committee B1, the former National Screw Thread Commission, the former Interdepartmental Screw Thread Committee, British Standards Institution, Canadian Standards Association, and American National Standards Institute.

Unification of screw thread standards received its impetus from the need for interchangeability among the billions of fasteners used in the complex equipment of modern technology and made in different countries. Equally important, however, are international trade in mechanisms of all kinds and the servicing of transportation equipment which moves from country to country. These have made unification not only highly advantageous, but practically essential. In sizes $\frac{1}{4}$ in. and larger, complete unification of certain thread series and six tolerance classes was signaled by the signing of an accord on November 18, 1948. Since that time, further unification has been extended into smaller sizes. Working through Technical Committee No. 1 of the International Organization for Standardization (ISO), the unified standard was adopted as an ISO inch screw thread standard, ISO 5864, parallel to the ISO metric screw thread system. Both systems have a common basic profile. The standard was subject to Quadripartite Standardization Agree-

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:05 2005

ment (QSTAG) 247, in the ABCA Army Standardization Program of America, Britain, Canada, and Australia.

Suggestions for improvement of this Standard will be welcomed. They should be sent to the American National Standards Institute, 1430 Broadway, New York, New York, 10018.

ASME B1.1-1989 was approved by the American National Standards Institute (ANSI) on August 29, 1989.

UNIFIED INCH SCREW THREADS (UN AND UNR THREAD FORM)

1 GENERAL

1.1 Scope

This Standard specifies the thread form, series, class, allowance, tolerance, and designation for unified screw threads. (In order to emphasize that unified screw threads are based on inch modules, they may be denoted unified inch screw threads.) Several variations in thread form have been developed for unified threads; however, this Standard covers only UN and UNR thread forms.

For easy reference, a metric translation of this Standard has been incorporated as Appendix C. Appendices A through C contain useful information that is supplementary to the sections of this Standard.

1.2 Unified Screw Thread Standards

The standards for unified screw threads published in this Standard are in agreement with formal standards of the International Organization for Standardization for diameter–pitch combinations, designations, and tolerances for 60 deg. triangular form inch screw threads. Unified screw threads had their origin in an accord signed in Washington, D.C., on November 18, 1948, by representatives of standardizing bodies of Canada, the United Kingdom, and the United States, and have subsequently superseded American National screw threads.

1.3 UN and UNR Screw Threads

UNR applies only to external threads; the difference between UN and UNR threads, in addition to designation, is that a flat or optional rounded root contour is specified for UN threads, while only a rounded root contour is specified for UNR threads.

1.4 Interchangeability

Unified (UN/UNR) and its predecessor, American National screw threads, have substantially the same thread form, and threads of both standards having the same diameter and pitch are mechanically interchangeable. The principal differences between these standards relate to the application of allowances, the variation of tolerances with size, differences in the amounts of pitch diameter tolerances for external and internal threads, and differences in thread designations. Unified inch and ISO metric screw threads are not mechanically interchangeable.

1.5 Designations

Unified thread sizes (specific combinations of diameter and pitch) are identified by the letter combination "UN" in the thread symbol. In the unified standards, the pitch diameter tolerances for external threads differ from those for internal threads; for this reason the letter "A" is used in the thread symbol to denote an external thread and the letter "B," an internal thread. Where the letters "U," "A," or "B" do not appear in the thread designation, the threads conform to the outdated American National screw threads. Details regarding thread designations are given in Section 6.

1.6 Reference Documents

The latest issues of the following documents form a part of this Standard to the extent specified herein.

American National Standards

When the following American National Standards referred to in this Standard are superseded by a revision approved by the American National Standards Institute, Inc., the revision shall apply.

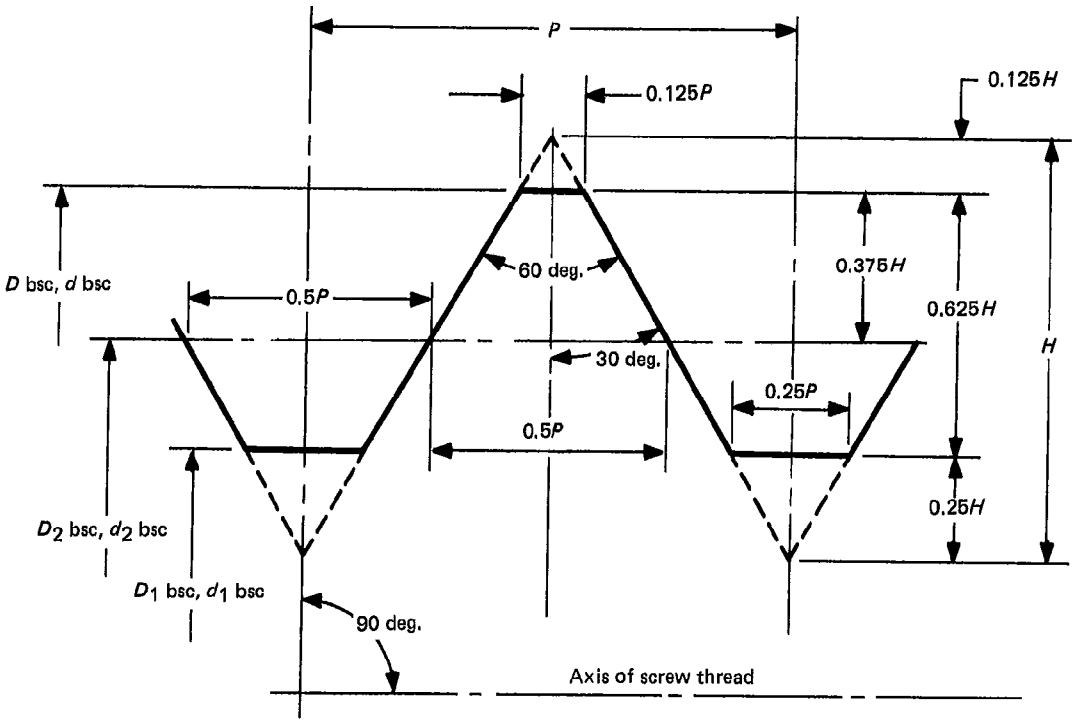

FIG. 1 BASIC PROFILE FOR UN AND UNR SCREW THREADS

International Organization for Standardization
ISO 68
ISO General Purpose Screw Threads—Basic Profile

1.7 Acceptability

Acceptability of product threads shall be in accordance with ANSI/ASME B1.3M. Gages and gaging shall be in accordance with ANSI/ASME B1.2.

1.8 Reference Temperature

The reference temperature is 68°F for dimensions defined by this system.

1.9 Units of Measure

All dimensions in this Standard, including all tables, are in inches unless otherwise specified.

1.10 Federal Government Use

When this Standard is approved by the Department of Defense and federal agencies and is incorporated into FED-STD-H28/2, Screw-Thread Standards for Federal Services, Section 2, the use of this Standard by the federal government will be subject to all the requirements and limitations of FED-STD-H28/2.

2 SCREW THREAD PROFILE

2.1 Scope

The basic profile and design profiles are defined in this Section and are the basis of all thread dimensions given in this Standard.

2.2 Basic Profile

The basic profile for UN screw threads is identical to that for UNR screw threads and is shown in Fig. 1. Profile applies to an axial plane.

For reference, the basic profile for UN and UNR screw threads is identical to that for ISO metric screw threads shown in ISO 68.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:07 2005

2.3 Design Profiles

The design profiles define the maximum-material conditions for external and internal threads with no allowance and are derived from the basic profile. The design profiles of both external and internal screw threads vary from the basic profile.

2.3.1 Design Profiles of External Threads. The design profiles of external UN and UNR screw threads are included in Figs. 2 and 3. A flat root contour is specified for UN threads; however, it is permissible to provide for some threading tool crest wear. Therefore, a rounded root contour cleared beyond the 0.25*P* flat width of the basic profile is optional. The rounded root also reduces the rate of threading tool crest wear and improves fatigue strength over that of a flat root thread.

(a) The root contour of external UNR screw threads shown in Figs. 2 and 3 shall have a smooth, continuous, nonreversing contour with a radius of curvature not less than 0.108*P* at any point and shall blend tangentially into the flanks and any straight segment. At the maximum-material condition, the point of tangency shall be at a distance not less than 0.625*H* below the basic major diameter.

(b) The design profiles of external UN and UNR screw threads have flat crests. However, in practice, product thread crests may be flat, or partially or corner rounded. A rounded crest tangent at a 0.125*P* flat is shown as an option in Figs. 2 and 3.

2.3.2 Design Profile of Internal Threads. The design profile of the internal UN screw thread is included in Figs. 2 and 3 (*there is no internal UNR screw thread*). In practice it is necessary to provide for some threading tool crest wear; therefore, the root of the design profile is rounded and cleared beyond the 0.125*P* flat width of the basic profile.

2.4 Formulas and Symbols

The formulas and symbols pertaining to the basic profile and the design profiles are given in Section 10.

3 SCREW THREAD SERIES

3.1 Thread Series Definition

Thread series are groups of diameter–pitch combinations distinguished from each other by the number of threads per inch applied to a series of specific diameters. There are two general series classifications: standard and special.

3.1.1 Standard Series. The standard series consists of three series with graded pitches (coarse, fine, and extra fine) and eight series with constant pitches (4, 6, 8, 12, 16, 20, 28, and 32 threads per inch). The standard series is shown in Table 2. Limits of size are shown in Table 3A. See Section 8 for limits of size.

3.1.2 Special Series. The special series consists of all threads with diameter–pitch combinations that are not included in the standard series. When allowances and tolerances of special series threads are derived from unified formulation as shown in Section 5, the threads are designated UNS or UNRS. Limits of size for selected combinations of UNS/UNRS threads are shown in Table 3B. If allowance and tolerance are not derived from unified formulation, the threads are designated special. See Section 6 for details of designation.

3.2 Order of Selection

Wherever possible, selection should be made from Table 3A, Standard Series—Unified Screw Threads, preference being given to the coarse and fine thread series. If threads in the standard series do not meet the requirements of design, reference should be made to the selected combinations in Table 3B. The third expedient is to design UNS/UNRS threads using tables of allowance and tolerance in Sections 12 and 13. The last resort is to design special threads and use the formulas for limits of size in Section 8.

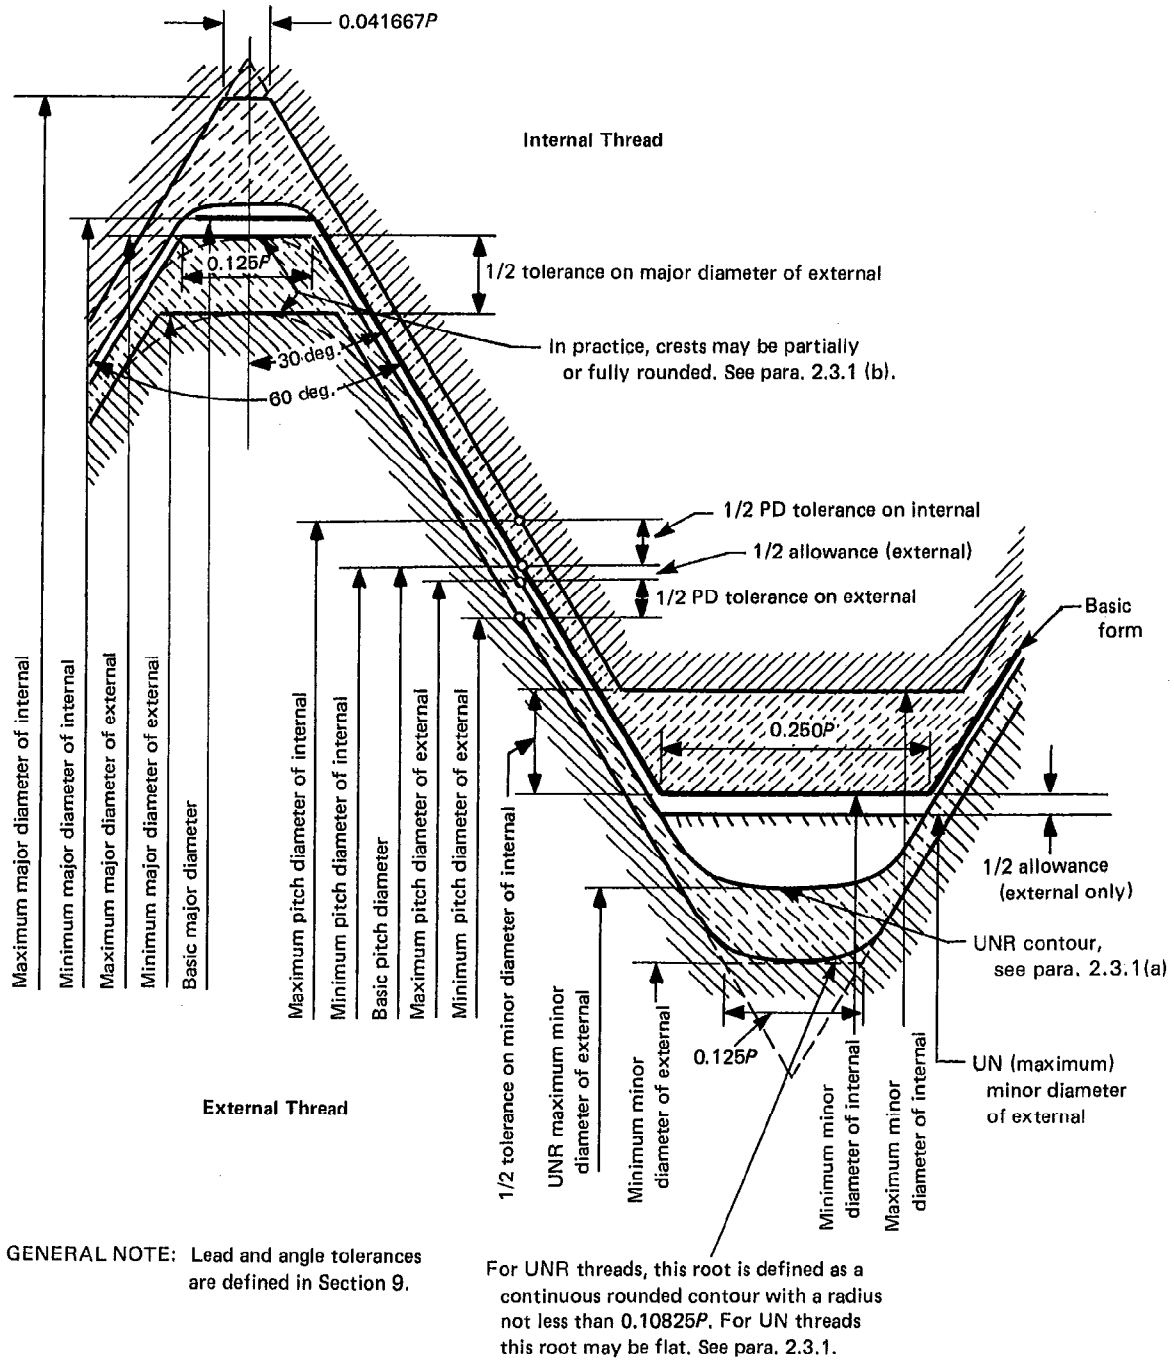
3.3 Coarse Thread Series Applications

The coarse thread series (UNC/UNRC) is generally used for the bulk production of screws, bolts, and nuts. It is commonly used in relatively low strength materials such as cast iron, aluminum, magnesium, brass, bronze, and plastic, because the coarse series threads provide more resistance to internal thread stripping than the fine or extra-fine series. Coarse series threads are advantageous where rapid assembly or disassembly is required, or if corrosion or damage from nicks due to handling or use is likely.

3.4 Fine Thread Series Applications

The fine thread series (UNF/UNRF) is commonly used for bolts and nuts in high strength applications. This series has less thread depth and a larger minor diameter than coarse series threads. Consequently, thinner walls are permitted for internal threads and

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:08 2005



GENERAL NOTE: Lead and angle tolerances are defined in Section 9.

For UNR threads, this root is defined as a continuous rounded contour with a radius not less than 0.10825*P*. For UN threads this root may be flat. See para. 2.3.1.

FIG. 2 DISPOSITION OF DIAMETRAL TOLERANCES, ALLOWANCE, AND CREST CLEARANCE FOR UNIFIED INCH SCREW THREAD CLASSES 1A, 2A, 1B, AND 2B

GENERAL NOTE: Lead and angle tolerances are defined in Section 9.

FIG. 3 DISPOSITION OF DIAMETRAL TOLERANCES AND CREST CLEARANCES FOR UNIFIED INCH SCREW THREAD CLASSES 3A AND 3B

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:09 2005

more strength is available to external threads than for coarse series threads of the same nominal size. In order to prevent internal thread stripping, a longer length of engagement is required for fine series than for coarse series threads for thread materials of the same strength levels. However, for both fine and coarse series threads, length of engagement in tapped holes must be selected to meet strength requirements. Fine series threads have less tendency to loosen under vibration than coarse series threads, because of the smaller lead angle. This also allows for finer adjustment in cases such as a slotted nut and cotter pin assembly.

3.5 Extra-Fine Thread Series Applications

The extra-fine series (UNEF/UNREF) is used particularly for equipment and threaded parts that require fine adjustment, such as bearing retaining nuts, adjusting screws, etc., and for thin-wall tubing and thin nuts.

3.6 Constant-Pitch Thread Series Applications

The various constant-pitch series (UN/UNR) with 4, 6, 8, 12, 16, 20, 28, and 32 threads per inch, given in Table 2, offer a comprehensive range of diameter–pitch combinations for those purposes where the threads in the coarse, fine, and extra-fine series do not meet the particular requirements of the design. The primary sizes of the 8-UN, 12-UN, and 16-UN series shown in Table 2 are the most commonly used.

Whenever a thread in a constant-pitch series also appears in the UNC, UNF, or UNEF series, the symbols and tolerances for limits of size of those standard series are applicable.

3.6.1 8-Thread Series. The 8-thread series (8-UN) is a uniform-pitch series for large diameters or as a compromise between coarse and fine thread series. Although originally intended for high-pressure-joint bolts and nuts, it is now widely used as a substitute for the coarse thread series for diameters larger than 1 in.

3.6.2 12-Thread Series. The 12-thread series (12-UN) is a uniform-pitch series for large diameters requiring threads of medium-fine pitch. Although originally intended for boiler practice, it is now used as a continuation of the fine thread series for diameters larger than 1½ in.

3.6.3 16-Thread Series. The 16-thread series (16-UN) is a uniform-pitch series for large diameters requiring fine-pitch threads. It is suitable for adjusting collars and retaining nuts and also serves as a continuation of the extra-fine thread series for diameters larger than $1\frac{11}{16}$ in.

3.7 Fine Threads for Thin-Wall Tubing

The limits of size for a 27-thread series, ranging from ¼ to 1 in. nominal size, are included in Table 3B. These threads are recommended for general use on thin-wall tubing. The minimum length of complete thread shall be one-third of the basic major diameter plus five threads ($D/3 + 0.185$).

4 SCREW THREAD CLASSES

4.1 Thread Classes

Thread classes are distinguished from each other by the amounts of tolerance and allowance. Classes 1A, 2A, and 3A apply to external threads only, and Classes 1B, 2B, and 3B apply to internal threads only. Allowance is specified only for Classes 1A and 2A and the allowance is identical for both classes. Tolerance decreases as class number increases (e.g., tolerance for Class 3A is less than that for Class 2A, which is less than that for Class 1A).

4.1.1 Class 2A and 2B Threads. Class 2A (external) and Class 2B (internal) threads are the most commonly used thread classes for general applications, including production of bolts, screws, nuts, and similar threaded fasteners.

The maximum diameters of Class 2A uncoated threads are less than basic by the amount of the allowance. The allowance minimizes galling and seizing in high-cycle wrench assembly, or it can be used to accommodate plated finishes or other coating. However, for threads with additive finish, the maximum diameters of Class 2A may be exceeded by the amount of the allowance; i.e., the 2A maximum diameters apply to an unplated part or to a part before plating, whereas the basic diameters (the 2A maximum diameter plus allowance) apply to a part after plating. The minimum diameters of Class 2B threads, whether or not plated or coated, are basic, affording no allowance or clearance in assembly at maximum-material limits.

4.1.2 Class 3A and 3B Threads. Class 3A (external) and Class 3B (internal) threads provide for applications where closeness of fit and/or accuracy of thread elements are important. The maximum diameters of Class 3A threads and the minimum di-

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:10 2005

ameters of Class 3B threads, whether or not plated or coated, are basic, affording no allowance or clearance for assembly at maximum-material limits.

4.1.3 Class 1A and 1B Threads. Class 1A (external) and Class 1B (internal) threads replaced American National Class 1 screw threads. These classes provide for applications where a liberal tolerance and an allowance are required to permit easy assembly even with slightly nicked threads. These classes are intended for ordnance and other special uses. Maximum diameters of Class 1A threads are less than basic by the amount of the allowance (the allowance is identical to that for Class 2A). The allowance is not available for plating or coating and, consequently, in some cases it may be necessary to make special provisions in thread manufacturing for accommodation of plating or coating. The minimum diameters of Class 1B threads, whether or not plated or coated, are basic and consequently afford no allowance or clearance for assembly at maximum-material limits.

4.1.4 Class 2AG Threads. Certain applications require an allowance for rapid assembly to permit application of the proper lubricant or for residual growth due to high-temperature expansion. In these applications, when the thread is coated and the 2A allowance is not permitted to be consumed by such coating, the thread class symbol is qualified by the addition of the letter G (old symbol for allowance) following the class symbol. Refer to paras. 6.2.1, 7.1, and 7.3 for more detailed information.

4.2 Combinations of Classes

The requirements for screw thread fits for specific applications are predicated on end use and can be met by specifying the proper combinations of thread classes for the components. For example, a Class 2A external thread may be used with a Class 1B, 2B, or 3B internal thread.

5 SCREW THREAD ALLOWANCE AND TOLERANCE

5.1 Allowance

Allowance is specified only for Class 1A and 2A external threads. For Class 1A threads, its purpose is to preclude the possibility of surface-to-surface fit between mating parts and it cannot be used to accommodate plating or coating. For Class 2A threads, the allowance may be used to accommodate plating or coating. Allowance for Classes 1A and 2A is identical and is based on Class 2A pitch diameter tolerance for the respective series standard length of engagement and is applicable for all lengths of engagement.

Formulas for allowance are given in para. 5.8.1(a) and values are given in Sections 12 and 13.

Applications of allowances to the basic thread form are shown in Fig. 2.

EXAMPLE: 2.0625-12UNS-2A
From para. 5.8.1(a): Allowance $es = 0.300\ Td_2(2A)$.
From para. 5.2, example (1): $Td_2(2A) = 0.0061$.
Therefore, $es = 0.300 \times 0.0061 = 0.00183$, or 0.0018 in. when rounded.

5.2 Pitch Diameter Tolerance, All Classes

NOTE: Refer to Table 2 for the standard series of diameter–pitch combinations. Allowances and tolerances for standard series threads are applied in Table 3A. All other diameter–pitch combinations are considered nonstandard. Allowances and tolerances for a selection of nonstandard threads are applied in Table 3B.

The pitch diameter tolerances specified in Table 3A for all classes of the UNC and UNF series are based on a length of engagement equal to the basic major (nominal) diameter and are applicable for lengths of engagement from five pitches to up to 1½ diameters. For the 4-UN, 6-UN, and 8-UN series, the pitch diameter tolerances specified for Classes 2A, 2B, 3A, and 3B are based on a length of engagement equal to the basic major (nominal) diameter and are applicable for lengths of engagement up to 1½ diameters.

The pitch diameter tolerances specified in Table 3A for all classes of the UNEF, 12-UN, 16-UN, 20-UN, 28-UN, and 32-UN series are based on a length of engagement of 9 pitches and are applicable for lengths of engagement from 5 to 15 pitches.

The pitch diameter tolerances specified in Table 3B for all classes of the UNS series are based on a length of engagement of 9 pitches and are applicable for lengths of engagement from 5 to 15 pitches.

Formulas for pitch diameter tolerance are given in paras. 5.8.1(c) and 5.8.2(b), and values are given in Sections 12 and 13.

Applications of tolerances to the thread form are shown in Figs. 2 and 3.

For special threads not included in Table 3B, the tolerances and allowances should be obtained from the tabulated tolerances or increments for special threads, if applicable, or computed from the formula values for standard lengths of engagement. For lengths of engagement over 15 to and including 30

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:10 2005

pitches, the pitch diameter tolerances are 1.25 times the formula values; and for lengths of engagement over 30 pitches, the tolerances are 1.50 times the formula values.

EXAMPLES:
(1) 2.0625-12UNS-2A; LE = 1 in. (12 pitches).
Use Table 34 column for major diameter of 1.875 through 2.25. Read pitch diameter tolerance Td_2(2A) in 12 threads per inch row for length of engagement LE equal to 0.42 to 1.25 in. (5 to 15 pitches). Td_2 = 0.0061 in.
(2) 6.500-5UNS-SE2B; LE = 4 in. (20 pitches).
From para. 5.8.2(b): TD_2(2B) = 1.300 Td_2(2A). Use Table 19 for Td_2(2A), since 5 TPI is not tabulated in Table 37.

Increment D (not tabulated) = 0.0015 $\sqrt[3]{D}$	= 0.002799
Increment LE (9 pitches)	= 0.002012
Increment P	= 0.005130
Td_2(2A) for $LE = 9P$	= 0.009941
TD_2(2B) for $LE = 9P$ = 1.300 Td_2(2A)	= 0.012923
TD_2(2B) for $LE = 20P$ = 1.25 TD_2(2B)	= 0.016154

or 0.0162 in. when rounded.

5.3 Special Lengths of Engagement *LE*

For special applications, the required length of engagement might be the determining factor in the proper selection of thread tolerances. When design considerations require nonstandard pitches or extreme conditions of engagement not covered by the tables, the tolerances may be modified as explained below or calculated using the formulas.

It is particularly important that this increase in tolerance be noted by the user for external threads (Class 3A) callout. At times it is impossible for the producer to know the length of engagement with an internally threaded member. It may be necessary for the producer to lower the maximum values of pitch diameter when making such externally threaded components. Hence the increased tolerance noted.

5.3.1 Long *LE* Using Gage Length *LG* Equal to *LE*

(a) For engagement lengths exceeding 1.5 diameters, for UNC, UNF, 4-UN, 6-UN, and 8-UN series, the pitch diameter tolerances shown in Table 3A should be increased as follows.

(1) For lengths of engagement over 1.5 to and including 3 diameters, the pitch diameter tolerances are 1.25 times the values for the standard lengths of engagement shown in Table 3A.

(2) For lengths of engagement over 3 diameters, the tolerances are 1.50 times the values shown in Table 3A.

EXAMPLE:
0.500-13UNC-SE2B; LE = 1 in. (2 diameters).
From Table 3A or Table 20: TD_2 = 0.0065.
TD_2 for LE of 2 diameters = 1.25 Td_2 standard
= 1.25 × 0.0065
= 0.0081 in.

(b) For engagement lengths exceeding 15 pitches, for UNEF, 12-UN, 16-UN, 20-UN, 28-UN, and 32-UN series, and for UNS threads in Table 3B, the pitch diameter tolerances shown in Tables 3A and 3B, as applicable, should be increased as follows.

(1) For lengths of engagement over 15 to and including 30 pitches, the pitch diameter tolerances are 1.25 times the values for the standard lengths of engagement shown in Tables 3A and 3B, as applicable.

(2) For lengths of engagement over 30 pitches, the tolerances are 1.50 times the values shown in Tables 3A and 3B, as applicable.

EXAMPLE:
1.5000-28UN-SE2A; LE = 2 in. (56 pitches).
From Table 3A or Table 29: Td_2 = 0.0042 for standard length of engagement.
Td_2 for LE = 56 pitches = 1.50 Td_2 standard
= 1.50 × 0.0042
= 0.0063 in.

NOTE: See example in para. 5.3.1(c).

(c) Major Diameter Tolerance and Length of Engagement for External Threads, All Classes. External thread major diameter tolerances are based on pitch only and are applicable for all lengths of engagement, with this exception: where the external thread pitch diameter tolerance for long lengths of engagement exceeds 0.9 times the major diameter tolerance, the latter should be increased to 1.10 times the adjusted pitch diameter tolerance.

Formulas for the major diameter tolerance for external threads are given in para. 5.8.1(b) and values are given in Sections 12 and 13.

EXAMPLE:
1.5000-28UN-SE2A; LE = 2 in. (56 pitches).
From the example in para. 5.3.1(b), Td_2 = 0.0063.
From Table 29, Td = 0.0065, so Td_2 = 0.969 Td. Therefore, Td must be adjusted to 1.10 Td_2.
Adjusted Td = 1.10 × 0.0063 = 0.0069 in.

(d) High Strength Materials Using Standard Pitch Diameter Tolerances. For applications of long length of engagement of mating parts involving very high strength materials, increases in tolerances based on standard length of engagement may be detrimental. In these cases, the tolerances based on the standard

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:10 2005

length of engagement may be applied to increased length of engagement threads. This requires the GO thread gages to have a special length equal to the length of engagement.

(e) Standard Bolt, Added Allowance in Tapped Hole, EI Increases. In some cases where greater than standard length of engagement is required, it is desirable to use standard externally threaded parts with tolerances based on standard length of engagement. For example, in the case of a standard bolt assembled into a tapped hole in aluminum, the designation of the bolt thread will conform to that of a thread for a standard length of engagement.

To assure proper assembly, the tapped hole thread into which the bolt is assembled must not interfere with the bolt thread. This could happen if no special provision were made in the tapped hole thread due to the cumulative effect of lead variation on the bolt thread, inasmuch as the increased length of engagement exceeds the thickness of the GO thread gage used for acceptance of the bolt thread. To avoid this condition, an allowance should be provided in the tapped hole, the amount of which should be the diameter equivalent of the cumulative lead variation for the increased length of engagement, which is one-half the pitch diameter tolerance of the bolt thread allowed for the standard length of engagement. This requires the GO thread and GO plain gages to have a special length equal to the length of engagement.

EXAMPLE:
0.5000-13UNC-SE2B; LE = 1 in. (2 diameters); assembled with standard bolt thread.
Add allowance $EI = {}^1/_2Td_2$ for standard bolt thread. From Table 4, column 5, ${}^1/_2Td_2$ (standard) = 0.0025. Therefore, the thread is redesignated to indicate a nonstandard internal thread with the allowance of 0.0025 added to the basic size of 0.5000. New designation is 0.5025-13UNS-SE2B. Allowance is also added to the standard minor diameter size limits and to the adjusted pitch diameter size limits. See paras. 5.3.1(a) and 6.6.1.

(f) Standard Internal Thread, Added Allowance on External Thread, es Increases. In some cases where greater than standard length of engagement is required, it is desirable to use standard internally threaded parts with tolerances based on standard length of engagement.

The threaded rod onto which a standard clevis yoke is assembled must not interfere with the clevis yoke thread, since standard clevis yokes have extra internal threads. An allowance should be provided on the rod thread, the amount of which should be the diameter equivalent of the cumulative lead variation for the increased length of engagement, which is one-half the pitch diameter tolerance of clevis yoke thread allowed for the standard length of engagement. The major diameter tolerance is not increased. This requires the GO thread and GO plain gages to have a special length equal to the length of engagement.

EXAMPLE:
0.3750-24UNF-SE2A; LE = 0.88 in. (2.35 diameters); assembled with standard internal thread.
Add allowance, equal to ${}^1/_2TD_2$ for standard internal thread. From Table 4, column 8, ${}^1/_2TD_2$ (standard) = 0.00245, which is rounded to 0.0025. Therefore, the thread is redesignated to indicate a nonstandard external thread with the allowance of 0.0025 subtracted from the basic size of 0.3750. New designation is 0.3725-24UNS-SE2A. The added allowance is also subtracted from the standard major diameter size limits and from the adjusted pitch diameter size limits. See paras. 5.3.1(a) and 6.6.1.

5.3.2 Long Length of Engagement Using Standard Thread Gage Limits. ANSI/ASME B1.2 recommends that the length of the GO gage should approximate the length of engagement. However, it is sometimes more economical to accept these threads with GO thread gages made from standard gage blanks which have length approximating the standard lengths of engagement.

NOTE: When this is done, additional precautions are necessary to determine the effect of cumulative variation of lead and straightness of thread axis due to a long length of engagement.

If applicable, an additional allowance should be provided, preferably on the external thread, the amount of which should be the diameter equivalent of the cumulative lead variation for the increased length of engagement, equal to the sum of one-half the pitch diameter tolerances of the external and internal threads allowed for the standard length of engagement.

EXAMPLE:
0.3750-24UNF-2A; LE = 0.88 in. (2.35 diameters); with external and internal thread gages of standard length.
Add allowance equal to ${}^1/_2Td_2 + {}^1/_2TD_2$ for standard mating threads. From Table 4, column 5, ${}^1/_2Td_2$ (standard) = 0.0019.
From Table 4, column 8, ${}^1/_2TD_2$ (standard) = 0.00245.
The sum of these, after rounding, is equal to 0.0044, which is the added allowance. Therefore, the thread is redesignated to indicate a nonstandard external thread, with the allowance of 0.0044 subtracted from the basic size of 0.3750. New designation is 0.3706-24UNS-2A. The added allowance is also subtracted from the standard major diameter and pitch diameter size limits. See para. 6.6.2.

5.4 Minor Diameter Tolerance and Allowance for External Threads

The tolerance for minor diameter is for reference only. In dimensioning external threads, the minimum minor diameter is not specified, being established by the crest of an unworn tool. In practice, the minor diameter of an external thread is satisfactory when

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:11 2005

ASME B1.1 89 ■ 0759670 0039711 4 ■

accepted by a gage or gaging method that represents the maximum-material condition of the internal thread less the allowance *es*, if any. A formula for the minor diameter tolerance of external threads is given in para. 5.8.1(d).

5.5 Major Diameter Tolerance for Internal Threads

The tolerance for major diameter is for reference only. In dimensioning internal threads, the maximum major diameter is not specified, being established by the crest of an unworn tool. In practice, the major diameter of an internal thread is satisfactory when accepted by a gage or gaging method that represents the maximum-material condition of an external thread which has no allowance. A formula for the major diameter tolerance of internal threads is given in para. 5.8.2(a).

5.6 Minor Diameter Tolerance and Length of Engagement for Internal Threads

Formulas for the minor diameter tolerance for internal threads are given in para. 5.8.2(c) and values are given in Sections 12 and 13.

Internal thread minor diameter tolerances are suitable for lengths of engagement up to 1.5 diameters. For applications having shorter or longer lengths of engagement, it may be advantageous to decrease or increase the tolerance as explained below.

5.6.1 The principal practical factors which govern minor diameter tolerance are ease of tapping, standard drill sizes, and height of engagement.

NOTE: Height of engagement is measured in a radial direction, while length of engagement is measured in an axial direction.

Height of engagement correlates with the stripping strength of the thread assembly and, therefore, also with the length of engagement. It also correlates with the tendency toward disengagement of the threads on one side when assembly is eccentric. The amount of possible eccentricity is one-half of the sum of the allowance and pitch diameter tolerances on both mating threads. For a given pitch, or height of thread, this sum increases with the diameter, and accordingly, this factor would require a decrease in minor diameter tolerance with an increase in thread diameter. However, such a decrease in tolerance often is not feasible without requiring special drill sizes; therefore, to be able to use as many as possible of the available standard drill sizes listed in ANSI B94.11M, the minor diameter tolerance for Classes 1B and 2B of a given pitch for ¼ in. diameter and larger is constant.

There may be applications where the lengths of engagement of the mating threads or the combination of materials used for mating threads are such that the maximum tolerance may not provide the desired strength of the fastening. Experience has shown that for lengths of engagement less than 0.67*D* (the minimum thickness of standard nuts), the minor diameter tolerance may be reduced without causing tapping difficulties.

In other applications, the length of engagement of mating threads may be long because of design considerations or the combination of materials used for mating threads. As the threads engaged increase in number, their height of engagement may be shallower and still develop stripping strength greater than the external thread breaking strength. In these cases, the maximum tolerance should be increased to reduce the possibility of tapping difficulties.

It is particularly important to reduce the number of minor diameter tolerances to a practical minimum. This reduction is usually obvious to the producer of longer internally threaded components, but sometimes is not understood by the user. Tolerances for all recommended diameters, lengths of engagement, and selected pitches are given in Table 39 for Classes 1B and 2B, and in Table 40 for Class 3B.

In these Tables, the tolerances for lengths of engagement less than 0.33*D* are 0.50 times the formula values. For lengths of engagement from 0.33*D* to 0.67*D*, the tolerances are 0.75 times the formula values; for lengths of engagement from 0.67*D* to 1.5*D*, the tolerances are equal to the formula values; and for lengths of engagement over 1.5*D*, the tolerances are 1.25 times the formula values. Where the tolerance value so computed is more than 0.394*P*, which corresponds to a resulting minimum thread height of 53%, the value is adjusted to equal 0.394*P*.

5.7 Disposition of Allowance and Tolerance

The disposition of allowance, tolerance, and crest clearances for the various thread classes is shown in Figs. 2 and 3.

5.8 Formulas for Allowance and Tolerance

The following formulas for allowance and tolerance are used for unified formulation and apply to standard and special series screw threads.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:12 2005

The following symbols are used in the equations.

D = basic major (nominal) diameter
LE = length of engagement, in.
P = pitch, in. = $1/n$
H = height of fundamental triangle = $0.866025P$
n = threads per inch

5.8.1 External Thread

(a) Allowance (External Threads)

(1) Classes 1A and 2A = 0.300 Class 2A pitch diameter tolerance

(2) Class 3A = no allowance

(b) Major Diameter Tolerance (External Threads)

(1) Class 1A = $0.090\sqrt[3]{P^2}$

(2) Classes 2A and 3A = $0.060\sqrt[3]{P^2}$

The tolerance for Class 2A coarse and the 8-thread series threads of unfinished, hot-rolled material is $0.090\sqrt[3]{P^2}$. This does not apply to standard fasteners with rolled threads.

(c) Pitch Diameter Tolerance (External Threads)

(1) Class 1A = 1.500 Class 2A pitch diameter tolerance

(2) Class 2A[1] = $0.0015\sqrt[3]{D} + 0.0015\sqrt{LE} + 0.015\sqrt[3]{P^2}$

(3) Class 3A = 0.750 Class 2A pitch diameter tolerance

(d) Minor Diameter Tolerance (External Threads)

(1) UNR Classes. To intersection of rounded root with its centerline (see Figs. 2 and 3), equals pitch diameter tolerance for class of thread specified, plus $H/8$ (see Table 6).

(2) UN Classes 1A, 2A, and 3A. To intersection of flat root with flanks of threads (see Figs. 2 and 3), equals pitch diameter tolerance for class of thread specified, plus $H/4$ (see Table 6).

5.8.2 Internal Thread

(a) Major Diameter Tolerance (Internal Threads). For Classes 1B, 2B, and 3B, equals $H/6$ plus the pitch diameter tolerance of the class of thread under consideration.

(b) Pitch Diameter Tolerance (Internal Threads)

(1) Class 1B = 1.950 Class 2A pitch diameter tolerance (1.5 Class 2B)

(2) Class 2B = 1.300 Class 2A pitch diameter tolerance

(3) Class 3B = 0.975 Class 2A pitch diameter tolerance (0.750 Class 2B)

(c) Minor Diameter Tolerance (Internal Threads)

(1) Classes 1B and 2B. For all thread series and special threads in sizes less than ¼ in., equals $[0.05\sqrt[3]{P^2} + 0.03P/D] - 0.002$ in., within the following limitations.

(a) Tolerances shall not be greater than $0.394P$. (This corresponds to 53% of the thread[2] and applies in the range of the smallest number sizes of the UNC and UNF thread series.)

(b) Tolerances shall not be less than $0.25P - 0.4P^2$. (This corresponds to a thread[2] of 65% for 80 to 24 threads per inch.)

The formulas are suitable for general applications having lengths of engagement up to 1.5 diameters.

For all thread series and special threads ¼ in. and larger, 80 to 4 threads per inch, inclusive, equals $0.25P - 0.4P^2$. (This corresponds to a thread[2] of 64.5% for 80 threads per inch graduating to 71.8% for 4 threads per inch.) For all thread series and special threads ¼ in. and larger with less than 4 threads per inch, equals $0.15P$.

(2) Class 3B. For all thread series, equals $[0.05\sqrt[3]{P^2} + 0.03P/D] - 0.002$ in., within the following limitations.

(a) Tolerance shall not be greater than $0.394P$. (This corresponds to 53% of the thread[2] and applies in the range of the smallest numbered sizes of the UNC and UNF thread series.)

(b) Tolerance shall not be less than:

(1) for 80 to 13 threads per inch, inclusive, $0.23P - 1.5P^2$. (This corresponds to a thread[2] of 67% for 80 threads per inch, graduating to 74% for 13 threads per inch.)

(2) for 12 threads per inch and coarser, $0.120P$. (This corresponds to a thread[2] of 74% and is the tolerance for all sizes 12 threads and coarser and 1 in. and larger.)

The formulas are suitable for general applications having lengths of engagement up to 1.5 diameters.

5.9 Circular Runout

Circular runout is the full indicator movement (see ANSI Y14.5M).

5.9.1 Internal Thread. When measurement is specified, the runout of the minor diameter cylinder with the pitch diameter cylinder on the internal thread shall not exceed its pitch diameter tolerance.

[1]See Table 19 for values of these terms corresponding to given values of diameter, length of engagement, and pitch.

[2]The percent of thread is based on the "old symmetrical" thread height of $0.64952P$. See Table 6, column 13.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:12 2005

5.9.2 External Thread. When measurement is specified, the runout of the major diameter cylinder with the pitch diameter cylinder on the external thread shall not exceed its pitch diameter tolerance.

5.10 Lead and Flank Angle Tolerances

See Section 9.

5.11 Coated or Plated Threads

See Section 7 for dimensional accommodation and limits for coated threads.

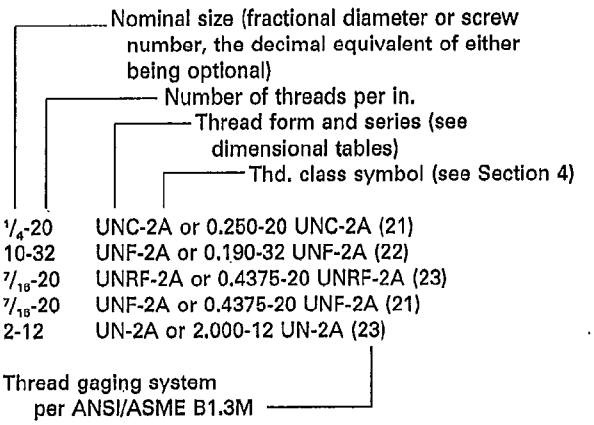
6 SCREW THREAD DESIGNATION

6.1 Basic Method of Designating

The basic method of designating a screw thread is used where the standard tolerances or limits of size based on the standard length of engagement are applicable, as indicated in Section 5.

The designation specifies in sequence the nominal size, number of threads per inch, thread series symbol, thread class symbol, and gaging system per ANSI/ASME B1.3M (see Fig. 4). The nominal size is the basic major diameter and is specified as the fractional diameter, screw number, or their decimal equivalent. Where decimal equivalents are used for size callout, they shall be shown in four place decimals (omitting the cipher in the fourth place) for fractional sizes, and in three place decimals for number sizes. They shall be interpreted as being nominal size designations only and shall have no dimensional significance beyond the fractional size or number designation. The thread series symbol indicates the thread form (refer to Section 2), series, and tolerance formulation (refer to Section 3). The thread series symbols for the UN thread form are UNC, UNF, UNEF, or UN for only those sizes of the various series shown in Table 2 and UNS for any other intermediate and larger size diameter–pitch combination having tolerances to unified formulation. The corresponding thread series symbols for the UNR thread form are UNRC, UNRF, UNREF, or UNR. The symbol UNRS corresponds to UNS. The thread class symbols are 1A, 1B, 2A, 2B, 3A, or 3B, where the suffixes A and B relate to external and internal threads, respectively.

UNS threads and threads having special length of engagement require certain additional information as shown in paras. 6.4 and 6.6.



GENERAL NOTE:
Thread acceptability gaging system requirement of ANSI/ASME B1.3M may be added to the thread size designation as noted above or as specified in pertinent documentation, such as drawing or procurement document.

FIG. 4 SCREW THREAD DESIGNATIONS

6.2 Method of Designating Coated Threads

Specification on drawings of the before and after coating dimensions for screw threads is sometimes dictated by an engineering or production consideration that the size before and after coating be controlled. This results from coated screw threads having two stages of design — the before coating stage and the after coating stage. The threaded product may be produced by a supplier and coated by a user. In this case, it is necessary that a clear understanding of the coating requirements and the allowance for coating buildup be agreed upon by both supplier and user (see Section 7).

The before coating (plating) dimensions have a definite bearing on the strength of the screw threads. The before coating stage is, therefore, decidedly an engineering consideration; it is also a production consideration in requiring that proper allowance be made for the specified coating thickness. The finished parts should be of a size after coating that will allow them to be assembled with their coating components as intended.

Recommended methods for designating coated thread under various conditions are described in the following paragraph.

6.2.1 For coated (or plated) Class 2A external threads, the basic (max.) major and basic (max.) pitch diameters shall be given, followed by the words

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:12 2005

AFTER COATING. The major and pitch diameter limits of size before coating shall also be given, followed by the words BEFORE COATING.

EXAMPLE:
$^3/_4$-10 UNC-2A (21)
Major diam. 0.7500 max. } AFTER
PD 0.6850 max.[3] } COATING

Major diam. 0.7482–0.7353 } BEFORE
PD 0.6832–0.6773[4] } COATING

Certain applications require an allowance for rapid assembly to permit application of the proper lubricant or for residual growth due to high-temperature expansion. In these applications, when the thread is coated and 2A allowance is not permitted to be consumed by such coating, the thread class symbol is qualified by the addition of the letter G (old symbol for allowance) following the class symbol; the maximum major and maximum pitch diameters are reduced below basic size by the amount of the 2A allowance and followed by the words AFTER COATING, thereby insuring that the allowance is maintained. The thread before coating must have special provisions to allow for coating thickness. The major and pitch diameter limits of size before coating (calculated in accordance with Section 7) shall also be given, followed by the letters SPL (special) and by the words BEFORE COATING.

EXAMPLE:
$^3/_4$-10 UNC-2AG (22)
Major diam. 0.7482 max. } AFTER
PD 0.6832 max.[4] } COATING

Major diam. 0.7464–0.7335 SPL } BEFORE
PD 0.6814–0.6755 SPL[5] } COATING

Threads accepted to Class 2A limits before coating are accepted after coating by basic size Class 3A GO thread gages. The allowance given in the dimensional tables for Class 2A thread is sufficient to allow for a limited amount of coating as described in Section 7. However, if a greater coating thickness is required, it will be necessary to calculate the before coating limits in accordance with Section 7.

6.2.2 For coated (or plated) Class 3A external threads, the maximum major and maximum pitch diameters may optionally be given, followed by the words AFTER COATING, thereby indicating that the thread before coating must have special provisions to allow for coating thickness. The major and pitch diameter limits of size before coating (calculated in accordance with para. 7.5) shall be given, followed by the letters SPL (special) and by the words BEFORE COATING.

EXAMPLE: Thickness of coating 0.0002 in. to 0.0003 in.
$^1/_4$-28 UNF-3A (21)
Major diam. 0.2500 max. } AFTER COATING
PD 0.2268 max.[6] } (Optional)

Major diam. 0.2494–0.2431 SPL } BEFORE
PD 0.2256–0.2235 SPL } COATING

6.2.3 For coated (or plated) Class 1A external threads, the maximum major and maximum pitch diameters may optionally be given, followed by the words AFTER COATING, thereby indicating that the thread before coating must have special provisions to allow for coating thickness. The major and pitch diameter limits of size before coating (calculated in accordance with para. 7.5) shall be given, followed by the letters SPL (special) and by the words BEFORE COATING.

EXAMPLE: Thickness of coating 0.0002 in. to 0.0003 in.
$^1/_4$-20 UNC-1A (21)
Major diam. 0.2489 max. } AFTER COATING
PD 0.2164 max.[7] } (Optional)

Major diam. 0.2483–0.2363 SPL } BEFORE
PD 0.2152–0.2100 SPL[8] } COATING

6.2.4 Where an allowance is required to accommodate coating (or plating) on Class 1B, 2B, or 3B internal threads, the minimum minor and minimum pitch diameters may optionally be given, followed by the words AFTER COATING. The minor and pitch diameter limits of size before coating (calculated in accordance with para. 7.6) shall be given, followed by the letters SPL (special) and by the words BEFORE COATING.

EXAMPLES: Thickness of coating 0.0002 in. to 0.0003 in.
$^1/_4$-20 UNC-1B (21)
Minor diam. 0.196 min. } AFTER COATING
PD 0.2175 min. } (Optional)

Minor diam. 0.197–0.207 SPL } BEFORE
PD 0.2187–0.2256 SPL } COATING

[3]Major and PD values are equal to basic and correspond to those in Table 3A for Class 3A.

[4]Major and PD limits are those in Table 3A for Class 2A.

[5]Major and PD limits correspond to those in Table 3A for Class 2A minus the coating allowance.

[6]Major and PD limits are those in Table 3A for Class 3A.

[7]Major and PD limits are those in Table 3A for Class 1A.

[8]Major and PD limits correspond to those in Table 3A for Class 1A minus the coating allowance.

Minor diam. 0.643–0.663 SPL } BEFORE
PD 0.6862–0.6935 SPL } COATING

$^{1}/_{4}$-28 UNF-3B (23)
Minor diam. 0.2110 min. } AFTER COATING
PD 0.2268 min. } (Optional)

Minor diam. 0.2116–0.2194 SPL } BEFORE
PD 0.2280–0.2308 SPL } COATING

NOTE: The after coating limits for all of the examples above are the minor and PD values in Table 3A for the respective class of thread.

6.3 Method of Designating Left-Hand Threads

Unless otherwise specified, threads are right hand; a left-hand thread shall be designated LH as follows.

EXAMPLE:
$^{1}/_{4}$-20 UNC-3A-LH (21)

6.4 Method of Designating UNS Threads

UNS threads are special combinations of diameter and pitch with tolerance to unified formulation.

UNS threads have the basic form of designation set out above, supplemented always by the limits of size.

EXAMPLES:
$^{1}/_{4}$-24 UNS-3A (21)
Major diam. 0.2500–0.2428
PD 0.2229–0.2201
Minor diam. 0.205 max.

0.495-20 UNS-3A (21)
Major diam. 0.4950–0.4869
PD 0.4625–0.4593
Minor diam. 0.441 max.

1.200-10 UNS-2B (21)
Minor diam. 1.092–1.113
PD 1.1350–1.1432
Major diam. 1.200 min.

6.5 Designations for Other Threads

Threads having tolerances that do not conform to unified formulation and threads having multiple start or lead, or special form, also require additional considerations in the thread designation. The recommended methods of designating these threads are described in the following paragraphs.

6.5.1 Method of Designating Threads Having Tolerances Not to Unified Formulation. If a standard series thread is altered in any respect other than revised pitch diameter limits for a special length of engagement, the modification of crests, or the adjustment of the limits of size to accommodate coating, as shown above, it is designated in accordance with the following.

EXAMPLES:
$^{7}/_{16}$-24 Unified Form SPL-EXT[9] (22)
Major diam. 0.4340–0.4280 SPL
PD 0.4065–0.4025 SPL
Minor diam. 0.3889 max.
LE 0.38

$^{1}/_{2}$-13 Unified Form SPL-INT[9] (22)
Minor diam. 0.424–0.434 SPL
PD 0.4500–0.4580 SPL
Major diam. 0.5000 min.
LE 0.50

6.5.2 Method of Designating Multiple Start Threads. If a thread is required with a multiple start or lead, it is designated by specifying in sequence the nominal size, pitch (in decimals or threads per inch), and lead (in decimals or fractions) as follows.

EXAMPLE:
$^{3}/_{4}$-0.0625*P*-0.1875*L* Unified Form SPL-EXT[9] (23)
Major diam. 0.7485–0.7391
PD 0.7079–0.7003 SPL
Minor diam. 0.6808 max.
LE 0.75

6.5.3 Method of Designating Special Form Threads. If a thread for design consideration requires a variation from unified standard thread contour and is not covered by another recognized standard, such as when the detail of the root differs from that for the standard thread form, the designation shall not include either the letters "UN" or the word "UNIFIED," but shall be as follows.

EXAMPLE:
$^{7}/_{8}$-18 SPL 60 deg. Form-EXT[9] (22)
Major diam. 0.8750–0.8668
PD 0.8384–0.8343
Minor diam. 0.8068 max.
LE 0.69

[9]Where the thread designation is used in text or is shown on a drawing and a leader line does not indicate the specific position, then add EXT or INT to the designation.

Copyright by the American Society Of Mechanical Engineers

6.6 Method of Designating Threads Having Special Length of Engagement

In the assembly of threads in mating parts, the length of engagement varies according to the design requirements. It should be noted that the length of engagement is not necessarily the same as the full thread length provided on the part, but is the length of assembled thread in the mating parts.

Where a standard series thread has a special length of engagement differing from that for which the standard pitch diameter tolerances are applicable as indicated in Section 5, the thread class symbol is qualified by the addition of the letters SE (special engagement) preceding the class symbol. The specification of the special pitch diameter limits of size and the length of engagement *LE*, rounded to a two place decimal, are a requirement.

EXAMPLES:
1/2-13 UNC-SE2A (23)
PD 0.4485–0.4423
LE 1.00

1/4-24 UNS-SE3A (23)
Major diam. 0.2500–0.2428
PD 0.2229–0.2194
LE 0.88

6.6.1 In some cases where greater than standard length of engagement is required, it is desirable to use standard externally threaded parts with tolerances based on standard length of engagement. For example, in the case of a standard bolt assembled into a tapped hole in aluminum, the designation of the bolt thread will conform to that of a thread for a standard length of engagement.

The designation for the tapped hole thread should include the allowance in the basic size, the pitch diameter limits of size, and the length of gage, in addition to the information normally given. See para. 5.3.1(e).

EXAMPLE: Requiring use of 1.00 long GO thread and GO plain gages
0.5025-13 UNS-SE2B (21)
Minor diam. 0.420–0.437
PD 0.4525–0.4606
LG 1.00

Similarly, where greater than standard length of engagement is required, it is desirable to use standard internally threaded parts with tolerances based on standard length of engagement. Therefore, the external thread is provided with an added allowance. See para. 5.3.1(f).

The designation for the external thread should include the added allowance in the basic size, the pitch diameter limits of size, and the length of gage, in addition to the information normally given.

EXAMPLE: Requiring use of 0.88 long GO thread and GO plain gages
0.3725-24 UNS-SE2A (21)
Major diam. 0.3714–0.3642
PD 0.3443–0.3396
LG 0.88

6.6.2 When a long length of engagement is required and standard length GO thread and GO plain gages are to be used, the thread designation should indicate the thread modifications and a standard gage length, *LG* Std. (see para. 5.3.2).

EXAMPLES: With additional allowance indicating use of standard length GO thread and GO plain gages
0.5058-13 UNS-2B (22)
Minor diam. 0.423–0.440
PD 0.4558–0.4623
LG Std.

0.3706-24 UNS-2A (22)
Major diam. 0.3695–0.3623
PD 0.3424–0.3386
LG Std.

6.6.3 For applications of long length of engagement of mating parts involving very high strength materials, increases in tolerances based on standard length of engagement may be detrimental. In these cases, the tolerances based on the standard length of engagement may be applied to increased length of engagement threads. This requires the GO thread gages to have a special length equal to the length of engagement as specified.

The designations for restricted applications should be qualified with the abbreviation SPL (special) as shown in the examples below. See para. 5.3.1(d).

EXAMPLES: Requiring use of 1.00 long GO thread and GO plain gages
0.500-20 UNF-3A SPL (21)
LG 1.00 SPL

0.500-20 UNF-3B SPL (21)
LG 1.00 SPL

NOTE: In drawings, tolerances tabulated for the standard length of engagement in ASME B1.1 shall apply over the full length of engagement.

6.7 Method of Designating Threads Having Modified Crests

It is occasionally necessary to modify the limits of size of the major diameter of an external thread or the minor diameter of an internal thread within the maximum-material limits established for standard series and special threads in order to fit a specific pur-

ASME B1.1 89 ■ 0759670 0039717 5 ■

pose, but without change in class of thread or pitch diameter limits. (It should be noted that standard pitch diameter gages may be used to accept such threads.) Such threads shall be specified with the established thread designation, followed by a statement of the modified diameter limits and the designation MOD. This practice also applies to modifications of internal thread minor diameters described in para. 5.6.1.

EXAMPLES:
$^3/_8$-24 UNF-3A MOD (21)
Major diam. 0.3720–0.3648 MOD

$1^1/_2$-10 UNS-3B MOD (21)
Minor diam. 1.398–1.409 MOD
PD 1.4350–1.4412
Major diam. 1.500 min.

7 DIMENSIONAL ACCOMMODATION OF COATING OR PLATING FOR 60 DEG. THREADS

7.1 Introduction

It is not within the scope of this Standard to make recommendations for thickness of, or to specify limits for, coatings. However, it will aid mechanical interchangeability if certain principles are followed wherever conditions permit. The following guides should be helpful in determining the amount and direction of the alterations to establish applicable limits of size before coating. Some commonly used and firmly established processes for heavy coatings, such as hot dip galvanizing, do not fall within the scope of this Section.

NOTE: The term *coating* refers to one or more applications of additive material to threads, including dry film lubricants, but excluding soft or liquid lubricants that are readily displaced in assembly and gaging. Plating is therefore included as coating in the text.

This Standard specifies limits of size that pertain whether threads are coated or uncoated. Only in Class 2A threads is the allowance available to accommodate coatings. Thus, in all classes of internal threads and in all Class 1A, 2AG, and 3A external threads, limits of size must be adjusted before plating to provide suitable provision for the desired coating.

7.2 Material Limits for Coated Threads

Unless otherwise specified, size limits for standard external thread Class 2A apply prior to coating. The external thread allowance may thus be used to accommodate the coating thickness on coated parts, provided that the maximum coating thickness is no more than one-fourth of the allowance (see Fig. 5). Thus, the thread after coating is subject to acceptance using a basic Class 3A size GO thread gage and a Class 2A thread gage for either minimum material or NOT GO. Where external thread has no allowance, or allowance must be maintained after coating, and for standard internal threads, sufficient allowance must be provided prior to coating to assure that finished product threads do not exceed the maximum-material limits specified. For thread Class 3A, Class 2A allowances in accordance with Tables 20 to 30 or Table 32 should be applied whenever possible (see paras. 7.4, 7.5, and 7.6).

7.3 Dimensional Effects of Coating

On a cylindrical surface, the effect of coating is to change the diameter by twice the coating thickness, one coating thickness on each side of the cylinder. Because the coating thickness is measured perpendicular to the coated surface, while the pitch diameter is measured perpendicular to the thread axis, the effect of a uniformly coated thread flank on the pitch diameter is a change of four times the thickness of coating on the flank (see Fig. 5). The diameters of external threads before coating will be smaller, while the diameters of internal threads before coating will be larger, than the coated diameters.

7.4 External Thread With Allowance Available for Coating

7.4.1 Maximum and Minimum Coating Thickness Specified. The amount of the allowance on the pitch diameter is sufficient for uniform coating if four times the maximum coating thickness is equal to or less than the allowance tabulated in Tables 3A, 3B, 20 to 30, or 32.

7.4.2 Only Nominal or Minimum Coating Thickness Specified. If no coating thickness tolerance is given, it is recommended that a tolerance of plus 50% of the nominal or minimum thickness be assumed. Then the amount of the allowance on the pitch diameter is sufficient for uniform coating if six times the specified coating thickness is equal to or less than the allowance tabulated in Tables 3A, 3B, 20 to 30, or 32.

7.5 External Thread With No Allowance for Coating

7.5.1 Maximum and Minimum Coating Thickness Specified. To determine before coating gaging limits for a uniformly coated thread, decrease:

(a) the maximum pitch diameter by four times the maximum coating thickness;

(b) the minimum pitch diameter by four times the minimum coating thickness;

(c) the maximum major diameter by two times the maximum coating thickness;

(d) the minimum major diameter by two times the minimum coating thickness.

EXAMPLE:
⅜-16 UNC-2A (21) AFTER COATING
Coating thickness 0.0002–0.0003 in.

To determine the before coating maximum-material sizes, decrease the maximum pitch diameter of 0.3331 in. by 0.0012 in. (4 × 0.0003) to 0.3319 in., and the maximum major diameter of 0.3737 in. by 0.0006 in. (2 × 0.0003) to 0.3731 in. For the before coating minimum sizes, decrease the minimum pitch diameter of 0.3287 in. by 0.0008 in. (4 × 0.0002) to 0.3279 in., and the minimum major diameter of 0.3643 in. by 0.0004 in. (2 × 0.0002) to 0.3639 in. The before coating sizes should be included in the thread designation (see para. 6.2.1).

7.5.2 Only Nominal or Minimum Coating Thickness Specified. If no coating thickness tolerance is given, it is recommended that a tolerance of plus 50% of the nominal or minimum thickness be assumed. Then, to determine before coating gaging limits for a uniformly coated thread, decrease:

(a) the maximum pitch diameter by six times the coating thickness;

(b) the minimum pitch diameter by four times the coating thickness;

(c) the maximum major diameter by three times the coating thickness;

(d) the minimum major diameter by two times the coating thickness.

EXAMPLE:
½-13 UNC-3A (22)
Coating thickness 0.0004 in.

Since the allowance for Class 2A thread is 0.0015 in., the nominal or minimum coating thickness that may be applied is equal to 0.0015 in. divided by six, or 0.00025 in. (the maximum thickness of coating that may be applied is equal to 0.0015 divided by four or 0.00038 in.). This is not sufficient for the required nominal or minimum coating of 0.0004 in. specified, so additional adjustments to the before coating pitch and major diameters must be made.

To determine the before coating maximum-material sizes, decrease the maximum pitch diameter of 0.4500 in. by 0.0024 in. (6 × 0.0004) to 0.4476 in., and the maximum major diameter of 0.5000 in. by 0.0012 in. (3 × 0.0004) to 0.4988 in. For the before coating minimum sizes, decrease the minimum pitch diameter of 0.4463 in. by 0.0016 in. (4 × 0.0004) to 0.4447 in., and the minimum major diameter of 0.4891 in. by 0.0008 in. (2 × 0.0004) to 0.4883 in. The before coating sizes should be included in the thread designation (see para. 6.2.1).

7.5.3 Adjusted Size Limits. It should be noted in the preceding examples that the before coating material limit tolerances are less than the tolerances after coating. This is because the coating tolerance consumes some of the product tolerance. In some instances, there may be insufficient pitch diameter tolerance available in the before coating condition, so that additional adjustments and controls will be necessary.

7.5.4 Strength. On small thread sizes (0.190 in. and smaller), there is a possibility that coating thickness adjustments will cause base material (minimum) conditions that may significantly affect the strength of externally threaded parts. Limitations on coating thickness, or part redesign, may be necessary.

7.6 Internal Threads

Standard internal threads provide no allowance for coating thickness. To determine before coating gaging limits for a uniformly coated thread, increase:

(a) the minimum pitch diameter by four times the maximum coating thickness, if specified, or by six times the minimum or nominal coating thickness, if not specified;

(b) the maximum pitch diameter by four times the minimum or nominal coating thickness;

(c) the minimum minor diameter by two times the maximum coating thickness, if specified, or by three times the minimum or nominal coating thickness, if not specified;

(d) the maximum minor diameter by two times the minimum or nominal coating thickness.

7.7 Other Considerations

It is essential to adequately review all possibilities and consider limitations in the threading and coating production processes before finalizing the coating

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:42:15 2005

process and the allowance required to accommodate the coating. A no allowance thread after coating shall not transgress the basic profile, and is therefore subject to acceptance using a basic Class 3A, 1B, 2B, or 3B size GO thread gage.

8 STANDARD SERIES THREADS (UN/UNR) AND LIMITS OF SIZE FOR STANDARD SERIES AND UNS/UNRS SERIES THREADS

8.1 Standard Series

The standard series for unified inch screw threads is listed in Table 2. Although the designations shown are for the UN thread form, UNR designations may be used in all cases.

8.2 Limits of Size

The limits of size are defined by the design profile at its maximum-material condition and the minimum profile at the minimum-material condition. The limits are specified as diameters (major diameter, minor diameter, pitch diameter), and the practical interpretation of these limits on a three-dimensional threaded product depends on the method of inspection. These dimensions serve as a basis for measurement and gaging of the thread, but the methods, techniques, and equipment used for thread evaluation establish the degree of thread conformance to the tabulated dimensions. Current techniques for measuring and gaging do not verify exact conformance of a thread to its specified maximum and minimum envelope. See ANSI/ASME B1.3M for gaging systems for dimensional acceptability.

8.2.1 Limits of size for the majority of the standard series are shown in Table 3A. Omissions are the secondary size range in the 4-UN series, all sizes over 6 in. in the 6-UN series, and all sizes over 6 in. in the 8-UN series. Refer to Table 2 for a list of secondary sizes.

8.2.2 The limits of size for selected combinations of diameter and pitch with tolerances and allowances to unified formulation (designated UNS) are shown in Table 3B.

8.2.3 Limits of size not given may be calculated from the formulas given in the following paragraphs. Formulas and symbols for thread form are given in Section 10.

8.3 Formulas for Limits of Size

These formulas were used to calculate the values shown in Tables 3A and 3B for standard series and selected combinations, respectively. The following symbols are used in the equations.

D bsc = basic major (nominal) diameter
h_s = height of external thread (see Table 6)
h_n = height of internal thread (see Table 6)
h_{as} = screw addendum height (see Table 6)
h_b = $2h_{as}$ (see Table 6)
D_2 bsc = basic pitch diameter ($D - h_b$) (see Tables 8 through 18)
d_3 = UNR series design minor diameter [$d_1 - (H/8)$] (see Tables 8 through 18)
D_1 bsc = basic minor diameter ($D - 2h_n$) (see Tables 8 through 18)
P = pitch, in.

To obtain limits of size using the formulas, see Table 6 for basic thread form data, Section 11 for basic dimensions, Sections 12 and 13 for allowances and tolerances, or Section 5 for formulas of allowance and tolerance. For easy reference, outline guides for determining limits of size of external and internal threads are given in Tables 1A and 1B.

Section 8 continues on page 53.

GENERAL NOTES:

(a) Series designation shown indicates the UN thread form; however, the UNR thread form may be specified by substituting UNR in place of UN in all designations for external use only.

(b) The minimum material pitch diameters in a number of cases do not agree with the pitch diameter increment total as given in Table 19. Tabulated pitch diameters shown have been in effect since ANSI B1.1-1949 edition. ASME B1 Committee agrees that no changes should be made.

NOTES:

(1) Thread classes may be combined. See para. 4.2.

(2) For Class 2A threads having an additive finish, the maximum major and pitch diameters, after coating, may equal the basic sizes, whose values are the same as the maximum values shown for Class 3A in these columns. See paras. 4.1.1 and 4.1.3.

(3) For unfinished hot material, not including standard fasteners with rolled threads.

(4) UN series external thread maximum minor diameter is basic (D_1 in Section 11) for Class 3A and basic minus allowance for Classes 1A and 2A.

(5) Formerly NF. Not a recommended standard size. Tolerances and allowances are based on one diameter length of engagement.

6-10 or 6.000-10	UNS	2A	0.0022	5.9978	5.9849	5.9328	5.9254	0.0074	5.8788	2B	5.892	5.913	5.9350	5.9446	0.0096	6.0000
6-14 or 6.000-14	UNS	2A	0.0020	5.9980	5.9877	5.9516	5.9451	0.0065	5.9130	2B	5.923	5.938	5.9536	5.9621	0.0085	6.0000

GENERAL NOTE:
Series designation shown indicates the UN thread form; however, the UNR thread form may be specified by substituting UNR in place of UN in all designations for external use only.

NOTES:
(1) Thread classes may be combined. See para. 4.2.
(2) For Class 2A threads having an additive finish, the maximum major and pitch diameters, after coating, may equal the basic sizes, whose values are the same as the maximum values shown for Class 3A in these columns. See paras. 4.1.1 and 4.1.3.
(3) UN series external thread maximum minor diameter is basic (D_1 in Section 11) for Class 3A and basic minus allowance for Classes 1A and 2A.

8.3.1 External Thread

(a) Maximum Major Diameter (External Threads)

(1) For Classes 1A and 2A, d = basic major diameter D bsc, minus allowance.

(2) For Class 3A, d = basic major diameter D bsc.

(b) Minimum Major Diameter (External Threads). For all classes, equals maximum major diameter, minus major diameter tolerance for respective class of thread.

(c) Maximum Pitch Diameter (External Threads)

(1) For Classes 1A and 2A, d_2 = basic pitch diameter D_2 bsc, minus allowance.

(2) For Class 3A, d_2 = basic pitch diameter D_2 bsc.

(d) Minimum Pitch Diameter (External Threads). For all classes, equals maximum pitch diameter, minus pitch diameter tolerance for respective class of thread.

(e) Maximum Minor Diameter (External Threads). In dimensioning UN series external threads, the minor diameter is not specified. In practice, the minor diameter is satisfactory when accepted by a standard GO thread gage in accordance with ANSI/ASME B1.2. When it is desirable to obtain minor diameter values for reference purposes and for UNR threads, they can be calculated as follows.

(1) For UN series threads, the formulas are:

(a) for Classes 1A and 2A, d_1 = basic minor diameter D_1 bsc, minus allowance;

(b) for Class 3A, d_1 = basic minor diameter D_1 bsc.

(2) For UNR series threads, the formulas are:

(a) for Classes 1A and 2A, d_3 = basic minor diameter D_1 bsc, minus allowance, minus $H/8$;

(b) for Class 3A, d_3 = basic minor diameter D_1 bsc, minus $H/8$.

(f) Minimum Minor Diameter (External Threads). When it is desirable for design purposes to calculate the minimum diameter, it can be obtained for all classes by the formula: minimum pitch diameter minus $0.649519P$.

8.3.2 Internal Thread

(a) Maximum Major Diameter (Internal Threads). In dimensioning internal threads, the maximum major diameter is not specified, being established by the crest of an unworn tool. In practice, the major diameter of an internal thread is satisfactory when accepted by a gage or gaging method that represents the maximum-material condition of an external thread that has no allowance.

(b) Minimum Major Diameter (Internal Threads) (D bsc). For all classes, equals basic diameter D bsc.

(c) Minimum Pitch Diameter. For all classes, D_2 bsc equals basic pitch diameter D_2 bsc.

(d) Maximum Pitch Diameter (Internal Threads). For all classes, equals minimum pitch diameter D_2 bsc, plus pitch diameter tolerance for respective class of thread.

(e) Minimum Minor Diameter (Internal Threads). For all classes, D_1 bsc equals minimum pitch diameter D_2 bsc, minus $H/2$, then rounded off to the nearest 0.001 in. for sizes 0.138 in. and larger. For Class 3B, a cipher is added to yield four decimal places.

(f) Maximum Minor Diameter (Internal Threads). For all classes, D_1 bsc equals minimum minor diameter before rounding off, plus minor diameter tolerance, then rounded off, for Classes 1B and 2B, to the nearest 0.001 in. for sizes 0.138 in. and larger. Class 3B values are not thus rounded off.

9 LEAD AND ANGLE TOLERANCES

9.1 Lead and Flank Angle Acceptance

Acceptance of lead and flank angles of product screw threads shall be in accordance with the following. Also, these are factors contributing to visual identification of gross defects in thread profile.

9.1.1 When Thread Gaging System 21 of ANSI/ASME B1.3M is specified, product thread lead (including helix) and flank angle variations are not considered as separate elements.

9.1.2 When Thread Gaging System 22 of ANSI/ASME B1.3M is specified, with the pitch diameter or thread-groove diameter inspection required, the product thread lead (including helix) and flank angles shall be considered acceptable when the minimum-material characteristic (pitch diameter or thread-groove diameter in Tables 1 and 2, columns C and D of ANSI/ASME B1.3M) and the maximum-material characteristic (GO in Tables 1 and 2, column A of ANSI/ASME B1.3M) are accepted by the gages specified for System 22, over the standard GO thread gage length.

When Thread Gaging System 22 is specified with NOT GO functional diameter combined with control of lead and flank option, agreements must be reached between the purchaser and the supplier on lead and flank angle limits and method of evaluation.

9.1.3 When Thread Gaging System 23 of ANSI/ASME B1.3M is specified, product thread lead and flank angles shall be acceptable if within the allowable variations specified in Tables 4 and 5, respectively. Also, the minimum-material characteristic (pitch diameter or thread-groove diameter in Tables 1 and 2, columns C and D of ANSI/ASME B1.3M) and the maximum-material characteristic (GO in Tables 1 and 2, column A of ANSI/ASME B1.3M) must be accepted by the gages specified for System 23, over the standard GO thread gage length.

Allowable variations in lead and flank angles are maximum values. Maximum variation in these and pitch diameter tolerance cannot be taken simultaneously (see paras. 9.1.5 and 9.1.6 below).

9.1.4 When individual inspections of lead (including helix) and flank angle variations are required in addition to thread gaging System 21 or 22 of ANSI/ASME B1.3M, the allowable variations for these characteristics shall be as specified in Tables 4 and 5.

9.1.5 For sizes not included in Tables 4 and 5, the allowable lead variation is equal to 0.57735 times one-half the pitch diameter tolerance. This is the lead variation that causes a change in functional diameter equal to one-half the pitch diameter tolerance. The allowable flank half-angle variation in minutes of arc is equal to 30 plus 1.875 times the number of threads per inch, rounded to the nearest 5 min.

9.1.6 For the requirements of paras. 9.1.4 and 9.1.5, lead variation values tabulated or calculated are the maximum variations from specified lead between any two points not farther apart than the length of the standard GO thread gage. Flank angle variation values are maximum variations from the basic 30 deg. angle between thread flanks and perpendiculars to the thread axis.

10 FORMULAS AND SYMBOLS FOR THREAD FORM

10.1 Thread Form Formulas and Symbols

Formulas are given below; data are tabulated in Table 6.

The general symbols used are defined in Table 7 and application of the symbols is shown in Fig. 6. Angle of thread

$$2\alpha = 60 \text{ deg.}$$

Half angle of thread

$$\alpha = 30 \text{ deg.}$$

Number of threads/in. is $1/P$. Pitch of thread

$$P = 1/(\text{no. of threads/in.})$$

Height of sharp V-thread (fundamental triangle)

$$H = 0.866025P$$

Height of UNR external thread, design form

$$h_s = 0.59539P$$

$$= {}^{11}/_{16}H$$

Height of internal thread and UN external thread

$$h_s = h_n = 0.54127P$$

$$= {}^{5}/_{8}H$$

Height of thread engagement

$$h_s = 0.54127P$$

$$= {}^{5}/_{8}H$$

Flat at crest of external thread

$$F_{cs} = 0.125P = P/8$$

Truncation of external thread crest

$$f_{cs} = 0.10825P$$

$$= H/8$$

Truncation of UNR external thread (for calculating minor diameter values in tables)

$$S_{rs} = 0.16238P$$

$$= {}^{3}/_{16}H$$

Basic flat at crest of internal thread and root of external thread

$$F_{cn} = 0.25P = P/4$$

Truncation of internal thread crest

$$f_{cn} = 0.21651P$$

$$= H/4$$

Flat at root of internal thread

$$F_{rn} = 0.125P = P/8$$

Truncation of internal thread root

$$f_{rn} = 0.10825P$$

$$= H/8$$

Addendum of external thread

$$h_{as} = 0.32476P$$

$$= {}^{3}/_{8}H$$

Major diameter of external thread is d. Pitch diameter of external thread

$$d_2 = d - 2h_{as}$$

$$= d - 0.64952P$$

Minor diameter of UNR external thread

$$d_3 = d - 2h_s$$

$$= d - 1.19078P$$

Minor diameter of UN external thread

$$d_1 = d - 2h_s$$

$$= d - 1.08253P$$

NOTES:
(1) The values tabulated in column 6 also pertain to the minimum root radius of UNR screw threads. See paras. 2.3.1 and 2.3.1(a).
(2) $h_{an} = f_{cn} = 0.25H$.
(3) $h_{dn} = h_{as} = 0.375H$.

TABLE 7 GENERAL SYMBOLS
(See Fig. 6)

Symbol	Dimension	Remarks	Symbol	Dimension	Remarks
d	Major diameter, external thread			Distance from apex of fundamental triangle to:	
D, D_3	Major diameter, internal thread		f_{cs}	flat at crest of external thread	
d_2	Pitch diameter, external thread		f_{rs}	flat at root of external thread	
D_2	Pitch diameter, internal thread		f_{cn}	flat at crest of internal thread	
d_1, d_3	Minor diameter, external thread		f_{rn}	flat at root of internal thread	
D_1	Minor diameter, internal thread			Width of:	
P	Pitch		F	flat (general)	
$1/P$	Number of threads per unit of length (per inch)		F_{cs}	flat at crest of external thread	
$1/L$	Number of turns per unit of length (per inch)		F_{rs}	flat at root of external thread	
H	Height of fundamental triangle		F_{cn}	flat at crest of internal thread	
h	Thread height (or depth)		F_{rm}	flat at root of internal thread	
h_a	Addendum		es	Allowance at major, pitch, and minor diameters of external thread	
h_d	Dedendum				
h_e	Depth of thread engagement				
α	Half angle of symmetrical thread		L_{ts}	Length of complete external thread	
α_1	Angle between leading flank of thread and normal to axis of thread		L_{tm}	Length of complete internal thread, including chamfer	
α_2	Angle between following flank of thread and normal to axis of thread		LE	Length of thread engagement	
λ	Lead angle	$\tan \lambda = \frac{L}{\pi(d_2 \text{ or } D_2)}$	w	Diameter of measuring wires	
	Radius of rounding at:		M_w	Measurement over wires	
r	crest of external thread		C	Correction to measurement over wires to give pitch diameter	d_2 or $D_2 = M_w - C - c$ $C = w(1 + \text{cosec } \alpha) - (\cot \alpha)/2n$
r_{rs}	root of external thread				
r_{cn}	crest of internal thread				
r_{rm}	root of internal thread				
	Radial distance from apex of fundamental triangle to:		λ'	Wire angle	
s_{cs}	rounded crest of external thread		c	Wire angle correction	See ANSI/ASME B1.2
s_{rs}	rounded root of external thread		Prefix symbol with Δ	Variation in any dimension	Examples: Variation in pitch, ΔP; variation in half angle, $\Delta\alpha_1$ or $\Delta\alpha_2$
s_{cn}	rounded crest of internal thread		$\Delta d_2\alpha$, $\Delta D_2\alpha$	Pitch diameter equivalent of variation in flank angles	
s_{rn}	rounded root of internal thread		$\Delta d_2\lambda$, $\Delta D_2\lambda$	Pitch diameter equivalent of variation in pitch (lead)	

GENERAL NOTE: Refer to ANSI/ASME B1.7M for latest symbol identification. Greek alphabet is below.

A α Alpha	Δ δ Delta	H η Eta	K κ Kappa	N ν Nu	Π π Pi	T τ Tau	X χ Chi
B β Beta	E ϵ Epsilon	Θ θ Theta	Λ λ Lambda	Ξ ξ Xi	P ρ Rho	Υ υ Upsilon	Ψ ψ Psi
Γ γ Gamma	Z ζ Zeta	I ι Iota	M μ Mu	O o Omicron	Σ σ Sigma	Φ ϕ Phi	Ω ω Omega

Major diameter of internal thread is D. Pitch diameter of internal thread is D_2. Minor diameter of internal thread

$$D_1 = D - 2h_n$$

$$= D - 1.08253P$$

11 TABLES OF BASIC DIMENSIONS

11.1 Table Content

The basic dimensions tabulated in Tables 8 through 18 include major diameter, pitch diameter, minor diameter of external threads, minor diameter of internal threads, lead angle, cross-sectional area at the minor diameter, and the tensile stress area.

11.2 Thread Series

Basic dimensions are given for each of the standard series threads.

12 TABLES OF ALLOWANCE AND TOLERANCE FOR STANDARD SERIES THREADS (UN/UNR)

12.1 Table Content

Tables 19 through 30 provide the allowance for Classes 1A and 2A (external threads); major diameter tolerance for Classes 1A, 2A, and 3A (external threads); pitch diameter tolerance for Classes 1B, 2B, and 3B (internal threads); and minor diameter tolerance for Classes 1B, 2B, and 3B (internal threads).

12.2 Relationship to Limits of Size

The allowance and tolerance values given in this Section can be combined with the basic dimensions given in Section 11 to calculate limits of size as explained in Section 8.

Final figures may have 0.0001 difference between the limited values calculated in this manner and the standard values in Table 3A, due to the use of rounded four decimal place numbers.

13 TABLES OF ALLOWANCE AND TOLERANCE FOR THREADS OF SPECIAL DIAMETERS, PITCHES, AND LENGTHS OF ENGAGEMENT (UNS/UNRS)

13.1 Table Content

Tables 31 through 40 provide the allowance for Classes 1A and 2A (external threads); major diameter tolerance for Classes 1A, 2A, and 3A (external threads); pitch diameter tolerance for Classes 1B, 2B, and 3B (internal threads); and minor diameter tolerance for Classes 1B, 2B, and 3B (internal threads).

13.2 Relationship to Limits of Size

The allowance and tolerance values given in this Section can be combined with the basic dimensions given in Section 11 to calculate limits of size as explained in Section 8.

GENERAL NOTE:
Class 2A tolerances are the bases for the tolerances for Classes 1A, 3A, 1B, 2B, and 3B.

NOTE:
(1) For example: *LE* = 0.5000 is equivalent to one diameter for the ½ in. size, 9 pitches for 18 threads per inch, or 20 pitches for 40 threads per inch.

TABLE 20 ALLOWANCES AND TOLERANCES FOR COARSE THREAD SERIES (UNC/UNRC)

Nominal Size	Basic Major Diameter *D*	Threads/in.	Allowances (1)	Tolerances

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Allowances apply to external thread Classes 1A and 2A only.
(2) Major diameter of internal threads may extend to a *P*/24 flat.
(3) Minor diameter of external threads may extend to a *P*/8 flat.
(4) Values are based on a length of engagement equal to the nominal diameter.
(5) For unfinished hot-rolled material threaded portion only, but does not include standard fasteners with rolled threads.

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Allowances apply to external thread Class 2A only and are taken from Table 32.
(2) Major diameter of internal threads may extend to a *P*/24 flat.
(3) Values for pitch diameter are based on a length of engagement of nine pitches, and those for Classes 2A and 2B are taken from the respective step tables.
(4) Minor diameter of external threads may extend to a *P*/8 flat.
(5) Values for minor diameter are based on a length of engagement of one diameter.

TABLE 24 (CONT'D)

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Asterisks denote standard sizes of the UNC thread series. See Note (4).
(2) Allowances apply to external thread Class 2A only and are taken from Table 32.
(3) Major diameter of internal threads may extend to a *P*/24 flat.
(4) Classes 2A, 2B, 3A, and 3B PD tolerances will be based on a length of engagement to be determined later by negotiation, except that for the 1⅜ in. and 1½ in. sizes they are based on a length of engagement equal to the nominal diameter.
(5) Minor diameter of external threads may extend to a *P*/8 flat.
(6) Class 2B minor diameter tolerances are based on a length of engagement of one diameter.

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Asterisk denotes standard size of the UNC series.
(2) Allowances apply to external thread Class 2A only.
(3) Major diameter of internal threads may extend to a *P*/24 flat. For major diameter tolerances for Classes 2A and 2B unfinished hot-rolled material, see Tables 3A and 3B.
(4) The values for 8-UN Classes 2A, 2B, 3A, and 3B are based on a length of engagement equal to the nominal diameter.
(5) Minor diameter of external threads may extend to a *P*/8 flat.
(6) Values for minor diameter are based on a length of engagement of one diameter.

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Asterisks denote standard sizes of the UNC or UNF series and tolerances are the same as for those series, being based on a length of engagement equal to the nominal diameter. See Note (4).
(2) Allowances apply to external thread Class 2A only and are taken from Table 32.
(3) Major diameter of internal threads may extend to a *P*/24 flat.
(4) Classes 2A, 2B, 3A, and 3B tolerances are based on a length of engagement of nine pitches and are taken from Tables 34, 35, 37, and 38, except as indicated by an asterisk.
(5) Minor diameter of external threads may extend to a *P*/8 flat.
(6) Classes 2B and 3B minor diameter tolerances are based on a length of engagement of one diameter.

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Asterisks denote standard sizes of the UNC or UN thread series. See Note (4).
(2) Allowances apply to external thread Class 2A only and are taken from Table 32.
(3) Major diameter of internal threads may extend to a *P*/24 flat.
(4) Classes 2A, 2B, 3A, and 3B PD tolerances are based on a length of engagement of nine pitches and are taken from Tables 34, 35, 37, and 38, except that for the ⅜ in. and ¾ in. sizes they are based on a length of engagement equal to the nominal diameter.
(5) Minor diameter of external threads may extend to a *P*/8 flat.
(6) Classes 2B and 3B minor diameter tolerances are based on a length of engagement of one diameter.

GENERAL NOTE:
See Section 5 for application of allowances and tolerances.

NOTES:
(1) Asterisks denote standard sizes of the UNC, UNF, or UNEF thread series. See Note (4).
(2) Allowances apply to external thread Class 2A only and are taken from Table 32.
(3) Major diameter of internal threads may extend to a *P*/24 flat.
(4) Classes 2A, 2B, 3A, and 3B PD tolerances are based on a length of engagement of nine pitches and are taken from Tables 34, 35, 37, and 38, except that for the Nos. 6, 8, and 10 sizes they are based on a length of engagement equal to the nominal diameter.
(5) Minor diameter of external threads may extend to a *P*/8 flat.
(6) Classes 2B and 3B minor diameter tolerances are based on a length of engagement of one diameter.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Class 1A tolerances in this Table for 5 to 15 pitches are based on 9 pitches and are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places (see Table 19) by a factor of 1.5.

(c) Class 1A tolerances in this Table for 16 to 30 pitches are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 1.875 (obtained by multiplying the 1.5 factor by 1.25). For lengths of engagement not tabulated, see Section 5.

(d) Pitches listed are those used most commonly and are recommended. Where intermediate pitches are specified, the formula in Section 5 should be applied.

(e) Tolerances are tabulated only for combinations of diameter, pitch, and length of engagement that are considered to be generally used. For other combinations encountered, see Section 5.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Formula:

Class 2A tolerances $= 0.0015\sqrt[3]{D} + 0.0015\sqrt{LE} + 0.015\sqrt[3]{P^2}$, where

D = basic major diameter

LE = length of engagement

P = pitch

(c) Length of engagement increments included in the tabulated tolerances for lengths of engagement of from 5 to 15 pitches are based on lengths of 9 pitches; those for lengths of engagement of from 16 to 30 pitches are obtained by multiplying the 9 pitch values taken to six decimal places by 1.25. For lengths of engagement not tabulated, the formula in (b) above should be applied except as modified.

(d) Pitches listed are those used most commonly and are recommended. When intermediate pitches are specified, the formula in (b) above should be applied.

(e) Tolerances are tabulated only for combinations of diameter, pitch, and length of engagement that are considered to be generally used. For other combinations encountered, see Section 5.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Class 3A tolerances in this Table for 5 to 15 pitches are based on 9 pitches and are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 0.75.

(c) Class 3A tolerances in this Table for 16 to 30 pitches are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 0.9375 (obtained by multiplying the 0.75 factor by 1.25). For lengths of engagement not tabulated, see Section 5.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Class 1B (internal thread) tolerances in this Table for 5 to 15 pitches are based on 9 pitches and are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 1.95.

(c) Class 1B tolerances in this Table for 16 to 30 pitches are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 2.437 (obtained by multiplying the 1.95 factor by 1.25). For lengths of engagement not tabulated, see Section 5.

(d) Pitches listed are those used most commonly and are recommended. Where intermediate pitches are specified, the formula in Section 5 should be applied.

(e) Tolerances are tabulated only for combinations of diameter, pitch, and length of engagement that are considered to be generally used. For other combinations encountered, see Section 5.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Class 2B (internal thread) tolerances in this Table for 5 to 15 pitches are based on 9 pitches and are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 1.3.

(c) Class 2B tolerances in this Table for 16 to 30 pitches are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 1.625 (obtained by multiplying the 1.3 factor by 1.25). For lengths of engagement not tabulated, see Section 5.

(d) Pitches listed are those used most commonly and are recommended. Where intermediate pitches are specified, the formula in Section 5 should be applied.

(e) Tolerances are tabulated only for combinations of diameter, pitch, and length of engagement that are considered to be generally used. For other combinations encountered, see Section 5.

GENERAL NOTES:

(a) These values do not agree with and shall not be used in place of any tabulated values for the UNC, UNF, and 8-UN thread series.

(b) Class 3B (internal thread) tolerances in this Table for 5 to 15 pitches are based on 9 pitches and are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 0.975.

(c) Class 3B tolerances in this Table for 16 to 30 pitches are obtained by multiplying the Class 2A (external thread) tolerances for 9 pitches taken to six decimal places by a factor of 1.21875 (obtained by multiplying the 0.975 factor by 1.25). For lengths of engagement not tabulated, see Section 5.

(d) Pitches listed are those used most commonly and are recommended. Where intermediate pitches are specified, the formula in Section 5 should be applied.

(e) Tolerances are tabulated only for combinations of diameter, pitch, and length of engagement that are considered to be generally used. For other combinations encountered, see Section 5.

NOTES TO TABLE 39

(1) Tolerances for lengths of engagement in terms of pitch should be selected from equivalent lengths of engagement in terms of diameter ranges.
(2) If the minor diameter tolerance as selected from this Table is less than the pitch diameter tolerance, use the latter.

NOTES:
(1) For 0.151 in. diameter sizes and smaller, tolerance values for all three classes are the same. For smaller sizes, tolerance values are given in Table 39.
(2) Tolerances for lengths of engagement in terms of pitch should be selected from equivalent lengths of engagement in terms of diameter ranges.
(3) If the minor diameter tolerance as selected from this Table is less than the pitch diameter tolerance, use the latter.

APPENDIX A
TERMINOLOGY AND IDENTIFICATION OF UNIFIED INCH SCREW THREADS

(This Appendix is not part of ASME B1.1-1989, and is included for information purposes only.)

A1 TERMINOLOGY

All terms relating to screw threads used in this Standard are defined in ANSI/ASME B1.7M.

A2 IDENTIFICATION

The various unified screw threads covered by B1 standards are compared in Fig. A1 and Table A1.

TABLE A1 IDENTIFICATION OF 60 DEG. INCH SCREW THREADS WITHIN THE SCOPE OF ASME COMMITTEE B1

Thread Identification	UN Threads, Internal and External	UNR Threads, External Only	UNJ Threads, Internal and External
ANSI standards documents	B1.1, Unified Inch Screw Threads; B1.2, Gages and Gaging for Unified Inch Screw Threads	B1.1, Unified Inch Screw Threads; B1.2, Gages and Gaging for Unified Inch Screw Threads	Draft of B1.15, Unified Inch Screw Threads — UNJ Thread Form; draft of B1.23, Gages and Gaging for Unified Inch Screw Threads — UNJ
External root	External thread root may be flat or rounded	Rounded root specified	Rounded root specified
External minor diameter	External thread minor diameter is not toleranced	External thread minor diameter is not toleranced	External thread minor diameter is toleranced
External threads	UN Classes 1A, 2A, and 3A	UNR Classes 1A, 2A, and 3A	UNJ Class 3A mates only with UNJ internal threads
Internal threads	UN Classes 1B, 2B, and 3B	No internal threads designated UNR; UNR mates with UN internal threads	UNJ Class 3B (no rounding required on internal thread root)

GENERAL NOTES:
(a) The above cannot be used as a working sheet. Refer to the appropriate standards, as listed, for complete thread details and conformance data.
(b) The appropriate current standard is the authoritative document for complete details and data and takes precedence over this sheet.
(c) These standards may be purchased from the ASME Order Department, 22 Law Drive, Box 2300, Fairfield, NJ 07007-2300; telephone (201) 882-1167.

APPENDIX B
THREAD STRENGTH DESIGN FORMULAS

(This Appendix is not part of ASME B1.1-1989, and is included for information purposes only.)

B1 THREAD TENSILE STRESS AREA

The following thread tensile stress area formulas are used for the purpose of product acceptance computations. Tensile stress area

$$A_s = 3.1416 \left[\frac{D_2}{2} - \frac{3H}{16}\right]^2$$

or

$$A_s = 0.7854 \left[D - \frac{0.9743}{1/P}\right]^2$$

where

D_2 = basic pitch diameter
D = basic major diameter
$1/P$ = number of threads per inch

For $3H/16$, see Table 6.

B2 THREAD SHEAR AREA

The following formulas for thread shear areas are geometric minimum values. Shear (thread stripping) strengths of screw threads under load are dependent, in addition, on mating component relative material strengths, nut geometry, and coefficient of friction between thread bearing surfaces. Effective shear areas are therefore somewhat less than the geometric values. Thread geometric shear areas

$$AS_n = 3.1416\ (1/P)\ (LE)\ (D \text{ min.}) \times \left[\frac{1}{2(1/P)} + 0.57735\ (D \text{ min.} - D_2 \text{ max.})\right]$$

$$AS_s = 3.1416\ (1/P)\ (LE)\ (D_1 \text{ max.}) \times \left[\frac{1}{2(1/P)} + 0.57735\ (d_2 \text{ min.} - D_1 \text{ max.})\right]$$

where

AS_n = minimum thread shear area for internal threads
AS_s = minimum thread shear area for external threads
$1/P$ = number of threads per inch
LE = length of engagement
D min. = minimum major diameter of external thread
D_2 max. = maximum pitch diameter of internal thread
D_1 max. = maximum minor diameter of internal thread
d_2 min. = minimum pitch diameter of external thread

B3 LENGTH OF THREAD ENGAGEMENT

In general, the length of engagement of mating threads is selected to utilize full tensile strength of a bolt prior to shearing of nut threads. Otner applications may require internal thread shear prior to failure of the externally threaded part. For noncritical design, the following formulas are often used for approximation:

$$\text{tensile strength of externally threaded part} = S_t A_s$$

$$\text{shear strength of threads} = 0.5 S_t\ (AS_n \text{ or } AS_s)$$

where

S_t = ultimate tensile strength of material, psi

An internationally accepted study on the subject was published in the 1977 Transactions of the Society of Automotive Engineers as paper number 770420, Analysis and Design of Threaded Assemblies, by E. M. Alexander.

APPENDIX C
UNIFIED INCH SCREW THREADS — METRIC TRANSLATION

(This Appendix is not part of ASME B1.1-1989, and is included for information purposes only.)

C1 BACKGROUND

This Appendix presents a translation of unified inch screw threads into metric units of measurement. It is very important to recognize that this translation is not ISO metric screw threads. The tables of limiting dimensions of standard and UNS/UNRS series threads and the table of thread form data translated from inches to millimeters presented in this Appendix implement the decision of the B1 Committee that there should be official metric translations of inch screw thread standards to better fill communication needs in international exchange of technical data. This philosophy originated at the May 4, 1964, meeting of the Committee and was approved by a letter ballot of the Committee on November 2, 1966.

The tables in this Appendix were originally published as USAS B1.1a—1968 Supplement to USAS B1.1—1960, in the interest of meeting urgent needs of industry.

C2 DIMENSIONS

All dimensions in this Appendix are given in millimeters unless otherwise specified. Metric values in the limiting dimension tables are translations of the inch values tabulated in ASME B1.1.

In all cases, the metric values have been rounded toward the interior of the tolerance zone, that is, maximum limits have been rounded downward and minimum limits have been rounded upward. This method of rounding the translated values was selected to permit the use of existing gages. To avoid penalizing the producer excessively, gages should be based on the inch values rather than the metric translations.

Where it is necessary to use metric values of threads for which the metric limiting dimensions are not tabulated herein, the inch values should be determined in accordance with Section 8 of ASME B1.1 before translating to metric values and rounding by the method prescribed in the foregoing paragraph.

C3 DESIGNATIONS

Designation of unified inch screw threads expressed in metric dimensions shall be as prescribed in paras. C3.1 and C3.2.

C3.1 Metric Drawings or Documents

On metric drawings or documents, the designation shall specify, in sequence, the nominal size (expressed in decimal inches), the number of threads per inch, thread series symbol, and thread class symbol. All supplemental dimensions shall be as shown in metric units. The equivalent inch dimensions, as indicated and enclosed in parentheses, may be included if desired.

EXAMPLE (on metric drawing or metric document):
0.250-28 UNF-2A (22)
PD 5.735–5.652
(0.2258–0.2225 in.) (optional)

C3.2 Inch Drawings or Documents

On inch drawings or documents, the designation and supplemental dimensions expressed in inches may be further supplemented by inclusion of the equivalent metric dimensions, so indicated and enclosed in parentheses.

EXAMPLE:
0.250-28 UNF-2A (22)
PD 0.2258–0.2225
(5.735–5.652 mm) (optional)

C4 TABLES

Tables C1, C2, and C3 give limits of size for standard series and UNS/UNRS series threads and thread form data.

GENERAL NOTE:
Series designation shown indicates the UN thread form; however, the UNR thread form may be specified by substituting UNR in place of UN in all designations for external use only.

NOTES:
(1) Thread classes may be combined. See para. 4.2 of ASME B1.1.
(2) For Class 2A threads having an additive finish, the maximum major and pitch diameters, after coating, may equal the basic sizes, whose values are the same as the maximum values shown for Class 3A in these columns. See paras. 4.1.1 and 4.1.3 of ASME B1.1.
(3) For unfinished hot material, not including standard fasteners with rolled threads.
(4) UN series external thread maximum minor diameter is basic (D_1 in Section 11) for Class 3A and basic minus allowance for Classes 1A and 2A.

TABLE C2 LIMITS OF SIZE FOR SELECTED COMBINATIONS OF UNS/UNRS SERIES THREADS, mm (CONT'D)

Nominal Size (in.) and Threads/in.	Series Designation	Metric Equivalents		External (1)								Internal (1)						
						Major Diameter		Pitch Diameter			UNR Minor Diam. Max. (3) (Ref.)		Minor Diameter		Pitch Diameter			Major Diameter
		Diameter	Pitch	Class	Allowance	Max. (2)	Min.	Max. (2)	Min.	Tolerance		Class	Min.	Max.	Min.	Max.	Tolerance	Min.
5¾-10 or 5.7500-10	UNS	146.050	2.540	2A	0.056	145.994	145.667	144.343	144.156	0.187	142.972	2B	143.307	143.840	144.399	144.642	0.243	146.050
5¾-14 or 5.7500-14	UNS	146.050	1.814	2A	0.052	145.999	145.738	144.820	144.656	0.164	143.840	2B	144.095	144.475	144.872	145.087	0.215	146.050
6-10 or 6.0000-10	UNS	152.400	2.540	2A	0.056	152.344	152.017	150.693	150.506	0.187	149.322	2B	149.657	150.190	150.749	150.992	0.243	152.400
6-14 or 6.0000-14	UNS	152.400	1.814	2A	0.052	152.349	152.088	151.170	151.006	0.164	150.190	2B	150.445	150.825	151.222	151.437	0.215	152.400

GENERAL NOTE:
Series designation shown indicates the UN thread form; however, the UNR thread form may be specified by substituting UNR in place of UN in all designations for external use only.

NOTES:
(1) Thread classes may be combined. See para. 4.2 of ASME B1.1.
(2) For Class 2A threads having an additive finish, the maximum major and pitch diameters, after coating, may equal the basic sizes, whose values are the same as the maximum values shown for Class 3A in these columns. See paras. 4.1.1 and 4.1.3.
(3) UN series external thread maximum minor diameter is basic (D_1 in Section 11) for Class 3A and basic minus allowance for Classes 1A and 2A.

ADOPTION NOTICE

ANSI-B1.20.1, "Pipe Threads, General Purpose (Inch)," was adopted on October 3, 1994 for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Commanding Officer, Naval Construction Battalion Center, Code 156, 1000 23rd Avenue, Port Hueneme, CA 93043-4301. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from the American National Standards Institute, 11 West 42nd Street, New York, NY 10036.

Date of Issuance: August 31, 1983

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

(This Foreword is not part of American National Standard, Pipe Threads, General Purpose (Inch) ANSI/ASME B1.20.1-1983.)

In 1973 American National Standards Committee B2, which had formerly been responsible for pipe thread standards, was absorbed by ANSI Standards Committee B1 and reorganized as subcommittee 20. A complete rewrite of the B2.2-1968 standard on Dryseal Pipe Threads has been completed, with the product thread data in separate documents from the gaging standards for Dryseal Pipe Threads. The system of numbering, to include metric conversions, is as follows:

ANSI B1.20.3-1976 Dryseal Pipe Threads (Inch)
ANSI B1.20.4-1976 Dryseal Pipe Threads (Metric Translation)
ANSI B1.20.5-1978 Gaging for Dryseal Pipe Threads (Inch)
In preparation, B1.20.6M Gaging for Dryseal Pipe Threads (Metric Translation)

A complete rewrite of the B2.1-1968 standard on Pipe Threads (Except Dryseal) was then undertaken. The system of numbering, to include metric conversions, is as follows:

ANSI/ASME B1.20.1 Pipe Threads, General Purpose (Inch)
In preparation, B1.20.2M Pipe Threads, General Purpose (Metric Translation)

These standards, ANSI/ASME B1.20.1 and B1.20.2M, have product thread dimensions and gaging in the same document. Thread inspection specifies the use of L_1 taper thread plug and ring gages similar to B2.1-1968. In addition, emphasis is given to the requirement that all basic thread design dimensions are to be met within the specified tolerances.

The data in this Standard supersede those given in ANSI B2.1-1968.

The ANSI/ASME B1.20.1 was approved by ASME Standards Committee B1 on December 1, 1982 for publication as an official ANSI standard.

The proposed standard was submitted by standards committee B1 to the Secretariat and the American National Standards Institute. It was approved and formally designated as an American National Standard on February 4, 1983.

AN AMERICAN NATIONAL STANDARD

PIPE THREADS, GENERAL PURPOSE (INCH)

1 INTRODUCTION

1.1 Scope

This American National Standard covers dimensions and gaging of pipe threads for general purpose applications.

1.2 Thread Designations

1.2.1 The types of pipe threads included in this Standard are designated by specifying in sequence the nominal pipe size,[1] number of threads per inch and the thread series symbol as follows:

3/8 - 18 NPT
1/8 - 27 NPSC
1/2 - 14 NPTR
1/8 - 27 NPSM
1/8 - 27 NPSL
1 - 11.5 NPSH

For left hand threads add LH to the designation, otherwise right hand threads will be understood. For example:

3/8 - 18 NPT - LH

1.2.2 Each of these letters in the symbols has a definite significance as follows:

N = National (American) Standard
P = Pipe
T = Taper
C = Coupling
S = Straight
M = Mechanical
L = Locknut
H = Hose Coupling
R = Railing Fittings

[1]Where it is necessary to use decimal notation for the size designation (as when inserting such in a computer or electronic accounting machine) the decimal equivalent of nominal pipe size may be substituted for fractional pipe sizes.

1.2.3 Coated or Plated Threads. The threaded product specifications covered in this Standard do not include an allowance for coatings or plating.

1.3 Sealing

1.3.1 Where pressure-tight joints are required, it is intended that taper pipe threads conforming to this Standard be made up wrench-tight with a sealant. To prevent galling on certain piping materials such as stainless steels, the sealant usually contains a lubricant.

1.3.2 Pipe threads designed for pressure-tight joints that may be used without sealing compounds (Dryseal Threads) are covered in ANSI B1.20.3 (Inch) and ANSI B1.20.4 (Metric Translation).

1.4 Inspection

A gaging method and tolerances are prescribed in this Standard to effect a functional inspection of the handtight L_1 engagement threads. However, conformance to this Standard requires that all basic design dimensions be met (within applicable tolerances) including extension of the thread elements to provide for wrench-tight makeup. Therefore, additional methods of gaging may be employed to evaluate conformance to the basic design dimensions. When additional methods of gaging are employed, they shall be agreed upon by the supplier and the purchaser.

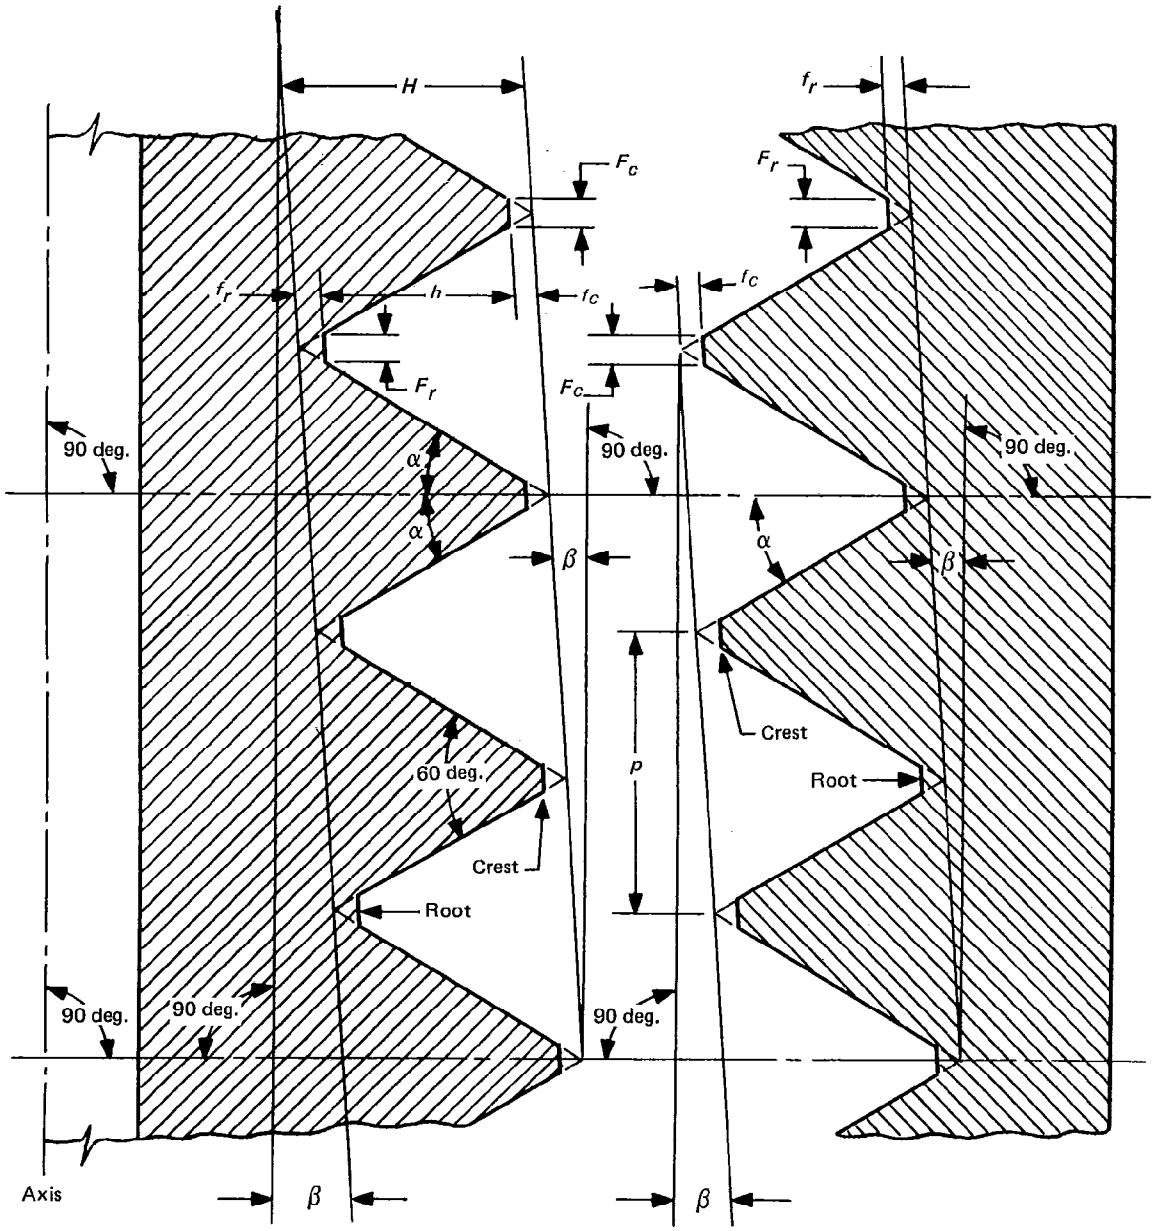
1.5 Appendix

Useful and supplementary information which is not a part of this Standard is presented in the Appendix. Specifically, the Appendix gives Suggested Twist Drill Diameters for Drilled Hole Sizes for Pipe Threads.

1.6 Related Standard

Definitions of terms and symbols for thread dimensions are given in ANSI B1.7, Nomenclature, Definitions and Letter Symbols for Screw Threads.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:43:27 2005



NOTATION

H	= 0.866025p = height of 60 deg. sharp V thread	β	= 1 deg. 47 min. = thread taper angle for 1/16 taper
h	= 0.800000p = height of thread on product	f_c	= depth of truncation at crest
p	= $1/n$ = pitch (measured parallel to axis)	f_r	= depth of truncation at root
n	= number of threads per inch	F_c	= width of flat at crest
α	= 30 deg. = thread flank angle	F_r	= width of flat at root

GENERAL NOTE: For a symmetrical straight screw thread, $H = \cot \alpha/2n$. For a symmetrical taper screw thread, $H = (\cot \alpha - \tan^2 \beta \tan \alpha)/2n$, so that the exact value for an American National Standard taper pipe thread is $H = 0.865743p$ as against $H = 0.866025p$, the value given above. For an 8-pitch thread, which is the coarsest standard taper pipe thread pitch, the corresponding values of H are 0.108218 and 0.108253 respectively, the difference being 0.000035 inch. This difference being too small to be significant, the value of $H = 0.866025p$ continues in use for threads of 0.750 in., or less, taper/ft on the diameter.

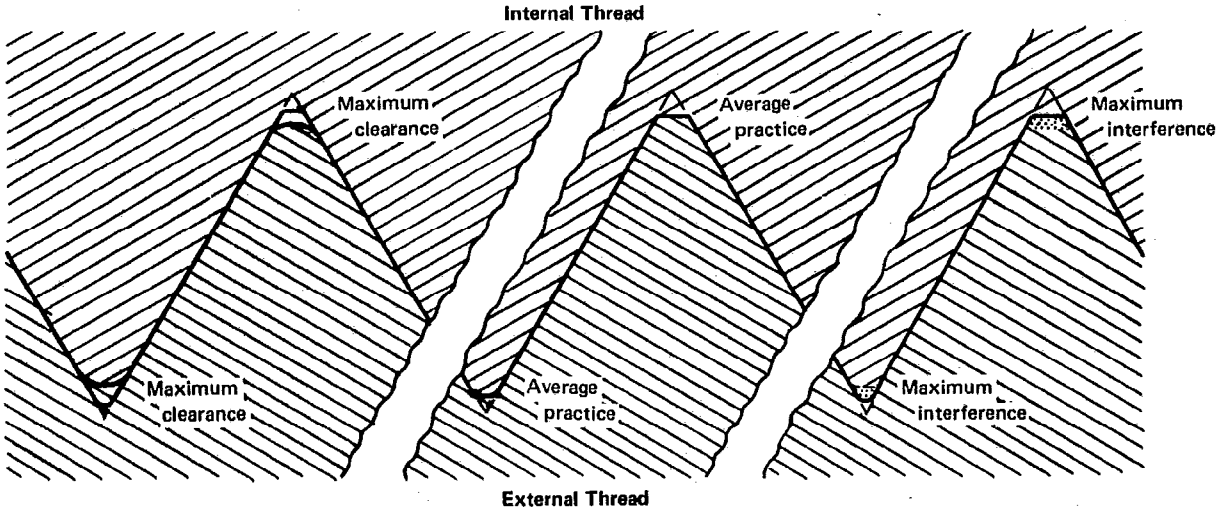
NOTE:

(1) The basic dimensions of the American National Standard Taper Pipe Thread are given in inches to four and five decimal places. While this implies a greater degree of precision than is ordinarily attained, these dimensions are so expressed for the purpose of eliminating errors in computations.



GENERAL NOTE:
When threaded joints are made up wrench-tight with lubricant or sealer, it is intended that the flanks shall be in contact.

FIG. 2. AMERICAN NATIONAL STANDARD TAPER PIPE THREADS FOR PRESSURE-TIGHT JOINTS, NPT

2 AMERICAN NATIONAL STANDARD PIPE THREAD FORM

2.1 Thread Form

The form of thread profile specified in this Standard shall be known as the American National Standard Pipe Thread Form. The relations as specified herein, for form of thread and general notation are shown in Fig. 1.

2.2 Angle of Thread

The angle between the sides of the thread is 60 deg when measured in an axial plane. The line bisecting this angle is perpendicular to the axis.

2.3 Truncation and Thread Height

The height of the sharp V thread, H, is

$$H = 0.866025p = 0.866025/n$$

where

p = pitch of thread
n = threads per inch

The basic maximum depth of the truncated thread, h (see Fig. 1), is based on factors entering into the manufacture of cutting tools and the making of tight joints.

$$h = 0.800p = 0.800/n$$

The crest and root of pipe threads are truncated a minimum of $0.033p$. The maximum depth of truncation for the crest and root of these pipe threads will be found in Table 1. The crests and roots of the external and internal threads may be truncated either parallel to the pitch line or parallel to the axis.

The sketch in Table 2, giving a sectional view of this Standard thread form, represents the truncated thread form by a straight line. However, when closely examined, the crests and roots of commercially manufactured pipe threads appear slightly rounded. When crests and roots of threading tools or chasers lie within the limits shown in Table 1, the pipe threads of products produced by such means are acceptable on the basis of in-process control.

3 SPECIFICATION FOR GENERAL PURPOSE TAPER PIPE THREADS, NPT

3.1 Taper Pipe Threads

Threads made in accordance with these specifications consist of an external taper and an internal taper thread, to form the normal type of joint having general application on pipe and fittings. See Fig. 2.

NPT taper pipe threads are intended to be made up wrench-tight and with a sealant whenever a pressure-tight joint is required.

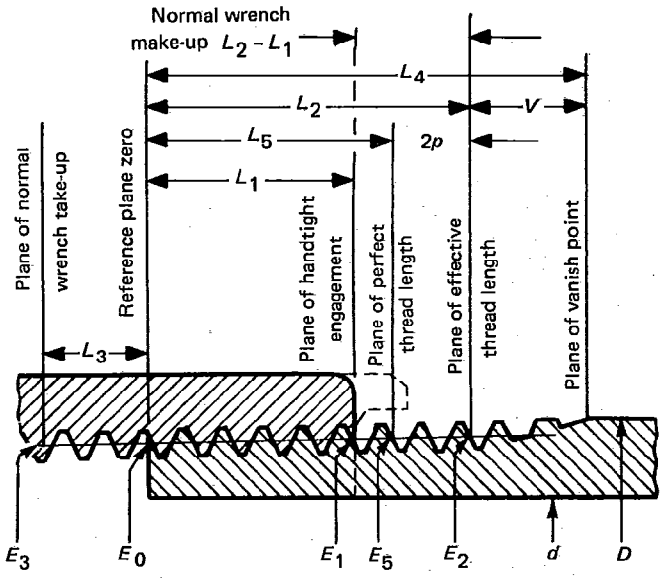

FIG. 3 AMERICAN NATIONAL STANDARD TAPER PIPE THREAD NOTATION

Sealing is affected by out-of-roundness which is possible between the wrench-tight mated parts in final assembly. This will vary depending on the method for producing the thread in conjunction with the elasticity and/or ductility of the mating parts and the resultant conformance at final assembly.

3.1.1 Thread Designation and Notation. American National Standard Taper Pipe Threads are designated in accordance with 1.2.1 as follows:

3/8 - 18 NPT

Standard notation applicable to American National Standard Taper Pipe Threads is shown in Fig. 3.

3.1.2 Designation of Plated Threads. The product specifications of this Standard do not include an allowance for plating. If plating is desired, it may be necessary to modify the threads since the same final gaging requirements must be satisfied for plated and unplated parts. This may be emphasized by adding the words AFTER PLATING to the designation. For manufacturing purposes, notes for plated taper pipe threads may specify the gage limits (turns or threads engagement) before plating followed by the words BEFORE PLATING. These should be followed by the standard gage limits (turns or threads engagement) after plating and the words AFTER PLATING.

3.1.3 Form of Thread. The form of the thread for American National Standard Taper Pipe Threads is that specified in 2.1.

3.1.4 Taper of Thread. The taper of the thread is 1 in 16 or 0.75 in./ft measured on the diameter and along the axis.

3.1.5 Diameter of Thread. The basic pitch diameters of the taper thread are determined by the following formulas[2] based on the outside diameter of the pipe and the pitch of the thread:

$$E_0 = D - (0.05D + 1.1)\,1/n$$
$$= D - (0.05D + 1.1)\,p$$
$$E_1 = E_0 + 0.0625L_1$$

where

D = outside diameter of pipe
E_0 = pitch diameter of thread at end of pipe or small end of external thread
E_1 = pitch diameter of thread at the gaging notch or large end of internal thread
L_1 = normal engagement by hand between external and internal threads
n = threads per inch

[2]For the 1/8-27 and 1/4-18 sizes, E_1 approx. $= D - (0.05D + 0.827)\,p$.

(5) The length L_5 from the end of the pipe determines the plane beyond which the thread form is incomplete at the crest. The next two threads are complete at the root. At this plane the cone formed by the crests of the thread intersects the cylinder forming the external surface of the pipe. $L_5 = L_2 - 2p$.

(6) Given as information for use in selecting tap drills. (See Appendix).

(7) Military Specification MIL—P—7105 gives the wrench makeup as three threads for sizes 3 and smaller. The E_3 dimensions are as follows: Nominal pipe size 2½ = 2.69609 and size 3 = 3.31719; sizes 2 and smaller same as above, col. 16.

(8) Reference dimension.

4	4.500	8	4.275	4.3754	4.3988

NOTE:
(1) Attention is called to the fact that the actual pitch diameter of the straight tapped hole will be slightly smaller than the value given when gaged with a taper plug gage as specified in 9.1.2.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:43:30 2005

3.1.6 Length of Thread. The basic length of the effective external taper thread L_2, is determined by the following formula based on the outside diameter of the pipe and the pitch of the thread:

$$L_2 = (0.80D + 6.8)\,1/n$$
$$= (0.80D + 6.8)\,p$$

where

D = outside diameter of pipe
n = threads per inch

This formula determines directly the length of effective thread which includes two usable threads slightly incomplete at the crest.

3.1.7 Engagement Between External and Internal Taper Threads. The normal length of engagement between external and internal taper threads when screwed together handtight is shown in col. 6, Table 2. This length is controlled by the construction and use of the gages. It is recognized that in special applications, such as flanges for high pressure work, longer thread engagement is used, in which case the pitch diameter (dimension E_1, Table 2) is maintained and the pitch diameter E_0 at the end of the pipe is proportionately smaller.

3.1.8 Basic Dimensions. The basic dimensions of taper pipe threads, derived from the above specifications, are given in Table 2. All dimensions are given in inches unless otherwise specified.

3.2 Tolerances

3.2.1 Manufacturing Tolerance on Product. The maximum allowable deviation in the commercial product is one turn large or small from gages made to the basic dimensions. See 8.2 and 8.3.

3.2.2 Tolerances on Thread Elements. The permissible deviations in thread elements are given in Table 3. This table is a guide for establishing limits of the thread elements of taps, dies, and thread chasers. Conformance to these limits may be required on product threads, in which case specifications shall require control and checking of thread elements.

On pipe fittings and valves (not steel or high grade alloys used in critical services) for steam pressures 300 lb and below, it is intended that plug and ring gage practices as established in this Standard be used in conjunction with tooling control of thread elements, e.g., taps and dies, to provide satisfactory control of functional size. Therefore, no tolerances on thread elements have been established for this class.

For service conditions, where more exact checks are required, procedures have been developed by industry to supplement the standard plug and ring gage method of gaging.

4 SPECIFICATIONS FOR INTERNAL STRAIGHT THREADS IN PIPE COUPLINGS, NPSC

4.1 Straight Pipe Threads in Pipe Couplings

Threads in pipe couplings made in accordance with these specifications are straight (parallel) threads of the same thread form as the American National Standard Taper Pipe Thread specified in 2.1. They are used to form pressure-tight joints when assembled with an American National Standard external taper pipe thread and made up wrench-tight with lubricant or sealant.

4.1.1 Thread Designation. The American National Standard Coupling Straight Pipe Threads are designated in accordance with 1.2.1 as follows:

1/8 - 27 NPSC

4.1.2 Dimensions and Limits of Size. The dimensions and pitch diameter limits of size are specified in Table 4. The pitch diameter limits of size correspond to one and one-half turns large or small of the standard taper pipe thread. The major and minor diameters vary with the pitch diameter, as the American National Standard Pipe Thread form is maintained within the truncation tolerances shown in Table 1.

5 SPECIFICATIONS FOR RAILING JOINT TAPER PIPE THREADS, NPTR

5.1 Railing Joints

Railing joints that require a rigid mechanical thread joint may be made with external and internal taper threads.

The external thread is basically the same as the American National Standard Taper Pipe Thread, except that it is shortened to permit the use of the

GENERAL NOTES:

(a) NPSM threads are of Unified screw thread form to Classes 2A/2B tolerances, having the minimum pitch diameter of the internal thread basic and equal to E_1 of NPT threads.

(b) The minor diameters of external threads and major diameters of internal threads are those as produced by commercial straight pipe dies and commercial ground straight pipe taps.

The major diameter of the external thread has been calculated on the basis of a truncation of 0.10825*p*, and the minor diameter of the internal thread has been calculated on the basis of a truncation of 0.21651*p*, to provide no interference at crest and root when product is gaged with gages made in accordance with 9.2.

NOTE:

(1) Column 11 is the same as the pitch diameter at the large end of internal thread, E_1, *Basic*. (See Table 2, col. 8.)

12	12.750	8	12.732	12.6491	12.6374	12.574	12.6569	12.6686

NOTE:

(1) NPSL threads are standard pipe thread form where the pitch diameters of the external threads are fixed at 2.5 and 4 turns larger than basic E_1, and where the pitch diameters of the internal threads are fixed at 5 and 6.5 turns larger than basic E_1, thus providing an allowance equivalent to one turn of the standard taper pipe thread.

As the American National Standard Straight Pipe Thread form of thread is produced by a single tool, the major and the minor diameters of the internal thread and the minor diameter of the external thread are presumed to vary with the pitch diameter. The major diameter of the external thread is usually determined by the diameter of the pipe. These theoretical diameters result from adding the depth of the truncated thread (0.666025 X p) to the maximum pitch diameters in col. 5, and it should be understood that commercial pipe will not always have these maximum major diameters.

The locknut thread is established on the basis of retaining the greatest possible amount of metal thickness between the bottom of the thread and the inside of the pipe.

In order that a locknut may fit loosely on the externally threaded part, an allowance equal to the *increase in pitch diameter per turn* is provided, with a tolerance of 1.5 turns for both external and internal threads.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:43:32 2005

larger end of the pipe thread. See Table 5. The dimensions of these external and internal threads are shown in Table 5. A recess in the fitting provides a covering for the last scratch or sharp edges of incomplete threads on the pipe.

5.1.1 Thread Designation. American National Standard Railing Joint Taper Pipe Threads are designated in accordance with 1.2.1 as follows:

1/2 - 14 NPTR

5.1.2 Form of Thread. The form of the thread is the same as the form of the American National Standard Taper Pipe Thread shown in Fig. 1.

5.1.3 Tolerances on Thread Elements. The gaging of these threads is specified in Table 5. The maximum allowable deviation in the external thread is no turns large and one turn small. The maximum allowable deviation in the internal thread is one turn large, no turns small.

6 SPECIFICATIONS FOR STRAIGHT PIPE THREADS FOR MECHANICAL JOINTS; NPSM, NPSL, NPSH

6.1 Straight Pipe Threads

In addition to pressure-tight pipe joints, for which taper external threads and either taper or straight internal threads are used, there are mechanical joints where straight pipe threads are used to advantage on both external and internal threads. Three of these straight pipe thread joints are covered by this Standard, all of which are based on the pitch diameter of the American National Standard Taper Pipe Thread at the gaging notch (dimension E_1 of Table 2) but have various truncations at crest and root as described below. These three types of joints are as follows:

(*a*) free-fitting mechanical joints for fixtures, Table 6, both external and internal, NPSM.

(*b*) loose-fitting mechanical joints with locknuts, Table 7, both external and internal, NPSL.

(*c*) loose-fitting mechanical joints for hose couplings (ANSI B2.4), NPSH.

6.1.1 Thread Designations. The above types of straight pipe threads for mechanical joints are designated in accordance with 1.2.1 as follows:

1/8 - 27 NPSM
1/8 - 27 NPSL
1 - 11.5 NPSH

6.1.2 Pitch and Flank Angle. The pitch and flank angle are the same as the corresponding dimensions of the taper pipe thread described in Section 3.

6.1.3 Diameter of Thread. The basic pitch diameter for both the external and internal straight pipe threads is equal to the pitch diameter of the American National Standard Taper Pipe Thread at the gaging notch (dimension E_1 of Table 2), which is the same as at the large end of the internal taper pipe thread.

6.2 Free-Fitting Mechanical Joints for Fixtures, NPSM

Pipe is often used for special applications where there are no internal pressures. Where straight thread joints are required for mechanical assemblies, straight pipe threads are often found more suited or convenient.

The dimensions of these threads, as given in Table 6, are for pipe thread connections where reasonably close fit of the mating parts is desired.

6.3 Loose-Fitting Mechanical Joints With Locknuts, NPSL

The American National Standard External Locknut thread is designed to produce a pipe thread having the largest diameter that it is possible to cut on standard pipe. Ordinarily Straight Internal Threads are used with these Straight External Threads, providing a loose fit. The dimensions of these threads are given in Table 7. It will be noted that the maximum major diameter of the external thread is slightly greater than the nominal outside diameter of the pipe. The normal manufacturer's variation in pipe diameter provides for this increase.

One application of a taper pipe thread in combination with a locknut thread which has been in use for some time is that shown in Table 7. It consists of the nipple threaded joint used to connect standpipes with the floor or wall of a water supply tank.

Gaging information for these threads is given in Section 7.

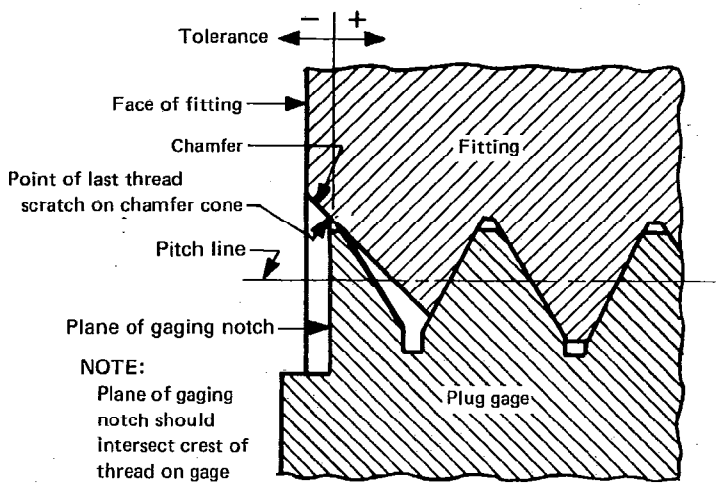
(A) Enlarged view showing chamfered external thread of basic size



(B) Enlarged view showing chamfered internal thread of basic size with chamfer exceeding the major diameter

GENERAL NOTE:
The chamfer illustrated is at 45 deg. angle and is approximately ½ pitch in depth. However, these details are not requirements and are given only for information on the illustration shown. The chamfered portion of thread and the full chamfer cone are indicated by dotted lines.

The reference point for the internal product thread is the starting end of the fitting, providing the chamfer does not exceed the major diameter of the internal thread. When a chamfer on the product thread exceeds this limit, the reference point becomes the last thread scratch on the chamfer cone, as illustrated. Allowance must be made for depth of counterbore on counterbored fittings.

6.4 Loose-Fitting Mechanical Joints for Hose Couplings, NPSH

Hose coupling joints are ordinarily made with straight internal and external loose-fitting threads. There are several standards of hose threads having various diameters and pitches, one of which is based on the American National Standard Pipe Thread. By the use of this thread series, it is possible to join small hose couplings in sizes ½ to 4, inclusive, to ends of standard pipe having American National Standard External Pipe Threads, using a gasket to seal the joint. For dimensions and tolerances, see ANSI B2.4.

7 GAGES AND GAGE TOLERANCES FOR AMERICAN NATIONAL STANDARD PIPE THREADS

7.1 Design of Gages

Gages for American National Standard Pipe Threads provide a functional check and are of the standard type as described below. Gages should conform to the designs recommended in ANSI Standard B47.1, Gage Blanks.

7.1.1 Standard Type Gages. A set of standard or basic type gages consists of a taper-threaded plug gage and a taper-threaded ring gage. See Figs. 4 and 5. The plug gages are made to dimensions given in Table 8 with a gaging notch located a distance L_1 from the small end. The L_1 ring gage has a length equal to dimension L_1. The roots of the threads on these gages shall clear $0.0381p$ width. A sharp V or undercut clearance is acceptable. The crests are to be truncated an amount equal to $0.140p$ for 27 threads per inch (tpi), $0.109p$ for 18 tpi, and $0.100p$ for 14 tpi, 11-1/2 tpi and 8 tpi threads (see Fig. 5). In locating the basic gaging notch, the plane of the notch should intersect the crest of the gage thread.

The ring gage shall be fitted to the plug so that, when assembled handtight, the gaging notch of the plug gage will be flush with the large end face of the ring gage within tolerances as given in Table 9.

Partial end threads shall be removed on both ends of the ring gage and on the small end of the plug gage to full-form profile in order to avoid possible seating error from bent or malformed feathered edge.

7.1.2 Marking of Gages. Each gage shall be marked so as to indicate clearly the nominal size of pipe, threads per inch, and the proper thread series designation as given in the respective section of this Standard.

7.2 Classes of Gages

Gages of the following types may be used to completely cover gage requirements:

(*a*) master gages used to check working gages.

(*b*) working gages used to check threads during manufacture and for conformance inspection.

7.2.1 Master Gages. The set of master gages consists of an L_1 taper threaded plug gage and an L_1 taper threaded ring gage (see Figs. 4 and 5). The plug gage is made to dimensions specified in Table 8. It is constructed of hardened steel with a gaging notch located a distance L_1 (Table 2) from the small end. The ring gage has a length equal to dimension L_1 specified in Table 8. This ring is fitted to its mating plug - seating flush at the notch within ± 0.002 in. for sizes 1/16 through 2, within ± 0.003 in. for sizes 2-1/2 through 12, and within ± 0.005 in. for sizes 14 and larger. The roots of the threads on these ring gages shall clear a $0.0381p$ flat or may be undercut beyond a sharp V. The crests of the plug and ring gage are truncated $0.100p$. The set of master gages is used for checking working gages (see 7.3.2). A supplementary check by optical means should be made of flank angle and form.

CAUTION: It should be understood that only a specifically matched set of masters (L_1 plug and L_1 ring) can be expected to mate with each other within the tolerance specified. There are many characteristics or deviations in gage elements that may combine to cause a significant standoff difference between master gages which are not specifically matched.

7.2.2 Working Gages. Each set of working gages consists of an L_1 taper threaded plug gage and an L_1 taper threaded ring gage and is used for checking the product. These gages are made of hardened steel or equivalent material to dimensions given in Table 8. (See 7.3.2 for tolerance.) In locating the basic notch of the plug gage the plane of the notch should intersect the crest of the thread.

It is to be noted that these gages are truncated at the crest so that they bear only on the flanks of the thread. Thus, although they do not check the crest or root truncations specified in Table 1, they are a satisfactory functional check for the general run of product. When it is deemed necessary to determine

GENERAL NOTE: Gage blanks shall conform to dimensions given in ANSI B47.1. The major diameters of the plug gages and the minor diameters of the ring gages are based upon the truncations specified in 7.1.1.

whether or not such truncations are within the limits specified, or particularly to see that maximum truncation is not exceeded, it is necessary to make further inspection. For this inspection, optics or optical projection is suggested.

7.3 Gage Tolerances

In the manufacture of gages, variations from basic dimensions are unavoidable. Furthermore, gages will wear in use. In order to fix the maximum allowable variations of gages, tolerances have been established. See Table 9 and 7.3.2.

7.3.1 Master Gage Tolerances. The set of master gages should be made to the basic dimensions as accurately as possible, but in no case shall the cumulative deviation exceed one-half of the total cumulative tolerance specified in cols. 13 and 14 of Table 9. Each master gage should be accompanied by a record of the measurements of all elements of the thread and the standoff of master plug to master ring (large end of ring gage to basic notch of plug gage).

7.3.2 Working Gage Tolerances. All gages applied to the product thread, whether in manufacture or inspection, are designated as working gages. All working gages should be made to the basic dimensions specified in Table 8 and within tolerances specified in Table 9. The maximum wear on a working gage shall not be more than the equivalent of one-quarter turn from its original dimensions.

7.4 Relation of Lead and Angle Deviations to Pitch Diameter Tolerances of Gages

When it is necessary to compute from measurements the decimal part of a turn that a gage varies from the basic dimensions, Tables 10 and 11 should be used. Table 10 gives the correction in diameter for angle deviations and Table 11 gives the correction in diameter for lead deviations. These corrections are always added to the pitch diameter in the case of external threads and subtracted in the case of internal threads regardless of whether the lead or angle deviations are either plus or minus.

The diameter equivalent for lead and angle deviations plus the pitch diameter deviation multiplied by 16 gives the longitudinal deviation from basic at the gaging notch. This longitudinal deviation divided by the pitch equals the decimal part of a turn that the gage varies from basic at the gaging notch.

8 GAGING OF TAPER PIPE THREADS

8.1 Gaging External Taper Threads

In gaging external taper threads, the L_1 ring gage, Fig. 6, is screwed handtight on the pipe or external thread. The thread is within the permissible tolerance when the gaging face of the working ring gage is not more than one turn, large or small, from being flush with the end of the thread, as indicated in Fig. 6.

8.2 Gaging Internal Taper Threads

In gaging internal taper threads, the L_1 plug gage, Fig. 4, is screwed handtight into the fitting or coupling. The thread is within the permissible tolerance when the gaging notch of the working plug gage is not more than 1 turn, large or small, from being flush with the end of the thread, as indicated in Fig. 7.

8.3 Gaging Practice

8.3.1 Precautions. In gaging pipe threads it is common practice to tap or rap the part to assure proper seating of the gage in or on the product thread. However, it is first necessary to clean both the gage and the product threads so that they are free of chips, burrs, abrasives, or other foreign materials.

8.3.2 Supplemental Gaging. Gaging of both internal and external threads by use of the L_1 plug and ring gages, illustrated by Figs. 6 and 7, serves to assure conformance to the L_1 elements of the design dimensions. However, conformance to this Standard requires that all basic design dimensions be met within applicable tolerances including extension of the thread elements to provide for wrench-tight make-up. Therefore, in controlling manufacturing practices or as otherwise required, additional methods of measuring or gaging may be employed to supplement L_1 gaging.

8.4 Gaging Chamfered, Countersunk, or Recessed Threads

The reference point for gaging internal product threads depends upon the chamfer diameter. When the internal chamfer diameter exceeds the major diameter of the internal thread, the reference point is the last thread scratch on the chamfer cone. See Fig. 8B. Otherwise, when the internal chamfer diameter does not exceed the major diameter of the internal thread, the reference point is the end of the

GENERAL NOTES:

(a) The large end of the master ring gage shall be flush with the gaging notch of its master plug when assembled handtight within ±0.002 for sizes 1/16 to 2 inclusive, within ±0.003 for sizes 2 1/2 to 12, inclusive, and within ±0.005 for sizes 14 and larger.

(b) The tolerances for the length L_1 from small end to gaging notch of the plug gaged (Fig. 4) shall be + 0.000 and − 0.001 for sizes 1/16 to 2, inclusive, and + 0.000 and − 0.002 for sizes 2 1/2 and larger.

(c) The tolerances for the over-all thread length L_2 of the plug gage (Fig. 4) shall be + 0.050 and − 0.000 for all sizes.

(d) Tolerances for the thickness L_1 of the ring gage (Fig. 4) shall be − 0.000 and + 0.001 for sizes 1/16 to 2, inclusive, and − 0.000 and + 0.002 for sizes 2 1/2 and larger.

NOTES:

(1) To be measured at the gaging notch of plug gage.

(2) Allowable variation in lead between any two threads in L_1 length of gage (Fig. 4).

(3) In solving for the correction in diameter for angle deviations, the average deviation in half angle for the two sides of thread regardless of their signs should be taken.

(4) The lead and taper on plug and ring gages shall be measured along the pitch line omitting the imperfect threads at each end.

(5) Allowable variation in taper in L_1 length of gage (Fig. 4).

(6) Maximum possible interchange standoff, any ring against any plug other than its master plug, may occur when taper deviations are zero and all other dimensions are at opposite extreme tolerance limits. Average standoff should be well within these maximum limits.

45	0.00252	0.00175	0.00144	0.00112	0.00075
50	0.00336	0.00233	0.00192	0.00149	0.00099

GENERAL NOTE: Values given in inches at 68°F.

NOTES:

(1) In solving for the diameter equivalent of angle deviations the average deviation in half included angle for the two sides of the thread regardless of their signs should be taken.

(2) Diameter equivalent = $0.53812p$ tan $\delta\alpha$, where $\delta\alpha$ = deviation in half included angle of thread expressed in minutes.

(3) Table is based upon an NPT gage with $0.1p$ root/crest Truncations with equal half-angle deviations. For other gages with equal truncations, multiply by

$$\frac{0.866p - 2(\text{truncation})}{0.6667p}$$

fitting. An allowance must be made for the depth of counterbore on counterbored fittings.

The reference point for gaging or measuring the length of external product threads is the end of the pipe.

8.4.1 Turns-Engagement Method of Gaging. The turns-engagement method of gaging taper threads with plug and ring pipe thread gages, determines that an adequate number of threads is available at hand engagement, thus avoiding possible complications resulting from gage chamfer and product chamfer. See Table 2, col. 7, for the basic number of turns in the absence of chamfers (e.g., 4.32 turns for 27 tpi), the applicable tolerance being plus or minus one turn (or limits 3.32 to 5.32 turns for 27 tpi).

9 GAGING OF STRAIGHT PIPE THREADS

9.1 Types of Gages

Gages to properly control the production of these straight threads should be either straight GO and HI (Internal) and GO and LO (External) gages or the regular American National Standard Taper Pipe Thread gages as indicated below.

9.1.1 Use of Straight and Taper Gages. Straight GO and HI/LO gages should be used for all types of threaded joints where both the external and internal threads are straight. Taper plug gages should be used for the internal threads of all types of mechanical joints where the external thread is tapered and the internal thread is straight. Taper plug gages used for this purpose should be checked periodically by direct measurement.

9.1.2 Gaging Pressure-tight Joints. Taper thread gages shall be used to gage straight internal pipe threads forming part of pressure-tight joints where the external thread is tapered.

The plane of the gaging notch on the American National Standard Taper Pipe Thread plug gage shall come flush with the end of the American National Standard Coupling Straight Pipe Thread (NPSC) (Table 4) or flush with the last thread scratch on the chamfer cone if chamfered with an internal chamfer diameter in excess of the major diameter of the internal thread (see Fig. 8B). A tolerance of one and one-half turns large or small to gage shall be allowed.

CAUTION: When using a tapered thread plug gage, nonuniformity of gage wear is a particular problem; therefore, taper plug gages used for this application should be checked by direct measurement of thread form and size in addition to checking against a master.

9.2 Gage Dimensions

The straight GO and HI plug gages and the straight GO and LO ring gages used for checking mechanical joint threads, Tables 6 and 7, shall be made to the pitch diameter limits specified in the product tables in accordance with standard practice for straight thread gages as outlined in ANSI B1.2, Gages and Gaging for Unified Screw Threads.

The minimum major diameter of the GO thread plug gage shall be equal to the minimum pitch diameter of the internal thread plus an amount equal to 0.75H (0.649519p). The maximum major diameter of the HI thread plug gage shall be equal to the maximum pitch diameter of the internal thread plus an amount equal to 0.50H (0.433013p).

The maximum minor diameter of the GO thread ring gage shall be equal to the maximum pitch diameter of the external thread minus an amount equal to 0.50H (0.433013p). The minimum minor diameter of the LO thread ring gage shall be equal to the minimum pitch diameter of the external thread minus an amount equal to 0.25H (0.216506p).

See ANSI B1.2 for further details and tolerances for these straight thread gages.

APPENDIX

(This Appendix is not part of American National Standard, Pipe Threads, General Purpose (Inch) ANSI/ASME B1.20.1-198x, but is included for information purposes only.)

Suggested Twist Drill Diameters for Drilled Hole Sizes for Pipe Threads

The drill diameters given in Table 1 are the diameters of the standard and stock drills which are the closest to the minimum minor diameters shown in Table 2, col. 24.

They represent the diameters of the holes which would be cut with a twist drill correctly ground when drilling a material without tearing or flow of metal. This is approximately the condition that exists when a correctly sharpened twist drill is cutting a hole in a homogeneous block of cast iron.

When flat drills are used, the width of the cutting edge may have to be adjusted to produce a hole of the required diameter.

When nonferrous metals and other similar materials are to be drilled and tapped, it may be found necessary to use a drill of slightly larger or smaller diameter to produce a hole of a size that will make it possible for the tap to cut an acceptable pipe thread with the required thread height.

It should be understood that this table of twist drill diameters is intended to help only the occasional user of drills in the application of this Standard. When internal pipe threads are produced in larger quantities in a particular type of material and with specially designed machinery it may be found to be more advantageous to use a drill size not given in the table, even one having a nonstandard diameter.

TABLE A1 SUGGESTED TWIST DRILL DIAMETERS (INCHES) FOR DRILLED HOLE SIZES FOR PIPE THREADS

Nom. Pipe Size	O.D. of Pipe (*D*)	Taper Thread		Straight Pipe Thread (NPSC)[2]
		With use of Reamer	Without use of Reamer	
1	2	3	4	5
1/16	0.3125	A 0.234[1]	C 0.242[1]	1/4 0.250[1]
1/8	0.405	21/64 0.328[1]	Q 0.332[1]	11/32 0.344[1]
1/4	0.540	27/64 0.422[1]	7/16 0.438[1]	7/16 0.438[1]
3/8	0.675	9/16 0.562[1]	9/16 0.562[1]	37/64 0.578[1]
1/2	0.840	11/16 0.688[1]	45/64 0.703[1]	23/32 0.719[1]
3/4	1.050	57/64 0.891[1]	29/32 0.906[1]	59/64 0.922[1]
1	1.315	1 1/8 1.125[1]	1 9/64 1.141[1]	1 5/32 1.156[1]
1 1/4	1.660	1 15/32 1.469	1 31/64 1.484	1 1/2 1.500
1 1/2	1.900	1 45/64 1.703	1 23/32 1.719	1 3/4 1.750
2	2.375	2 11/64 2.172	2 3/16 2.188	2 7/32 2.219
2 1/2	2.875	2 37/64 2.578	2 39/64 2.609	2 21/32 2.656

GENERAL NOTE: The use of twist drills of the diameters listed will not assure completely formed threads over the entire L_1 length.

NOTES:

(1) American National Standard twist drill sizes in accordance with ANSI B94.11, applicable to commercial threads only.

(2) Twist drill diameters for NPSM, NPSL and NPSH threads may be larger to suit the increased internal minor diameters established for these threads. Refer to Tables 6 and 7 in this Standard and Table 3 in ANSI B2.4, Hose Coupling Screw Threads.

Date of Issuance: March 19, 1999

The 1998 edition of this Standard is being issued with an automatic addenda subscription service. The use of addenda allows revisions made in response to public review comments or committee actions to be published on a regular yearly basis; revisions published in addenda will become effective 6 months after the Date of Issuance of the addenda. The next edition of this Standard is scheduled for publication in 2003.

ASME issues written replies to inquiries concerning interpretations of technical aspects of this Standard. The interpretations will be included with the above addenda service.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assumes any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which precludes the issuance of interpretations by individual volunteers.

FOREWORD

(This Foreword is not part of ASME B16.1-1998.)

In 1894, the American Society of Mechanical Engineers (ASME) adopted a standard flange template ("ASME Standard") for low-pressure service. A "Manufacturers Standard" for pressures up to 250 psi followed in 1901. Around 1910, a group of fittings manufacturers formed an organization that was the forerunner of the present Manufacturers Standardization Society of the Valve and Fittings Industry (MSS) and undertook the design of a line of flanged fittings. A document covering this work was published in 1912.

During the years 1912–1914, a Joint Committee of the ASME and the Manufacturers Committee formulated compromise standard dimensions for pipe flanges and flanged fittings for use under saturated steam pressures of 125 psi and 250 psi pressure ranges. The Joint Committee's report was accepted at a conference attended by representatives of ASME, the Manufacturers Committee, the U.S. government, and the National Association of Master Steam and Hot Water Fitters. ASME published this report as the "American Standard for Pipe Flanges, Fittings and Their Bolting" in 1914. In 1918, work was started on standards for 50 lb steam flanges and for 800 lb, 1200 lb, and 3000 lb hydraulic flanges, which were subsequently approved by this group.

In 1921, the American Engineering Standards Committee, later known as the American Standards Association (ASA), United States of America Standards Institute (USAS), and more recently, the American National Standards Institute (ANSI), organized Sectional Committee B16 to unify and further develop national standards for pipe flanges and fittings (and later for valves and gaskets). Cosponsors of the B16 Committee were ASME, MSS, and the Heating and Piping Contractors Association [now the Mechanical Contractors Association of America (MCAA)]. Work already in progress on flanges and flanged fittings was assigned to Subcommittee 1 (now Subcommittee A). Following approval by the Subcommittee, the B16 Committee, the cosponsors, and ASA, the standards were published in 1928.

In later work, Subcommittee 1 developed the 25 lb Flange and Flanged Fitting Standard (approved in 1931 as ASA B16b2), which replaced the 50 lb standard that had been originally approved in 1918. Work on the 800 lb Hydraulic Flange Standard was published as ASA B16b1 in 1931. Revision of thicknesses, tolerances, and service pressure ratings of the 125 lb and 250 lb flanges and flanged fittings led to approval and publication of ASA B16a-1939.

An American War Standard entitled "Pressure Ratings for Cast Iron Flanges and Flanged Fittings, 125 lb" (ASA B16a1) was published in 1943. A complete review of the 125 lb and 250 lb standards resulted in new editions of each: ASA B16.1-1948 and ASA B16.2-1948. In 1960, editions of B16.1 and B16.2 were issued in which ratings were presented in graphic form and special requirements were added for testing flanges.

A review of all cast iron flange and flanged fittings standards initiated in 1962 resulted in the withdrawal of B16.16, "300 lb Refrigerant Flanges and Flanged Fittings" and the combining of the remaining standards into a single document, with B16.1 and B16.2 coming together as USAS B16.1-1967. In this edition, the presentation of ratings was restored to tabular form.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:14 2005

The increasing use of higher grades of cast iron necessitated the establishment of a second set of ratings for the smaller sizes. A revised edition published as ANSI B16.1-1975 incorporated these new ratings along with metric (SI) equivalents for dimensions and minor corrections to the 1967 edition text.

In 1982, American National Standards Committee B16 was recognized as an ASME Committee operating under procedures accredited by ANSI. Following approval by the ASME B16 Subcommittee A and B16 Committee, ANSI approved ASME/ANSI B16.1-1989 on March 8, 1989. Changes included revised marking requirements, revised bolt length increments ($\frac{1}{2}$ in. rather than $\frac{1}{4}$ in.), elimination of metric equivalents, a correction of the Class 800 flange raised face height to 0.25 in. from the 0.06 in. shown previously, and editorial changes to the text.

In the 1998 edition of ASME B16.1, Reference Standards have been updated, a Quality System Program Annex has been added, Class 800 has been deleted, and several editorial revisions have been made. Following approval by ASME B16 Subcommittee B and B16 Main Committee, ANSI approved this American National Standard on November 20, 1998.

Requests for interpretation or suggestions for revision should be sent to the Secretary, B16 Committee, The American Society of Mechanical Engineers, Three Park Avenue, New York, NY 10016-5990.

RATINGS OF ASME B16.1 VERSUS ANSI/AWWA A21.10

Attention is directed to an apparent conflict in ambient temperature pressure ratings for flanged fittings between ASME B16.1 and ANSI/AWWA A21.10, Gray Iron and Ductile Iron Fittings, 2 in. through 48 in. for Water and Other Liquids.

The scope of ANSI/AWWA A21.10 limits that standard to fittings for use with gray iron and ductile iron pipe for water and other liquids at rated working pressures of 150 psi and 250 psi. The ratings of these fittings were established on the basis of hydrostatic testing of fittings to bursting, and do provide a factor of safety of at least 3.0 at the rated working pressure and at ambient temperature.

ASME B16.1 covers both separate flanges and flanged fittings for more general service at ambient and elevated temperatures. The pressure ratings set forth are not based upon burst strength, but have evolved over an extended period of time of satisfactory performance in a wide range of general service conditions. The ratings encompass pressure combined with elevated temperature, stresses imposed by piping, thermal stresses due to temperature variations, and many other conditions causing stress in the flange or fitting.

CAST IRON PIPE FLANGES AND FLANGED FITTINGS
Classes 25, 125, and 250

1 SCOPE

1.1 General

This Standard for Classes 25, 125, and 250 Cast Iron Pipe Flanges and Flanged Fittings covers:

(a) pressure–temperature ratings

(b) sizes and method of designating openings of reducing fittings

(c) marking

(d) minimum requirements for materials

(e) dimensions and tolerances

(f) bolt, nut, and gasket dimensions

(g) tests

1.2 References

Standards and specifications adopted by reference in this Standard are shown in Annex I, which is part of this Standard.

1.3 Quality Systems

Requirements relating to the product manufacturer's Quality System Programs are described in Annex A.

2 PRESSURE–TEMPERATURE RATINGS

2.1 General

Pressure ratings for various temperatures (including limitations) are shown in Table 1.

2.2 Ratings

Ratings are independent of the contained fluid and are the maximum nonshock pressures at the tabulated temperatures. Intermediate ratings may be obtained by linear interpolation between the temperatures shown.

2.3 Rating Temperature

Temperatures shown for the corresponding pressure rating shall be the material temperature of the pressure-retaining structure. It may be assumed that the material temperature is the same as the fluid temperature. Use of a pressure rating at a material temperature other than that of the contained fluid is the responsibility of the user and subject to the requirements of any applicable code.

2.4 Low-Temperature Ratings

Pressure ratings for temperatures below −20°F should be determined in accordance with low-temperature properties of cast iron (ASTM A 126) as governed by applicable codes.

3 SIZE

3.1 Nominal Pipe Size

The sizes of the flanges and fittings shown in Figs. 2 through 9 and scheduled in Tables 2 through 9 are identified by the corresponding nominal pipe sizes. NPS as used in this document means the nominal pipe size.

3.2 Reducing Fittings

Reducing fittings shall be designated by the size of the openings in their proper sequence as indicated in the sketches of Fig. 1.

4 MARKING

4.1 Fittings

The manufacturer's name or trademark and numerals as shown below for each rating shall be cast on the exterior surface of all fittings.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:15 2005

Rating Class	Size	Numeral
25	All	25
125	1 to 12	125
	14 to 24	100
	30 to 48	50
250	1 to 12	250
	14 to 24	200
	30 to 48	100

4.2 Flanges

The manufacturer's name or trademark shall be cast on all loose flanges. In addition, numerals 25 shall be cast on Class 25 flanges. Rating numerals for other classes shall be cast on loose flanges that are subject to the requirements of para. 4.3.

4.3 Material Class

In those sizes and classes where both Classes A and B iron can be used, the letter A or B shall be cast on both flanges and fittings adjacent to the rating numerals. Flanges and fittings with no A or B Class iron marking shall be considered as Class A iron for rating purposes.

5 MATERIALS

5.1 Castings

The castings shall meet the requirements of ASTM A 126 as listed in para. 5.1.1.

5.1.1 The material requirements for flanges and flanged fittings shall be as follows:

Rating Class	Size	Class of Iron ASTM A 126
25	All	A
125	1 to 12	A or B
	14 and above	B
250	1 to 12	A or B
	14 and above	B

5.2 Bolting

The bolting used with these flanges and fittings shall be made of carbon steel that conforms to the requirements of ASTM A 307 Grade B[1] and used with ring-type gaskets.

6 FITTING DIMENSIONS AND TOLERANCES

6.1 Wall Thickness

It is recognized that some variations are absolutely unavoidable in the making of patterns and castings. Equipment shall be designed to produce wall thicknesses given in the tables. Wall thickness at no point shall be less than 87.5% of the thickness given in the tables.

6.2 Facing

6.2.1 Classes 25 and 125 cast iron flanges and flanged fittings shall be flat faced (i.e., without projection or raised face) and finished in accordance with MSS SP-6.

6.2.2 Class 250 flanges and flanged fittings shall have a raised face 0.06 in. high of the diameters given in Table 6 and finished in accordance with MSS SP-6. The raised face is included in the minimum flange thickness and center-to-face dimension.

6.3 Center-to-Face Dimensions

6.3.1 Side Outlet Fittings. Side outlet elbows, side outlet tees, and side outlet crosses shall have all openings on intersecting centerlines. Long-radius elbows with side outlet shall have the side outlet on the radial centerline of the elbow.

6.3.2 Elbows

(a) The center-to-face dimensions for straight-size 90 deg. elbows, 90 deg. long-radius elbows, 45 deg. elbows, side-outlet 90 deg. elbows, and double-branch elbows are shown in Tables 3, 5, and 7.

(b) Reducing 90 deg. elbows, reducing 90 deg. long-radius elbows, reducing side-outlet 90 deg. elbows, and reducing double-branch elbows shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening.

[1] For Classes 25 and 125 flanges: The carbon steel bolts prescribed for the flanges in this Standard are based on the use of a flat "ring" gasket that extends to the bolts.

Where cast iron to cast iron flanges or cast iron to steel flanges are used with full-face gaskets, higher strength bolts may properly be used.

Where cast iron flanges are bolted to steel flanges and flat ring gaskets are used, carbon steel bolts prescribed in this Standard shall be employed.

STD.ASME B16.1-ENGL 1998 ■ 0759670 0608193 5T0 ■

(c) For 90 deg. long-radius elbows with side outlet, the center-to-face dimensions of the side outlet shall be the same as dimension *A* in Tables 3, 5, and 7 for a straight-size 90 deg. elbow corresponding to the size of the largest opening.

(d) Special-degree elbows ranging from 1 deg. to 45 deg., inclusive, shall have the same center-to-face dimensions as those for 45 deg. elbows; those over 45 deg. and up to 90 deg., inclusive, shall have the same center-to-face dimensions as those for 90 deg. elbows. The angle designation of an elbow is the angle between the flange faces.

6.3.3 Tees, Crosses, and Laterals

(a) The center-to-face dimensions for straight-size tees and crosses, with or without side outlet, and laterals are shown in Tables 3, 5, and 7.

(b) Reducing tees and reducing crosses, with or without side outlet, and reducing laterals, NPS 16 and smaller, shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening. For NPS 18 and larger, if the outlet of a reducing tee; the branch of a reducing lateral; or the largest outlet of a reducing side outlet tee, reducing cross, and reducing side outlet cross is the same size or smaller than given in Tables 3, 5, and 7 (short body pattern), the center-to-face dimensions shown in these Tables shall be used. If a branch or any outlet is larger than shown in Tables 3, 5, and 7, the center-to-face dimensions shall be the same as for the straight-size fitting shown in Tables 3, 5, and 7 corresponding to the size of the largest opening. Tees, crosses, and laterals, reducing on the run only, shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening.

(c) Tees reducing on both runs are generally known as bull-head tees and have the same center-to-face dimensions as straight-size fittings corresponding to the size of the outlet.

6.3.4 True Ys. Center-to-face dimensions for straight-size true Ys are shown in Tables 5 and 7. Reducing sizes are considered special and should be made to suit conditions.

6.3.5 Reducers and Eccentric Reducers. The face-to-face dimensions for all reductions of reducers and eccentric reducers shall be the same as given in Tables 5 and 7 for the largest opening.

6.4 Center-to-Face Tolerances

The following tolerances shall be permitted on all center-to-contact surface dimensions of fittings: Tolerances for contact surface-to-contact surface dimensions shall be twice those given below. The largest opening in the fitting governs the tolerance to be applied to all openings.

Nominal Pipe Size	Tolerance Plus or Minus, in.
10 and smaller	0.03
12 and larger	0.06

6.5 Threaded Flanges

6.5.1 General. Flanges shall have a Standard Taper Pipe Thread in accordance with ASME B1.20.1. The thread shall be concentric with the axis of the flange, and variations in alignment shall not exceed 0.06 in./ft. The gaging notch of working gage should come flush with the bottom of chamfer, and the maximum allowable thread variations are one turn large or one turn small from the gaging notch.

6.5.2 Class 125. Threads shall be countersunk a distance not less than one-half of the pitch of the thread at an angle approximately 45 deg. with the axis of the thread, for the purpose of easy entrance in making the joint and protection of the threads. Countersinking shall be concentric with the threads. The length of the threads shall be measured to include the countersink.

6.5.3 Class 250. Hub may be recessed. When not recessed, threads shall be countersunk a distance not less than one-half of the pitch of the thread at an angle approximately 45 deg. with the axis of the thread at the back of the flange. If hub is recessed, threads shall be 45 deg. countersunk to diameter of recess. The purpose is for easier entrance in making a joint and for the protection of the threads. Countersinking shall be concentric with the threads. The length of threads shall be measured to include the countersink.

6.6 Flange Bolt Holes

Flange bolt holes shall be in accordance with the dimensions shown in Tables 2, 4, and 6. Pairs of bolt holes shall straddle the centerline.

STD.ASME B16.1-ENGL 1998 ■ 0759670 0608194 437 ■

6.7 Spot Facing

All flanges and flanged fittings covered by this Standard shall have bearing surfaces for bolting that are parallel to the flange face within 3 deg. Any back facing or spot facing required to accomplish parallelism shall not reduce the flange thickness Q below the dimensions given in Tables 2 through 7. Flange thickness at any point within the spot face area, as defined in MSS SP-9, shall not exceed the required minimum thickness by more than the following amounts.

Nominal Pipe Size	Excess Thickness, Max., in.
2 to 12	0.12
14 to 24	0.18
30 to 96	0.25

When required, all spot facing shall be done in accordance with MSS SP-9. Sharp corners shall be avoided in back facing.

6.8 Crosses and Lateral Reinforcement

Crosses and laterals (Y-branches) both straight and reducing shall be reinforced where necessary to compensate for the inherent weakness in the shape of these fittings.

6.9 Drain Tappings

Holes may be tapped in the wall of fittings if the metal thickness is sufficient to provide the effective length of thread as shown in Fig. 10 and as specified in Table 10. Where thread length is insufficient due to metal thickness or size of tapping is such that reinforcement of opening is necessary, an integral boss should be added. In no case shall the effective length of thread A be less than that shown in Table 10. These lengths are equal to the effective thread lengths as shown in ASME B1.20.1.

The method of designating the locations of the tapped holes for drains is shown in Fig. 11. Each possible location is designated by a letter so that desired locations for the various types of fittings may be definitely specified without the use of further sketches or description. For further detail in applying tappings, see MSS SP-45.

7 BOLT, NUT, AND GASKET DIMENSIONS

7.1 Bolting

Carbon steel bolts smaller than 0.75 in. shall have (ASME B18.2.1) square heads or (ASME B18.2.1) heavy hex heads, and shall have (ASME B18.2.2) heavy hex nuts.

Carbon steel bolts 0.75 in. and larger shall have (ASME B18.2.1) square heads or (ASME B18.2.1) hex heads and shall have (ASME B18.2.2) hex nuts or (ASME B18.2.2) heavy hex nuts or (ASME B18.2.2) square nuts. For bolt sizes 1.5 in. and larger, stud bolts with a nut on each end are recommended.

All bolts or (stud bolts) and all nuts shall be threaded in accordance with the Unified Screw Threads, standard coarse thread series (ASME B1.1) with Class 2A for bolts and Class 2B for nuts.

7.2 Gaskets[1]

Flat ring gaskets shall be in accordance with dimensions given in ASME B16.21 for nonmetallic gaskets for pipe flanges.

8 HYDROSTATIC TESTS

Tests are not required unless specified by the user.

(a) Fittings. Fittings shall be capable of withstanding, without showing leaks, the hydrostatic test pressures listed in Table 1 for the material and maximum working pressure of the item tested. These test pressures are 1.5 times the cold working pressure rate rounded to the next higher 10 psi in Table 1.

(b) Flanges. Flanges integral with or attached to equipment may be hydrostatically tested by the purchaser at his responsibility at pressures higher than specified herein.

9 CERTIFICATIONS

The manufacturer shall be able to certify that products are in conformance with the requirements of this Standard when required on the purchase order.

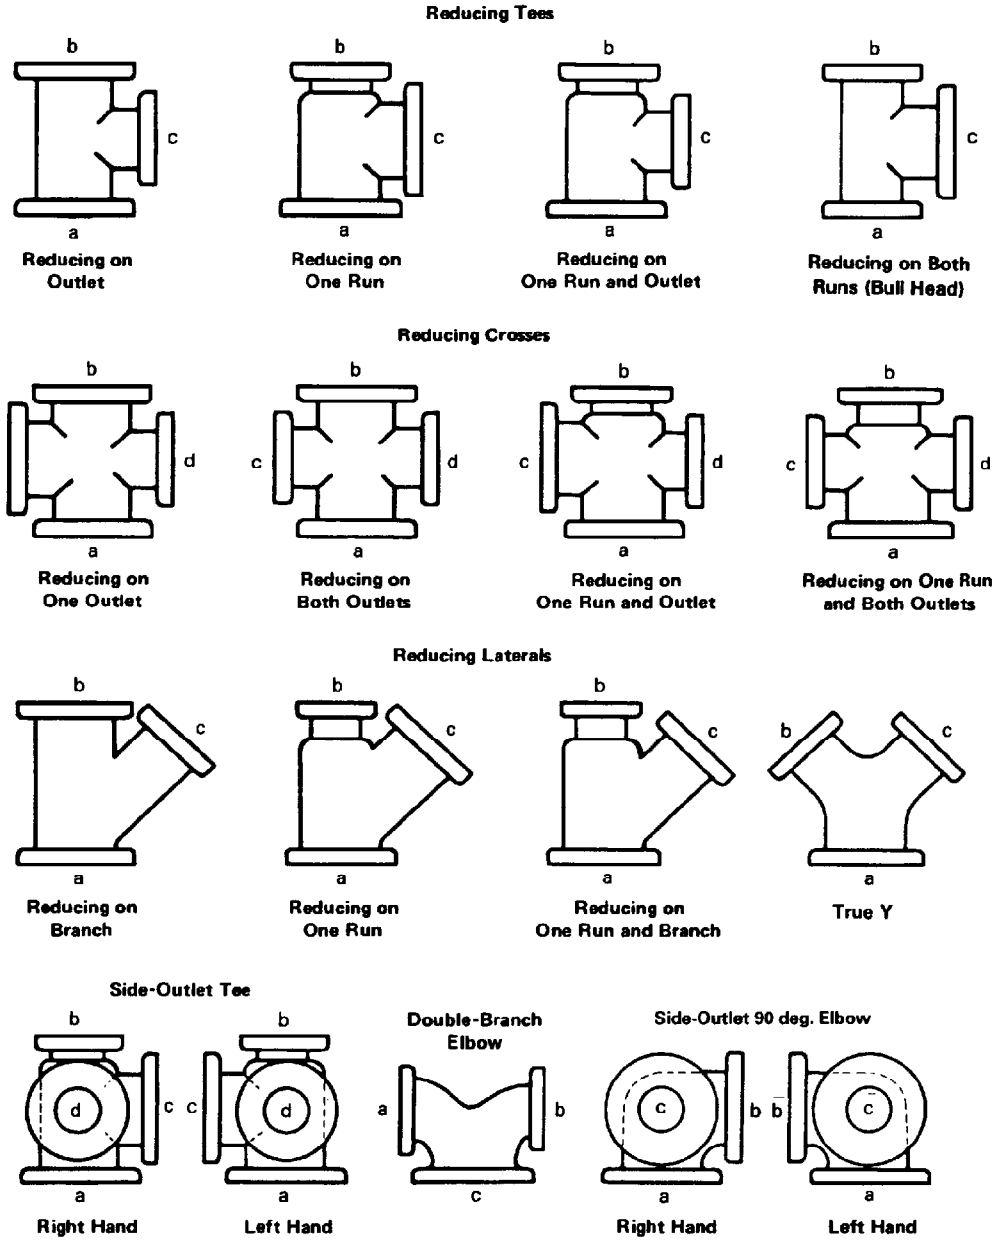
GENERAL NOTES:
(a) Pressure is in lb/sq in. gage.
(b) NPS is nominal pipe size.

NOTES:
(1) Limitations:
  (a) Class 25. When Class 25 cast iron flanges and flanged fittings are used for gaseous service, the maximum pressure shall be limited to 25 psig. Tabulated pressure–temperature ratings above 25 psig for Class 25 cast iron flanges and flanged fittings are applicable for nonshock hydraulic service only.
  (b) Class 250. When used for liquid service, the tabulated pressure–temperature ratings in NPS 14 and larger are applicable to Class 250 flanges only and not to Class 250 fittings.
(2) 353°F (max.) to reflect the temperature of saturated steam at 125 psig.
(3) 406°F (max.) to reflect the temperature of saturated steam at 250 psig.
(4) Hydrostatic tests are not required unless specified by the user.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:17 2005



GENERAL NOTE:
The largest opening establishes the basic size of a reducing fitting. The largest opening is named first, except for bull-head tees, which are reducing on both runs, and double-branch elbows where both branches are reducing; the outlet is the largest opening and named last in both cases.

In designating the openings of reducing fittings, they should be read in the order indicated by the sequence of the letters a, b, c, and d. In designating the outlets of side-outlet reducing fittings, the side outlet is named last; and in the case of the cross (which is not shown), the side outlet is designated by the letter e.

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing, see para. 6.2.1.

(2) Threaded companion flanges should not be thinner than the Class 125 thickness on NPS 24 and smaller. Other types of flanges may have thicknesses as given above.

(3) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.

(4) For spot facing, see para 6.7.

(5) For flange bolt holes, see para. 6.6.

(6) For bolts and nuts, see para. 7.1.

72	86.50	2.50	1.62	72	53.0	94.00	36.0	48.0	40.0	48.0

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing, see para. 6.2.1.
(2) For flange bolt holes, refer to Table 2; see also para. 6.6.
(3) For spot facing, see para. 6.7.
(4) For center-to-face tolerances, see para. 6.4.
(5) For intersecting centerlines of side outlets, see para. 6.3.1.
(6) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.
(7) The center-to-face dimensions of fittings are the same as the Class 125.
(8) For wall thickness tolerance, see para. 6.1.
(9) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
(10) Tees and crosses, reducing on run only, carry same dimensions center-to-face and face-to-face as a straight-size fitting of the larger opening.
(11) For reinforcement of crosses, see para. 6.8.
(12) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
(13) Fittings reducing on the run only carry same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. Tees increasing on outlet, known as bull-head tees, will have same center-to-face and face-to-face dimensions as a straight fitting of the size of the outlet. For example, an NPS 12 × NPS 12 × NPS 18 tee will be governed by the dimensions of the NPS 18 long-body tee, given in Table 3, namely NPS 16½ center-to-face of all openings and NPS 33 face-to-face.
(14) Side-outlet tees, with outlet at 90 deg. or any other angle, straight or reducing, carry same dimensions center-to-face and face-to-face as regular tees having same reductions.
(15) In a side-outlet tee, the larger of the two side outlets governs the center-to-face dimension *J*.
(16) Tees, side-outlet tees, and crosses, NPS 16 and smaller, reducing on the outlet, have the same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. NPS 18 and larger, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in Table 3.
(17) Long-body patterns are used when outlets are larger than given above and, therefore, have the same dimensions as straight-size fittings.

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing, see para. 6.2.1.
(2) For thread of threaded flanges, see paras. 6.5.1 and 6.5.2.
(3) All blind flanges NPS 12 and larger must be dished with inside radius equal to the port diameter.
(4) For wall thickness tolerance, see para. 6.1.
(5) For flange bolt holes, see para. 6.6.
(6) For spot facing, see para. 6.7.
(7) For bolts and nuts, see para. 7.1.
(8) Bolt lengths to be compensated for when bolting steel to cast iron flanges.
(9) These sizes are included for convenience. Pressure–temperature ratings are the user's responsibility.

TABLE 5 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing, see para. 6.2.1.
(2) For flange bolt holes, refer to Table 4 and para. 6.6.
(3) For spot facing, see para. 6.7.
(4) For wall thickness tolerances, see para. 6.1.
(5) For center-to-face tolerances, see para. 6.4.
(6) For intersecting centerlines of side-outlet fittings, see para. 6.3.1.
(7) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
(8) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
(9) For reinforcement of crosses and laterals, see para. 6.8.
(10) For face-to-face dimensions of reducers and eccentric reducers, see para. 6.3.5.
(11) For center-to-face dimensions of tees and crosses having outlets and laterals having branches larger than given above, see para. 6.3.3(b).
(12) For center-to-face dimensions of tees, crosses, and laterals reducing on run only, see para. 6.3.3(b).
(13) For center-to-face dimensions of tees reducing on both runs, known as bull-head tees, see para. 6.3.3(b).
(14) For center-to-face dimensions of reducing side-outlet tees and crosses having two different size reductions on the outlets, see para. 6.3.3(b).
(15) Bases are furnished only when specified by the purchaser.
(16) For tees, sizes larger than 24 in., anchorage fittings are recommended. See Table 8.
(17) The base dimension applies to all straight and reducing sizes.
(18) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of the fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(19) Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

(continued)

TABLE 6 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facings, see para. 6.2.2.
(2) All blind flanges for NPS 10 and larger must be dished with inside radius equal to the port diameter.
(3) For wall thickness tolerance, see para. 6.1.
(4) For thread of threaded flanges, see paras. 6.5.1 and 6.5.3.
(5) For flange bolt holes, see para. 6.6.
(6) For bolts and nuts, see para. 7.1.
(7) For spot facing, see para. 6.7.
(8) When bolting to steel flanges, longer bolts or studs shall be used.
(9) Fittings in these sizes are not produced and used in sufficient quantities to warrant standardization; however, the flange dimensions are included for convenience where special fittings larger than NPS 30 are required. When these fittings are made, the body structure should be designed to be the equivalent of the flanges in service pressure ratings.

STD·ASME B16·1-ENGL 1998 ■ 0759670 0608214 055 ■

TABLE 7 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing, see para. 6.2.2.
(2) For flange bolt holes, refer to Table 6 and para. 6.6.
(3) For spot facing, see para. 6.7.
(4) Tolerance of the diameter of the raised face is equal to ±0.03 in.
(5) For center-to-face tolerances, see para. 6.4.
(6) For intersecting centerlines of side-outlet fittings, see para. 6.3.1.
(7) For wall thickness tolerances, see para. 6.1.
(8) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
(9) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
(10) For reinforcement of crosses and laterals, see para. 6.8.
(11) For center-to-face dimensions of tees and crosses having outlets and laterals having branches larger than given above, see para. 6.3.3(b).
(12) For face-to-face dimensions of reducers and eccentric reducers, see para. 6.3.5.
(13) For center-to-face dimensions of tees reducing on both runs, known as bull-head tees, see para. 6.3.3(c).
(14) For center-to-face dimensions of reducing side-outlet tees and crosses having two different size reductions on the outlet, see para. 6.3.3(b).
(15) For center-to-face dimensions of tees, crosses, and laterals reducing on run only, see para. 6.3.3(b).
(16) Bases are furnished only when specified by purchaser.
(17) The base dimensions apply to all straight and reducing sizes.
(18) For tees, sizes larger than NPS 24, anchorage fittings are recommended. See Table 9.
(19) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of the fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(20) Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) Bases are furnished only when specified by the purchaser.

(2) For tee dimensions, refer to Table 5.

(3) For NPS 18 and larger, if the outlet is the same size or smaller than given for reducing tees, the base dimensions shown in this Table shall be used. If the outlet is larger than shown for reducing tees, the base dimensions shall be the same as for the straight-size tee, corresponding to the size of the largest opening.

(4) Tees reducing on run only shall have the same base dimensions as straight-size tees, corresponding to the size of the largest opening.

ANNEX A
QUALITY SYSTEM PROGRAM

(This Annex is a nonmandatory part of ASME B16.1-1998 and is provided for informational purposes only.)

The products manufactured in accordance with this Standard shall be produced under a quality system program following the principles of an appropriate standard from the ISO 9000 series.[1] A determination of the need for registration and/or certification of the product manufacturer's quality system program by an independent organization shall be the responsibility of the manufacturer. The detailed documentation demonstrating program compliance shall be available to the purchaser at the manufacturer's facility. A written summary description of the program utilized by the product manufacturer shall be available to the purchaser upon request. The product manufacturer is defined as the entity whose name or trademark appears on the product in accordance with the marking or identification requirements of this Standard.

---

[1] The series is also available from the American National Standards Institute (ANSI) and the American Society for Quality (ASQ) as American National Standards that are identified by a prefix "Q" replacing the prefix "ISO." Each standard of the series is listed under Annex I.

Date of Issuance: October 26, 1998

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assumes any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

ASME B16.5a–1998

Following approval by the ASME B16 Committee and ASME, and after public review, ASME B16.5a-1998 was approved by the American National Standards Institute on February 20, 1998.

Addenda to the 1996 edition of ASME B16.5 are issued in the form of replacement pages. Revisions, additions, and deletions are incorporated directly into the affected pages. It is advisable, however, that this page, the Addenda title and copyright pages, and all replaced pages be retained for reference.

SUMMARY OF CHANGES

This is the first Addenda to be published to ASME B16.5-1996.

Replace or insert the pages listed. Changes given below are identified on the pages by a margin note, **(a)**, placed next to the affected area. The pages not listed are the reverse sides of the listed pages and contain no changes.

PIPE FLANGES AND FLANGED FITTINGS

1 SCOPE

1.1 General

This Standard covers pressure–temperature ratings, materials, dimensions, tolerances, marking, testing, and methods of designating openings for pipe flanges and flanged fittings in sizes NPS ½ through NPS 24 and in rating Classes 150, 300, 400, 600, 900, 1500, and 2500. Flanges and flanged fittings may be cast, forged, or (for blind flanges and certain reducing flanges only) plate materials as listed in Table 1A.

Requirements and recommendations regarding bolting and gaskets are also included.

1.2 References

(a) **1.2.1 Referenced Standards.** Standards and specifications adopted by reference in this Standard are shown in Annex H, which is part of this Standard. It is not considered practical to identify the specific edition of each standard and specification in the individual references. Instead, the specific edition reference is identified in Annex H. A flange or flanged fitting manufactured in accordance with earlier editions of the referenced standards and in all other respects conforming to this Standard will be considered to be in conformance with this Standard.

1.2.2 Codes and Regulations. A flange or flanged fitting used under the jurisdiction of the ASME Boiler and Pressure Vessel Code, the ASME Code for Pressure Piping, or a governmental regulation is subject to any limitation of that code or regulation. This includes any maximum temperature limitation, or rule governing the use of a material at low temperature, or provisions for operation at a pressure exceeding the pressure–temperature ratings in this Standard.

1.3 Applicable Ratings

The pressure–temperature ratings in this Standard are applicable upon its publication to all flanges and flanged fittings within its scope which otherwise meet its requirements. For unused flanges or flanged fittings maintained in inventory, the manufacturer of the flange or flanged fittings may certify conformance to this Edition provided he can demonstrate that all requirements of this Edition have been met. Where such components were installed in accordance with the pressure–temperature ratings of an earlier edition of this Standard, those ratings are applicable except as may be governed by the applicable code or regulation (see para. 1.2.2).

1.4 User Accountability

This Standard cites duties and responsibilities that are to be assumed by the user in the areas of application, installation, hydrostatic testing, operation, and material selection.

1.5 Quality Systems

Nonmandatory requirements relating to the product manufacturer's Quality System Program are described in Annex G.

2 PRESSURE–TEMPERATURE RATINGS

2.1 Ratings Basis (a)

Ratings are maximum allowable working gage pressures at the temperatures shown in Table 2 for the applicable material and rating. For intermediate temperatures, linear interpolation is permitted. See Annex D for methods of establishing pressure–temperature ratings.

2.2 Ratings of Flanged Joints

A flanged joint is composed of three separate and independent, although interrelated components: the flanges, the gasket, and the bolting, which are assembled by yet another influence, the assembler. Proper controls must be exercised in the selection and application for all these elements to attain a joint which has acceptable leak tightness. Special techniques, such as controlled bolt tightening, may be necessary to achieve a tight joint in service.

Ratings in this Standard apply to flanged joints which conform to the limitations on bolting in para. 5.3 and on gaskets in para. 5.4, and which are made up in accordance with good practice for alignment and assembly. See also para. 2.4. Use of the ratings for flanged joints not conforming to these limitations is the responsibility of the user. Requirements for alignment and assembly of joints are not given in this Standard.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:51 2005

If the two flanges in a flanged joint do not have the same pressure–temperature ratings, the rating of the joint at any temperature is the lower of the two flange ratings at that temperature.

2.3 Rating Temperature

The temperature shown for a corresponding pressure rating is the temperature of the pressure-containing shell of the flange or flanged fitting. In general, this temperature is the same as that of the contained fluid. Use of a pressure rating corresponding to a temperature other than that of the contained fluid is the responsibility of the user, subject to the requirements of the applicable code or regulation. For any temperature below −20°F, the rating shall be no greater than the rating shown for −20°F.

2.4 Temperature Considerations

Application of the ratings in this Standard to flanged joints at both high and low temperatures shall take into consideration the risk of leakage due to forces and moments developed in the connected piping or equipment. The following provisions are intended to minimize these risks.

2.4.1 Flange Attachment. Socket welding and threaded flanges are not recommended for service above 500°F or below −50°F if severe thermal gradients or thermal cycling are involved.

2.4.2 High Temperature Service. At temperatures in the creep range, gradual relaxation of flanges, bolts, and gaskets may progressively reduce bolt loads. It may be necessary to arrange for periodic tightening of bolts to prevent leakage. Joints subject to substantial thermal gradients may require the same attention.

When used above 400°F, Class 150 flanged joints may develop leakage unless care is taken to avoid imposing severe external loads and/or severe thermal gradients. For other classes, similar consideration should be given above 750°F.

2.4.3 Low Temperature Service. The user should recognize that some of the material listed in the rating tables undergo sufficient decrease in toughness at low temperatures that they cannot safely sustain shock loadings, sudden changes of stress or temperature, or high stress concentrations.

2.5 System Hydrostatic Test

Flanged joints and flanged fittings may be subjected to system hydrostatic tests at a pressure not to exceed 1.5 times the 100°F rating rounded off to the next higher 25 psi. Testing at any higher pressure is the responsibility of the user, subject to the requirements of the applicable code or regulation.

2.6 Welding Neck Flanges

Ratings for welding neck flanges covered by this Standard are based upon their hubs at the welding end having thickness at least equal to that calculated for pipe having 40.0 ksi specified minimum yield strength. (For higher strength pipe with thinner wall, see MSS SP-44.) The ratings also apply to such flanges used with components of unequal strength and unequal wall thickness when the attachment weld is made in accordance with the applicable code or regulation. See Figs. 12, 13, and 14.

2.7 Multiple Material Grades

Materials for flanges and flanged fittings may meet the requirements for more than one specification or grade of a specification listed in Table 1A. In that event, the pressure–temperature ratings for any of these specifications or grades may be used provided that marking is in accordance with para. 4.1.2(d).

3 SIZE

3.1 Nominal Size

The size of a flange or flanged fitting covered by this Standard is its nominal pipe size, NPS. The diameter of a bolt is its nominal size. Use of "nominal" indicates that the stated size or dimension is only for designation, not measurement. The actual dimension may or may not be the nominal size and is subject to established tolerances.

3.2 Reducing Fittings

Reducing fittings shall be designated by the size of the openings in their proper sequence as indicated in the sketches of Fig. 2.

3.3 Reducing Flanges

Reducing flanges shall be designated by the two nominal pipe sizes. See examples in Note (4) of Table 7.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:51 2005

6.8.2 Hub Dimensions

6.8.2.1 Threaded, Socket Weld, and Slip-On Flanges. The hub dimensions shall be at least as large as those of the standard flange of the size to which the reduction is being made. The hub may be larger or omitted as detailed in Table 7.

6.8.2.2 Welding Neck Flanges. The hub dimensions shall be the same as those of the standard flange of the size to which the reduction is being made.

6.9 Threads for Threaded Flanges

Except as provided in Note (5), Fig. 7, and Note (5), Table 4, threaded flanges shall have an American National Standard taper pipe thread conforming to ASME B1.20.1. The thread shall be concentric with the axis of the flange, and variations in alignment shall not exceed 0.06 in./ft (0.5%).

6.9.1 Class 150 flanges are made without a counterbore. The threads shall be chamfered approximately to the major diameter of the thread at the back of the flange at an angle of approximately 45 deg. with the axis of the thread. The chamfer shall be concentric with the thread and shall be included in the measurement of the thread length.

6.9.2 Class 300 and higher pressure flanges are made with a counterbore at the back of the flange. The threads shall be chamfered to the diameter of the counterbore at an angle of approximately 45 deg. with the axis of the threads. The counterbore and chamfer shall be concentric with the thread.

6.9.3 The minimum length of effective thread in reducing flanges shall be at least equal to dimension *T* of the corresponding class of threaded flange as shown in the tables. Threads do not necessarily extend to the face of the flange. See Table 7 for reducing threaded flanges.

6.9.4 The gaging notch of the working gage shall come flush with the bottom of the chamfer in all threaded flanges and shall be considered as being the intersection of the chamfer cone and the pitch cone of the thread. This depth of chamfer is approximately equal to one-half the pitch of the thread. The maximum allowable thread variation is one turn large or small from the gaging notch.

6.9.5 Annex A indicates the distance and number of turns that external pipe threads may be made longer than regular for use with the higher pressure flanges to bring the small end of the thread close to the face of the flange when the parts are assembled by power equipment. Annex A applies to ASME B1.20.1 and is considered part of this Standard.

6.10 Flange Bolting Dimensions

6.10.1 Dimensional Standards. Stud bolts threaded at both ends or full length, or bolts may be used. Dimensional recommendations for bolts, stud bolts, and nuts are shown in Table 1C. See para. 5.3 for bolting material recommendations.

6.10.2 Bolt Lengths. Stud bolts with a nut at each end are recommended for high temperature service. Stud bolt lengths are specified in Tables 8, 11, 14, 17, 20, 23, and 26, and include the thickness of two nuts. The stud bolt length does not include the height of any point. A point is that part of a stud bolt or a bolt beyond the thread and may be chamfered, rounded, or sheared. For the method of calculating bolt lengths, see Annex F.

These lengths are established for the convenience of industry to simplify the assembly of these parts on construction work, but users may select combinations of these bolt lengths to suit their needs. Hence, Annex F is not considered part of this Standard.

6.10.3 The end flange bolting is based on a stress on the effective tensile stress area of the bolts not to exceed 7.0 ksi, assuming a pressure in psi equal to the pressure rating class designation to act upon an area circumscribed by the outside diameter of the raised face, dimension *R*, Table 4.

6.11 Gaskets for Line Flanges

6.11.1 Ring joint gasket dimensions shall conform to ASME B16.20.

6.11.2 For flanges with raised face, or with large male-and-female face, gaskets shall conform to limiting dimensions of Annex E.

6.11.3 For flanges having large or small tongue-and-groove faces, all gaskets except solid flat metal gaskets shall cover the bottom of the groove, with minimum clearance. (See para. 7.2.1 for tolerance applicable to groove.) Solid flat metal gaskets shall have contact width not greater than for Group No. III gaskets.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:44:52 2005

6.11.4 For flanges with small male-and-female face, care must be taken to insure that adequate bearing surface is provided for the gaskets. This applies particularly where the joint is made on the end of pipe. See Fig. 7.

6.12 Auxiliary Connections

No auxiliary connections, or openings therefore, will be provided except as specified by the purchaser. If assembly is required, the purchaser shall also specify the applicable code or regulation. Welded auxiliary connections shall be made by a qualified welder using a qualified weld procedure.

6.12.1 Pipe Thread Tapping. Holes may be tapped in the wall of a fitting if the metal is thick enough to allow the effective thread length specified in Fig. 3. Where thread length is insufficient or the tapped hole needs reinforcement, a boss shall be added.

6.12.2 Welded Connections

6.12.2.1 Sockets. Sockets (socket welding) may be provided in the wall of a fitting if the metal is thick enough to afford the depth of socket and retaining wall specified in Fig. 4. Where the wall thickness is insufficient, or the size of the connection requires opening reinforcement, a boss shall be added.

6.12.2.2 Butt Weld. Connections may be attached by butt welding directly to the wall of the fitting (see Fig. 5). Where the size of an opening requires reinforcement, a boss shall be added.

6.12.3 Bosses. Where bosses are required, the diameters shall be not less than those shown in Fig. 6, and the height shall provide lengths as specified in Fig. 3 or 4.

6.12.4 Size. Unless otherwise specified, auxiliary connections shall be of the pipe sizes given below.

Fitting Size, NPS	Connection, NPS
2–4	½
5–8	¾
10 and up	1

6.12.5 Designating Locations. This means of designating the locations for auxiliary connections in fittings are shown in Fig. 1.

Each possible location is designated by a letter so that the desired locations for the various types of fittings may be specified without using further sketches or description.

7 TOLERANCES[2]

7.1 General

For the purpose of determining conformance with this Standard, the convention for fixing significant digits where limits, maximum or minimum values are specified, shall be the rounding-off method defined in ASTM Practice E 29. This requires that an observed or calculated value shall be rounded to the nearest unit in the last right hand digit used for expressing the limit.

The listing of decimal tolerances does not imply a particular method of measurement.

7.2 Center-to-Contact Surfaces and Center-to-End

7.2.1 Center-to-Contact Surfaces Other Than Ring Joint (a)

NPS 10 and smaller	0.03 in.
NPS 12 and larger	0.06 in.

7.2.2 Center-to-End (Ring Joint)

NPS 10 and smaller	0.03 in.
NPS 12 and larger	0.06 in.

7.2.3 Contact Surface-to-Contact Surface Other Than Ring Joint

NPS 10 and smaller	0.06 in.
NPS 12 and larger	0.12 in.

7.2.4 End-to-End (Ring Joint)

NPS 10 and smaller	0.06 in.
NPS 12 and larger	0.12 in.

7.3 Facings

7.3.1 Inside and outside diameter of large and small tongue and groove and female, 0.02 in.

7.3.2 Outside diameter, 0.06 in. raised face, 0.03 in.

7.3.3 Outside diameter, 0.25 in. raised face, 0.02 in.

7.3.4 Ring joint groove tolerances are shown in Table 5.

7.4 Flange Thickness

NPS 18 and smaller	+0.12 in., –zero
NPS 20 and larger	+0.19 in., –zero

[2] Unless otherwise stated, tolerances are equal plus and minus.

7.5 Hub Dimensions and Welding Ends

7.5.1 Nominal outside diameter of welding end of welding neck flanges (dimension *A* of Figs. 8 and 9).

NPS 5 and smaller	+0.09 in., −0.03 in.
NPS 6 and larger	+0.16 in., −0.03 in.

7.5.2 Nominal inside diameter of welding ends of welding neck flanges and smaller bore of socket welding flanges (dimension *B* in the referenced figures).

Figs. 8 and 9:

NPS 10 and smaller	0.03 in.
NPS 12 to 18, inclusive	0.06 in.
NPS 20 and larger	+0.12 in., −0.06 in.

Fig. 10:

NPS 10 and smaller	+zero, −0.03 in.
NPS 12 and larger	+zero, −0.06 in.

7.5.3 Bore of backing ring of welding neck flanges (dimension *C* of Figs. 10 and 11).

All sizes	+0.010 in., − zero

7.5.4 Thickness of Hub. Regardless of tolerances specified for dimensions *A* and *B*, the thickness of hub at the welding end shall never be less than 87½% of the nominal thickness of the pipe to which the flange is to be attached.

(a) 7.6 Overall Length Through Hub on Welding Neck Flanges

NPS 4 and smaller	0.06 in.
NPS 5 to 10, inclusive	+0.06 in., −0.12 in.
NPS 12 and larger	+0.12 in., −0.18 in.

7.7 Bore of Flanges

7.7.1 Lapped, Slip-On, and Socket Welding Flanges

NPS 10 and smaller	+0.03 in., −zero
NPS 12 and larger	+0.06 in., −zero

7.7.2 Counterbore, Threaded Flanges

NPS 10 and smaller	+0.03 in., −zero
NPS 12 and larger	+0.06 in., −zero

7.8 Drilling and Facing

7.8.1 Bolt circle diameter, 0.06 in.

7.8.2 Center-to-center of adjacent bolt holes, 0.03 in.

7.8.3 Eccentricity between bolt circle diameter and machined facing diameters.

NPS 2½ and smaller	0.03 in.
NPS 3 and larger	0.06 in.

8 TEST

8.1 Flanged Fitting Testing (a)

Each flanged fitting shall be given a hydrostatic shell test as specified in para. 8.3.

8.2 Flange Testing

Flanges are not required to be hydrostatically tested.

8.3 Hydrostatic Shell Test

The hydrostatic shell test for flanged fittings shall be no less than 1.5 times the 100°F rating rounded off to the next higher 25 psi increment.

8.3.1 The test shall be made with water, which may contain a corrosion inhibitor, with kerosene, or with another suitable fluid provided its viscosity is no greater than that of water, at a test temperature not above 125°F.

8.3.2 The test duration shall be a minimum of 1 min for fittings NPS 2 and smaller, 2 min for fittings NPS 2½–NPS 8, and 3 min for fittings NPS 10 and larger.

8.3.3 No visible leakage is permitted through the pressure boundary wall.

3.17	29Ni–20.5Cr–3.5Cu–2.5Mo	2-3.17		A 351 Gr. CN7M	

GENERAL NOTES:

(a) For temperature limitations, see Notes in Table 2.

(b) Plate materials are listed only for use as blind flanges (see para. 5.1). Additional plate materials listed in ASME B16.34 may also be used with corresponding B16.34 Standard Class ratings.

(c) Material Groups not listed in Table 1A are intended for use in valves. See ASME B16.34.

NOTE:

(1) ASME Boiler and Pressure Vessel Code, Section II materials, which also meet the requirements of the listed ASTM specifications, may also be used.

C-Mn-Si-V	A 350 Gr. LF6 Cl. 1 (4)		

NOTES:
(1) Upon prolonged exposure to temperatures above 800°F, the carbide phase of steel may be converted to graphite. Permissible, but not recommended for prolonged use above 800°F.
(2) Not to be used over 850°F.
(3) Not to be used over 700°F.
(4) Not to be used over 500°F.

TABLE 2-2.2 RATINGS FOR GROUP 2.2 MATERIALS

Nominal Designation	Forgings	Castings	Plates
16Cr–12Ni–2Mo	A 182 Gr. F316 (1) A 182 Gr. F316H	A 351 Gr. CF3M (2) A 351 Gr. CF8M (1)	A 240 Gr. 316 (1) A 240 Gr. 316H
18Cr–13Ni–3Mo			A 240 Gr. 317 (1)
19Cr–10Ni–3Mo		A 351 Gr. CG8M (3)	

NOTES:
(1) At temperatures over 1000°F, use only when the carbon content is 0.04% or higher.
(2) Not to be used over 850°F.
(3) Not to be used over 1000°F.

TABLE 2-2.7 RATINGS FOR GROUP 2.7 MATERIALS (a)

Nominal Designation	Forgings	Castings	Plates
25Cr–20Ni	A 182 Gr. F310 (1)(3)	A 351 Gr. CK20 (1)	A 240 Gr. 310S (1)(2)(3) A 240 Gr. 310H

NOTES:
(1) At temperatures over 1000°F, use only when the carbon content is 0.04% or higher.
(2) For temperatures above 1000°F, use only if the material is heat treated by heating it to a temperature of at least 1900°F and quenching in water or rapidly cooling by other means.
(3) Service temperatures of 1050°F and above should be used only when assurance is provided that grain size is not finer than ASTM 6.

42Ni-21.5Fe-3Cr-2.3Cu	B 564 Gr. N08825 (3)(7)		B 424 Gr. N08825 (3)(7)

NOTES:
(1) Use solution annealed material only.
(2) The chemical composition, mechanical properties, heat treating requirements, and grain size requirements shall conform to the applicable ASTM specification. The manufacturing procedures, tolerances, tests, certification, and markings shall be in accordance with ASTM B 564.
(3) Use annealed material only.
(4) Not to be used over 1250°F.
(5) Not to be used over 1200°F. Alloy N06625 in the annealed condition is subject to severe loss of impact strength at room temperatures after exposure in the range of 1000°F to 1400°F.
(6) Not to be used over 800°F.
(7) Not to be used over 1000°F.

TABLE 13 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 11.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) When these fittings are required with flat face flange, either the full thickness or thickness with raised face removed may be furnished. Users are reminded that removing the raised face will make the center-to-face dimension nonstandard. See para. 6.4.1.1 for additional restrictions.
(10) The thickness of flange dimension illustrated is for regularly furnished 0.06 in. raised face (except lapped); for thickness requirement of other facings, see Fig. 7.
(11) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(12) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(13) These dimensions apply to straight sizes only. See paras. 6.2.3 and 6.4.1.3. For center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-contact surface or contact surface-to-contact surface dimensions of 0.06 in. raised face (flange edge) for largest opening and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(14) The base dimensions apply to all straight and reducing sizes.
(15) For reducing fittings, the size and center-to-face dimension of base are determined by the size of the largest opening of fittings. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(16) Bases shall be plain faced unless otherwise specified, and the center-to-base dimension R shall be the finished dimension.
(17) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(a) (18) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

Date of Issuance: February 28, 1997

The 1996 edition of this Standard is being issued with an automatic addenda subscription service. The use of an addenda allows revisions made in response to public review comments or committee actions to be published as necessary; revisions published in addenda will become effective 6 months after the Date of Issuance of the addenda. The next edition of this Standard is scheduled for publication in 2001.

ASME issues written replies to inquiries concerning interpretations of technical aspects of this Standard. The interpretations will be included with the above addenda service. Interpretations are not part of the addenda to the Standard.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

FOREWORD

(This Foreword is not part of ASME B16.5-1996)

In 1920, the American Engineering Standards Committee [later the American Standards Association (ASA)] organized Sectional Committee B16 to unify and further develop standards for pipe flanges and fittings (and later for valves and gaskets). Cosponsors of the B16 Committee were the American Society of Mechanical Engineers (ASME), the Heating and Piping Contractors National Association [now Mechanical Contractors Association of America (MCAA)], and the Manufacturers Standardization Society of the Valve and Fittings Industry (MSS). Cosponsors were later designated as cosecretariat organizations.

The Committee soon recognized the need for standardization of steel pipe flanges. In May 1923, Subcommittee 3 was organized to develop such standards for pressures in the 250 psi to 3200 psi range and for elevated temperatures. Active work began in October, including steel flanged fittings. The first proposed standard was submitted to the Committee in April 1926 and approved by letter ballot in December. After favorable review by the three sponsor organizations, the Standard was approved as American Tentative Standard B16e in June 1927.

Experience in using the Standard showed the need for hub dimensions of companion flanges and for other changes, including rerating of 250 lb and 1350 lb flanges and development of flanged fittings with integral bases. An investigation was made into the factors determining stiffness of flanges and flange hubs. The revised edition was approved as ASA B16e-1932.

A revision was initiated in 1936, stimulated by suggestions from Committee members and industrial users. The resulting 1939 edition contained standards for welding neck flanges (completed in March 1937), 1500 lb flanges in the 14 in. through 24 in. range, 2500 lb flanges and flanged fittings in the ½ in. through 12 in. range, and dimensions for a full line of ring joint flanges developed by the American Petroleum Institute. Pressure-temperature ratings for alloy steel flanges and fittings, developed by Subcommittee 4, were included for the first time.

In August 1942, the War Production Board requested a review of measures to conserve vital materials in piping components. A special War Committee of B16 was appointed and, operating under War Standards Procedure, developed revised pressure-temperature ratings for all materials and all pressure classes. The ratings were published as American War Standard B16e5-1943. In 1945, under normal procedures, Subcommittees 3 and 4 reviewed the 1939 Standard and the 1943 ratings, and recommended adoption of the wartime ratings. Their report was approved as Supplement No. 1 to B16e-1939 and published as ASA B16e6-1949. In addition to ratings, the supplement updated material specification references and added a table of metal wall thicknesses for welding-end valves.

Subcommittee 3 then began a revision of the entire standard. Technically, the 1949 Supplement was absorbed, new materials were recognized, a general rating method was developed and added as an appendix, and welding end preparations were expanded. Editorially, a new style of presentation was worked out, including tables rearranged for easier use. Approval by Sectional Committee, cosponsors, and ASA resulted in publication of ASA B16.5-1953 (designation changed from B16e).

Wed Feb 02 00:45:00 2005

Work soon began on further revisions. Class B ratings were deleted and Class A ratings were clarified as the standard. An appendix defined qualifications for gaskets, other than ring joint, which would merit the ratings. Another appendix defined the method for calculating bolt lengths (including measurement of the length of stud bolts between thread ends instead of between points). Pressure-temperature ratings for several new materials were added, the table of welding end dimensions was expanded, and the temperature used in determining ratings were redefined. The resulting new edition, after approval, was published as ASA B16.5-1957.

The more modest revision approved as ASA B16.5-1961 changed the text to clarify the intent or to make requirements easier to administer. The next revision began in 1963 with nearly 100 comments and suggestions. No fundamental changes were made, but the text was further clarified and wall thicknesses less than $\frac{1}{4}$ in. for flanged fittings were recognized in the 1968 edition.

A new joint study of ratings between Subcommittees 3 and 4 was initiated before the next revision. Based on Subcommittee 4's report, the rating procedure was revised and a rating basis for Class 150 (150 lb) flanges was developed. New product forms, bar and plate, were added for special applications, including fabricated flanged valves and fittings. Reference to welding-end valves was deleted because a separate standard for them was in preparation. Bolt length calculations based on worst case tolerances led to a revision of tabulated lengths. Testing of valve closure members was added to the test requirements. Following final approval on October 23, the Standard was published as ANSI B16.5-1973.

Subcommittee N was assigned responsibility for all valve standards in late 1973. Subcommittee C (formerly 3) continues to have responsibility for flange standards. A revision was accordingly initiated to remove all references to valves. At the same time, comments from users and changes in the ASME Boiler and Pressure Vessel Code led to significant revisions in the Class 150 rating basis, and in the ratings of stainless steel and certain alloy steel flanges and flanged fittings in all rating classes. Extensive public review comments led to addition of considerations for flanged joints, for bolting and gaskets, and of marking requirements. To avoid frequent and confusing changes in ratings as further changes in Code allowable stresses are made, it was agreed with Subcommittee N to leave ratings alone unless the relevant Code stress values are changed by more than 10%. After final approval by Standards Committee, cosponsors, and ANSI, ANSI B16.5-1977 Steel Pipe Flanges and Flanged Fittings, was published on June 16, 1977.

In 1979, work began on another new edition. Materials coverage was expanded by the addition of nickel and nickel alloys. Bolting rules were revised to cover nickel alloy bolts. Bolt hole and bolting were changed to provide interchangeability between inch and metric dimensions. Metric dimensional tables were made informational rather than alternative requirements of the Standard. Final approval was granted for ANSI B16.5-1981, Pipe Flanges and Flanged Fittings on August 14.

In 1982, American National Standards Committee B16 was reorganized as an ASME Committee operating under procedures accredited by ANSI. The 1988 edition of the Standard extended nickel alloy ratings to higher temperatures, clarified flat face flange requirements, and included other minor revisions. The Committee determined that any metric standard for flanges will stand alone, with metric bolting and gaskets; hence metric equivalents have been deleted. Following approval by the Standards Committee and ASME, approval as American National Standard was given by ANSI on April 7, 1988, with the new designation ASME/ANSI B16.5-1988.

This 1996 Edition allows flanges marked with more than one material grade or specification, revises flange facing finish requirements, has revised pressure–temperature ratings for several material groups, adds a nonmandatory quality system annex, and includes several other

Copyright by the American Society Of Mechanical Engineers

revisions. Following approval by the Standards Committee and ASME, approval as an American National Standard was given by ANSI on October 3, 1996 with the new designation ASME B16.5-1996.

Requests for interpretations or suggestions for revision should be sent to the Secretary, B16 Committee, The American Society of Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, NY 10017.

PIPE FLANGES AND FLANGED FITTINGS

1 SCOPE

1.1 General

This Standard covers pressure–temperature ratings, materials, dimensions, tolerances, marking, testing, and methods of designating openings for pipe flanges and flanged fittings in sizes NPS ½ through NPS 24 and in rating Classes 150, 300, 400, 600, 900, 1500, and 2500. Flanges and flanged fittings may be cast, forged, or (for blind flanges and certain reducing flanges only) plate materials as listed in Table 1A.

Requirements and recommendations regarding bolting and gaskets are also included.

1.2 References

1.2.1 Referenced Standards. Standards and specifications adopted by reference in this Standard are shown in Annex G, which is part of this Standard. It is not considered practical to identify the specific edition of each standard and specification in the individual references. Instead, the specific edition reference is identified in Annex G. A flange or flanged fitting manufactured in accordance with earlier editions of the referenced standards and in all other respects conforming to this Standard will be considered to be in conformance with this Standard.

1.2.2 Codes and Regulations. A flange or flanged fitting used under the jurisdiction of the ASME Boiler and Pressure Vessel Code, the ASME Code for Pressure Piping, or a governmental regulation is subject to any limitation of that code or regulation. This includes any maximum temperature limitation, or rule governing the use of a material at low temperature, or provisions for operation at a pressure exceeding the pressure–temperature ratings in this Standard.

1.3 Applicable Ratings

The pressure–temperature ratings in this Standard are applicable upon its publication to all flanges and flanged fittings within its scope which otherwise meet its requirements. For unused flanges or flanged fittings maintained in inventory, the manufacturer of the flange or flanged fittings may certify conformance to this Edition provided he can demonstrate that all requirements of this Edition have been met. Where such components were installed in accordance with the pressure–temperature ratings of an earlier edition of this Standard, those ratings are applicable except as may be governed by the applicable code or regulation (see para. 1.2.2).

1.4 User Accountability

This Standard cites duties and responsibilities that are to be assumed by the user in the areas of application, installation, hydrostatic testing, operation, and material selection.

1.5 Quality Systems

Nonmandatory requirements relating to the product manufacturer's Quality System Program are described in Annex G.

2 PRESSURE–TEMPERATURE RATINGS

2.1 Ratings Basis

Ratings are maximum allowable working gage pressures at the temperatures shown in Table 2 for the applicable material and rating. For intermediate temperatures, linear interpolation is permitted. See Annex D, which is part of this Standard, for methods of establishing pressure–temperature ratings.

2.2 Ratings of Flanged Joints

A flanged joint is composed of three separate and independent, although interrelated components: the flanges, the gasket, and the bolting, which are assembled by yet another influence, the assembler. Proper controls must be exercised in the selection and application for all these elements to attain a joint which has acceptable leak tightness. Special techniques, such as controlled bolt tightening, may be necessary to achieve a tight joint in service.

Ratings in this Standard apply to flanged joints which conform to the limitations on bolting in para. 5.3 and on gaskets in para. 5.4, and which are made up in accordance with good practice for alignment and assembly. See also para. 2.4. Use of the ratings for flanged joints not conforming to these limitations is the responsi-

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:02 2005

bility of the user. Requirements for alignment and assembly of joints are not given in this Standard.

If the two flanges in a flanged joint do not have the same pressure–temperature ratings, the rating of the joint at any temperature is the lower of the two flange ratings at that temperature.

2.3 Rating Temperature

The temperature shown for a corresponding pressure rating is the temperature of the pressure-containing shell of the flange or flanged fitting. In general, this temperature is the same as that of the contained fluid. Use of a pressure rating corresponding to a temperature other than that of the contained fluid is the responsibility of the user, subject to the requirements of the applicable code or regulation. For any temperature below −20°F, the rating shall be no greater than the rating shown for −20°F.

2.4 Temperature Considerations

Application of the ratings in this Standard to flanged joints at both high and low temperatures shall take into consideration the risk of leakage due to forces and moments developed in the connected piping or equipment. The following provisions are intended to minimize these risks.

2.4.1 Flange Attachment. Socket welding and threaded flanges are not recommended for service above 500°F or below −50°F if severe thermal gradients or thermal cycling are involved.

2.4.2 High Temperature Service. At temperatures in the creep range, gradual relaxation of flanges, bolts, and gaskets may progressively reduce bolt loads. It may be necessary to arrange for periodic tightening of bolts to prevent leakage. Joints subject to substantial thermal gradients may require the same attention.

When used above 400°F, Class 150 flanged joints may develop leakage unless care is taken to avoid imposing severe external loads and/or severe thermal gradients. For other classes, similar consideration should be given above 750°F.

2.4.3 Low Temperature Service. The user should recognize that some of the material listed in the rating tables undergo sufficient decrease in toughness at low temperatures that they cannot safely sustain shock loadings, sudden changes of stress or temperature, or high stress concentrations.

2.5 System Hydrostatic Test

Flanged joints and flanged fittings may be subjected to system hydrostatic tests at a pressure not to exceed 1.5 times the 100°F rating rounded off to the next higher 25 psi. Testing at any higher pressure is the responsibility of the user, subject to the requirements of the applicable code or regulation.

2.6 Welding Neck Flanges

Ratings for welding neck flanges covered by this Standard are based upon their hubs at the welding end having thickness at least equal to that calculated for pipe having 40.0 ksi specified minimum yield strength. (For higher strength pipe with thinner wall, see MSS SP-44.) The ratings also apply to such flanges used with components of unequal strength and unequal wall thickness when the attachment weld is made in accordance with the applicable code or regulation. See Figs. 12, 13, and 14.

2.7 Multiple Material Grades

Materials for flanges and flanged fittings may meet the requirements for more than one specification or grade of a specification listed in Table 1A. In that event, the pressure–temperature ratings for any of these specifications or grades may be used provided that marking is in accordance with para. 4.1.2(d).

3 SIZE

3.1 Nominal Size

The size of a flange or flanged fitting covered by this Standard is its nominal pipe size, NPS. The diameter of a bolt is its nominal size. Use of "nominal" indicates that the stated size or dimension is only for designation, not measurement. The actual dimension may or may not be the nominal size and is subject to established tolerances.

3.2 Reducing Fittings

Reducing fittings shall be designated by the size of the openings in their proper sequence as indicated in the sketches of Fig. 2.

3.3 Reducing Flanges

Reducing flanges shall be designated by the two nominal pipe sizes. See examples in Note (4) of Table 7.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:02 2005

4 MARKING

4.1 General

Except as modified herein, flanges and flanged fittings shall be marked as required in MSS SP-25.

4.1.1 Name. The manufacturer's name or trademark shall be applied.

4.1.2 Material

(a) Cast flanges and flanged fittings shall be marked with the ASTM specification,[1] grade identification symbol, and the melt number or melt identification.

(b) Plate flanges, forged flanges, and flanged fittings shall be marked with the ASTM specification number[1] and grade identification symbol.

(c) A manufacturer may supplement these mandatory material indications with his trade designation for the material grade, but confusion of symbols shall be avoided.

(d) Flanges and flanged fittings manufactured from material which meets the requirements for more than one specification or grade of a specification listed in Table 1A may be marked with more than one of the applicable specification or grade symbols. The symbols shall be placed to avoid confusion in identification.

4.1.3 Rating Class. The marking shall be the applicable pressure rating class: 150, 300, 400, 600, 900, 1500, or 2500.

4.1.4 Designation. The designation B16 shall be applied, preferably located adjacent to the class designation, to indicate conformance to this Standard.

4.1.5 Temperature. No temperature markings are required on flanges and flanged fittings, but if marked, the temperature shall be shown with its corresponding tabulated pressure rating for the material.

4.1.6 Size. The nominal pipe size shall be given, but may be omitted from reducing flanges and reducing flanged fittings.

4.1.7 Ring Joint Flange. The edge (periphery) of each ring joint flange shall be marked with the letter R and the corresponding ring groove number.

[1] The ASME Boiler and Pressure Vessel Code, Section II specification number may be substituted provided the material is covered by Section II.

5 MATERIALS

5.1 General

Flanges and flanged fittings covered by this Standard shall be castings, forgings, and (for blind flanges only) plate as listed in Table 1A. Recommended bolting materials are listed in Table 1B. (See also para. 5.3.) ASME Boiler and Pressure Vessel Code, Section II materials, which also meet the requirements of the specifications listed in Tables 1A, 1B, and 1C, may also be used.

5.1.1 Application. Criteria for the selection of materials are not within the scope of this Standard. The possibility of material deterioration in service should be considered by the user. Carbide phase conversion to graphite and excessive oxidation of ferritic materials, susceptibility to intergranular corrosion of austenitic materials, or grain boundary attack of nickel base alloys are among those items requiring attention. A detailed discussion of precautionary considerations can be found in Appendix F of ASME/ANSI B31.3.

5.1.2 Toughness. Some of the materials listed in Table 1A undergo a decrease in toughness when used at low temperatures, to the extent that Codes referencing this Standard may require impact tests for application even at temperatures higher than +20°F. It is the responsibility of the user to assure that such testing is performed.

5.1.3 Responsibility. When service conditions dictate the implementation of special material requirements, e.g., using a Group 2 material above 1000°F, it is the users responsibility to so specify to the manufacturer in order to ensure compliance with metallurgical requirements listed in the notes in Table 2.

5.2 Mechanical Properties

Mechanical properties shall be obtained from test specimens that represent the final heat treated condition of the material required by the material specification.

5.3 Bolting

Bolting listed in Table 1B is recommended for use in flanged joints covered by this Standard. Bolting of other material may be used if permitted by the applicable code or government regulation. All bolting materials are subject to the following limitations.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:03 2005

5.3.1 High Strength Bolting. Bolting materials having allowable stresses not less than those for ASTM A 193 Grade B7 are listed as high strength in Table 1B. These and other materials of comparable strength may be used in any flanged joint.

5.3.2 Intermediate Strength Bolting. Bolting materials listed as intermediate strength in Table 1B, and other bolting of comparable strength, may be used in any flanged joint, provided the user verifies their ability to seat the selected gasket and maintain a sealed joint under expected operating conditions.

5.3.3 Low Strength Bolting. Bolting materials having not more than 30 ksi specified minimum yield strength are listed as low strength in Table 1B. These materials and others of comparable strength shall be used only in Classes 150 and 300 joints, and only with gaskets described in para. 5.4.1. Flanged joints using low strength carbon steel bolts shall not be used above 400°F or below −20°F.

5.3.4 Bolting to Gray Cast Iron Flanges. The following recommendations are made in recognition of the low ductility of gray cast iron.

(a) Alignment of flange faces is essential along with control of assembly bolt torque so as not to over-stress the cast iron flanges. Care must also be exercised to ensure that piping loads transmitted to cast iron flanges are controlled, taking into account its lack of ductility and recognizing that cast iron flanges should not be used where suddenly applied loads such as rapid pressure fluctuation may occur.

(b) Where Class 150 steel flanges are bolted to Class 125 cast iron flanges, the gaskets should be made of Group No. Ia materials, the steel flanges should have flat faces, and:

(1) low strength bolting within the limitations of para. 5.3.3 should be used with ring gaskets extending to the bolt holes; or

(2) bolting of low (para. 5.3.3), intermediate (para. 5.3.2), or high (para. 5.3.1) strength may be used with full face gaskets extending to the outside diameters of the flanges.

(c) Where Class 300 steel flanges are bolted to Class 250 cast iron flanges, the gaskets should be made of Group No. Ia materials, and:

(1) low strength bolting within the limitations of para. 5.3.3 should be used with gaskets extending to the bolt holes and with the flanges having either raised or flat faces; or

(2) bolting of low (para. 5.3.3), intermediate (para. 5.3.2), or high (para. 5.3.1) strength may be used with full face gaskets extending to the outside diameters of the flanges and with both the Class 300 steel and Class 250 cast iron flanges having flat faces.

5.4 Gaskets

Ring joint gasket materials shall conform to ASME B16.20. Materials for other gaskets are described in Annex E, which is part of this Standard. The user is responsible for selection of gasket materials which will withstand the expected bolt loading without injurious crushing, and which are suitable for the service conditions. Particular attention should be given to gasket selection if a system hydrostatic test approaches or exceeds the test pressure specified in para. 2.5.

5.4.1 Gaskets for Low Strength Bolting. If bolting listed as low strength in Table 1B is used, gaskets shown in Fig. E1, Group No. Ia, shall be used.

5.4.2 Gaskets for Class 150 Flanged Joints. It is recommended that only Fig. E1, Group No. I, gaskets be used for Class 150 flanged joints. When the ring joint or spiral wound gasket is selected, it is recommended that line flanges be of the welding neck or lapped joint type.

6 DIMENSIONS

6.1 Wall Thickness

For inspection purposes the minimum wall thickness t_m of flanged fittings at the time of manufacture shall be as shown in Tables 10, 13, 16, 19, 22, 25, and 28, except as provided in para. 6.1.1. See Annex D for the basis used to establish values of t_m.

Additional metal thickness needed to withstand assembly stresses, shapes other than circular, and stress concentrations must be determined by the manufacturer, since these factors vary widely. In particular, 45 deg. laterals, true Y's, and crosses may require additional reinforcement to compensate for inherent weaknesses in these shapes.

6.1.1 Local Areas. Local areas having less than minimum wall thickness will be acceptable provided that:

(a) the area of subminimum thickness can be enclosed by a circle whose diameter is no greater than $0.35\sqrt{dt_m}$ where d is the inside diameter as defined above and t_m is the minimum wall thickness as shown in the tables listed in para. 6.1; and

(b) measured thickness is not less than $0.75\ t_m$; and,

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:03 2005

(c) enclosure circles are separated from each other by an edge-to-edge distance of more than $1.75\sqrt{dt_m}$.

6.2 Center-to-Center Surface and Center-to-End

6.2.1 Design. A principle of design in this Standard is to maintain a fixed position for the flange edge with reference to the body of the fitting. The addition of any facing is beyond the outside edge of the flange except for the 0.06 in. raised face in the Classes 150 and 300 Standards. (See para. 6.4.)

6.2.2 Standard Fittings. Center-to-contact surface, center-to-flange edge, and center-to-end (ring joint) dimensions are shown in Tables 10, 13, 16, 19, 22, 25, and 28.

6.2.3 Reducing Fittings. Center-to-contact surface or center-to-flange edge dimensions for all openings shall be the same as those of straight size fittings of the largest opening. The contact surface-to-contact surface or flange edge-to-flange edge dimensions for all combinations of reducers and eccentric reducers shall be as listed for the larger opening.

6.2.4 Side Outlet Fittings. Side outlet elbows, side outlet tees, and side outlet crosses shall have all openings on intersecting center lines, and the center-to-contact surface dimensions of the side outlet shall be the same as for the largest opening. Long radius elbows with side outlet shall have the side outlet on the radial center line of the elbow, and the center-to-contact surface dimension of the side outlet shall be the same as for the regular 90 deg. elbow of the largest opening.

6.2.5 Special Degree Elbows. Special degree elbows ranging from 1 deg. to 45 deg., inclusive, shall have the same center-to-contact surface dimensions as 45 deg. elbows and those over 45 deg. and up to 90 deg., inclusive, shall have the same center-to-contact surface dimensions as 90 deg. elbows. The angle designation of an elbow is its deflection from straight line flow and is also the angle between the flange faces.

6.3 Flat Face Flanges

This Standard permits flat face flanges in all classes, by providing flanges having either the full thickness or the thickness with the raised face removed, without reduction of the pressure–temperature ratings subject to the following provisions.

6.3.1 The thickness of a Class 150 or 300 flange from which the raised face has been removed shall be no less than the applicable dimension *C* of Tables 9, 10, 12, and 13 minus 0.06 in.

6.3.2 The thickness of a flange of Class 400 or higher from which the raised face has been removed shall be no less than the applicable dimension *C* of Tables 15, 16, 18, 19, 21, 22, 24, 25, 27, and 28.

6.3.3 A gasket of Group No. Ia material (see Fig. E1) is recommended for all joints having two flat faced flanges using a gasket which has a larger diameter than the raised face shown in Table 4.

6.3.4 The flange facing shall conform with para. 6.4.4 for the full width of seating of the gasket.

6.4 Facings

6.4.1 For Other Than Lapped Joints. Table 4 gives dimensions for facings other than ring joint. Table 5 gives dimensions for ring joint facings. Figure 7 shows application of facings. Classes 150 and 300 fittings and companion flanges are regularly furnished with a 0.06 in. raised face which is included in the minimum flange thickness *C*. Classes 400, 600, 900, 1500, and 2500 fittings and companion flanges are regularly furnished with 0.25 in. raised face which is additional to the minimum flange thickness *C*. Any other facing than the above, when required for any class, shall be furnished as follows.

6.4.1.1 No metal shall be cut from the minimum flange thickness specified herein except as permitted in para. 6.3.

6.4.1.2 In the case of the 0.25 in. raised face, tongue or male face (other than 0.06 in. raised face for Classes 150 and 300), the minimum flange thickness *C* shall be first provided and then the raised face, tongue or male face shall be added thereto.

6.4.1.3 With ring joint, groove, or female face, the minimum flange thickness shall be first provided and then sufficient metal added thereto so that the bottom of the ring joint groove, or the contact face of the groove or female face is in the same plane as the flange edge of a full thickness flange.

6.4.2 For Lapped Joints. Facings shall be furnished as follows.

6.4.2.1 Raised Face. Finished height of face shall be no less than nominal pipe wall thickness.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:03 2005

6.4.2.2 Large Male and Female. Finished height of a male face shall be no less than wall thickness of pipe used or 0.25 in., whichever is greater. Thickness of lap remaining after matching the female face shall be no less than the nominal wall thickness of pipe used.

6.4.2.3 Tongue and Groove. Thickness of lap remaining after matching tongue or groove face shall be no less than the nominal wall thickness of the pipe used.

6.4.2.4 Ring Joint. Thickness of lap remaining after machining the ring groove shall be no less than the nominal wall thickness of pipe used.

6.4.2.5 The outside diameters of laps for ring joints are shown in Table 5, dimension *K*. The outside diameters of laps for large female, large tongue and groove, and small tongue and groove are shown in Table 4. Small male and female facings are not used with lapped joints.

6.4.3 Blind flanges need not be faced in the center if, when this center part is raised, its diameter is at least 1 in. smaller than the inside diameter of fittings of the corresponding pressure class, as given in the tables. When the center part is depressed, its diameter shall not be greater than the inside diameter of the corresponding pressure class fittings, as given in the tables. Machining of the depressed center is not required.

6.4.4 Flange Facing Finish. The finish of contact faces of pipe flanges and connecting end flanges of fittings shall be judged by visual comparison with Ra standards (see ASME B46.1) and not by instruments having stylus tracers and electronic amplification. The finishes required are given below. Other finishes may be furnished by agreement between user and manufacturer.

6.4.4.1 Tongue and Groove and Small Male and Female. The gasket contact surface shall not exceed 125 μin. roughness.

6.4.4.2 Ring Joint. The side wall surface of gasket groove shall not exceed 63 μin. roughness.

6.4.4.3 Other Flange Facings. Either a serrated concentric or serrated spiral finish having a resultant surface finish from 125 μin. to 250 μin. average roughness shall be furnished. The cutting tool employed should have an approximate 0.06 in. or larger radius, and there should be from 45 grooves/in. through 55 grooves/in.

6.4.5 Flange Facing Finish Imperfections. Imperfections in the flange facing finish shall not exceed the dimensions shown in Table 3. Adjacent imperfections shall be separated by a distance of at least four times the maximum radial projection. A radial projection shall be measured by the difference between an outer radius and an inner radius encompassing the imperfection where the radii are struck from the centerline of the bore. Imperfections less than half the depth of the serrations shall not be considered cause for rejection. Protrusions above the serrations are not permitted.

6.5 Flange Bolt Holes

Bolt holes are in multiples of four. Bolt holes shall be equally spaced and pairs of bolt holes shall straddle fitting center lines.

6.6 Spot Facing

All cast and forged flanges and flanged fittings shall have bearing surfaces for bolting which shall be parallel to the flange face from within 1 deg. Any back facing or spot facing required to accomplish parallelism shall not reduce the flange thickness *C* below the dimensions given in Tables 9, 10, 12, 13, 15, 16, 18, 19, 21, 22, 24, 25, 27, and 28. Any spot facing or back facing shall be in accordance with MSS SP-9.

6.7 Welding End Preparation for Welding Neck Flanges

6.7.1 Welding ends are shown in Figs. 8 through 14.

6.7.2 The contours of the outside of the welding neck beyond the welding groove are shown in Figs. 8, 9, 12, and 14.

6.7.3 Straight through bores shown in Figs. 8 and 9 are standard unless otherwise specifically order to suit the special conditions illustrated in Figs. 10, 11, 13, and 14.

6.7.4 Other welding end preparations furnished by agreement of purchaser and manufacturer do not invalidate compliance with this Standard.

6.8 Reducing Flanges

6.8.1 Drilling, Outside Diameter, Thickness, and Facing Dimensions. Flange drilling, outside diameter, thickness, and facing are the same as those of the standard flange of the size from which the reduction is being made.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:04 2005

6.8.2 Hub Dimensions

6.8.2.1 Threaded, Socketweld, and Slip-On Flanges. The hub dimensions shall be at least as large as those of the standard flange of the size to which the reduction is being made. The hub may be larger or omitted as detailed in Table 7.

6.8.2.2 Welding Neck Flanges. The hub dimensions shall be the same as those of the standard flange of the size to which the reduction is being made.

6.9 Threads for Threaded Flanges

Except as provided in Note (5), Fig. 7, and Note (5), Table 4, threaded flanges shall have an American National Standard taper pipe thread conforming to ASME B1.20.1. The thread shall be concentric with the axis of the flange, and variations in alignment shall not exceed 0.06 in./ft (0.5%).

6.9.1 Class 150 flanges are made without a counterbore. The threads shall be chamfered approximately to the major diameter of the thread at the back of the flange at an angle of approximately 45 deg. with the axis of the thread. The chamfer shall be concentric with the thread and shall be included in the measurement of the thread length.

6.9.2 Class 300 and higher pressure flanges are made with a counterbore at the back of the flange. The threads shall be chamfered to the diameter of the counterbore at an angle of approximately 45 deg. with the axis of the threads. The counterbore and chamfer shall be concentric with the thread.

6.9.3 The minimum length of effective thread in reducing flanges shall be at least equal to dimension *T* of the corresponding class of threaded flange as shown in the tables. Threads do not necessarily extend to the face of the flange. See Table 7 for reducing threaded flanges.

6.9.4 The gaging notch of the working gage shall come flush with the bottom of the chamfer in all threaded flanges and shall be considered as being the intersection of the chamfer cone and the pitch cone of the thread. This depth of chamfer is approximately equal to one-half the pitch of the thread. The maximum allowable thread variation is one turn large or small from the gaging notch.

6.9.5 Annex A indicates the distance and number of turns that external pipe threads may be made longer than regular for use with the higher pressure flanges to bring the small end of the thread close to the face of the flange when the parts are assembled by power equipment. Annex A applies to ASME B1.20.1 and is considered part of this Standard.

6.10 Flange Bolting Dimensions

6.10.1 Dimensional Standards. Stud bolts threaded at both ends or full length, or bolts may be used. Dimensional recommendations for bolts, stud bolts, and nuts are shown in Table 1C. See para. 5.3 for bolting material recommendations.

6.10.2 Bolt Lengths. Stud bolts with a nut at each end are recommended for high temperature service. Stud bolt lengths are specified in Tables 8, 11, 14, 17, 20, 23, and 26, and include the thickness of two nuts. The stud bolt length does not include the height of any point. A point is that part of a stud bolt or a bolt beyond the thread and may be chamfered, rounded, or sheared. For the method of calculating bolt lengths, see Annex F.

These lengths are established for the convenience of industry to simplify the assembly of these parts on construction work, but users may select combinations of these bolt lengths to suit their needs. Hence, Annex F is not considered part of this Standard.

6.10.3 The end flange bolting is based on a stress on the effective tensile stress area of the bolts not to exceed 7.0 ksi, assuming a pressure in psi equal to the pressure rating class designation to act upon an area circumscribed by the outside diameter of the raised face, dimension *R*, Table 4.

6.11 Gaskets for Line Flanges

6.11.1 Ring joint gasket dimensions shall conform to ASME B16.20.

6.11.2 For flanges with raised face, or with large male-and-female face, gaskets shall conform to limiting dimensions of Annex E.

6.11.3 For flanges having large or small tongue-and-groove faces, all gaskets except solid flat metal gaskets shall cover the bottom of the groove, with minimum clearance. (See para. 7.2.1 for tolerance applicable to groove.) Solid flat metal gaskets shall have contact width not greater than for Group No. III gaskets.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:04 2005

6.11.4 For flanges with small male-and-female face, care must be taken to insure that adequate bearing surface is provided for the gaskets. This applies particularly where the joint is made on the end of pipe. See Fig. 7.

6.12 Auxiliary Connections

No auxiliary connections, or openings therefore, will be provided except as specified by the purchaser. If assembly is required, the purchaser shall also specify the applicable code or regulation. Welded auxiliary connections shall be made by a qualified welder using a qualified weld procedure.

6.12.1 Pipe Thread Tapping. Holes may be tapped in the wall of a fitting if the metal is thick enough to allow the effective thread length specified in Fig. 3. Where thread length is insufficient or the tapped hole needs reinforcement, a boss shall be added.

6.12.2 Welded Connections

6.12.2.1 Sockets. Sockets (socket welding) may be provided in the wall of a fitting if the metal is thick enough to afford the depth of socket and retaining wall specified in Fig. 4. Where the wall thickness is insufficient, or the size of the connection requires opening reinforcement, a boss shall be added.

6.12.2.2 Butt Weld. Connections may be attached by butt welding directly to the wall of the fitting (see Fig. 5). Where the size of an opening requires reinforcement, a boss shall be added.

6.12.3 Bosses. Where bosses are required, the diameters shall be not less than those shown in Fig. 6, and the height shall provide lengths as specified in Fig. 3 or 4.

6.12.4 Size. Unless otherwise specified, auxiliary connections shall be of the pipe sizes given below.

Fitting Size, NPS	Connection, NPS
2–4	½
5–8	¾
10 and up	1

6.12.5 Designating Locations. This means of designating the locations for auxiliary connections in fittings are shown in Fig. 1.

Each possible location is designated by a letter so that the desired locations for the various types of fittings may be specified without using further sketches or description.

7 TOLERANCES[2]

7.1 General

For the purpose of determining conformance with this Standard, the convention for fixing significant digits where limits, maximum or minimum values are specified, shall be the rounding-off method defined in ASTM Practice E 29. This requires that an observed or calculated value shall be rounded to the nearest unit in the last right hand digit used for expressing the limit.

The listing of decimal tolerances does not imply a particular method of measurement.

7.2 Center-to-Contact Surfaces and Center-to-End

7.2.1 Center-to-Contact Surfaces Other Than Ring Joint

PS 10 and smaller	0.03 in.
NPS 12 and larger	0.06 in.

7.2.2 Center-to-End (Ring Joint)

NPS 10 and smaller	0.03 in.
NPS 12 and larger	0.06 in.

7.2.3 Contact Surface-to-Contact Surface Other Than Ring Joint

NPS 10 and smaller	0.06 in.
NPS 12 and larger	0.12 in.

7.2.4 End-to-End (Ring Joint)

NPS 10 and smaller	0.06 in.
NPS 12 and larger	0.12 in.

7.3 Facings

7.3.1 Inside and outside diameter of large and small tongue and groove and female, 0.02 in.

7.3.2 Outside diameter, 0.06 in. raised face, 0.03 in.

7.3.3 Outside diameter, 0.25 in. raised face, 0.02 in.

7.3.4 Ring joint groove tolerances are shown in Table 5.

7.4 Flange Thickness

NPS 18 and smaller	+0.12 in., –zero
NPS 20 and larger	+0.19 in., –zero

[2] Unless otherwise stated, tolerances are equal plus and minus.

7.5 Hub Dimensions and Welding Ends

7.5.1 Nominal outside diameter of welding end of welding neck flanges (dimension *A* of Figs. 8 and 9).

NPS 5 and smaller	+0.09 in., −0.03 in.
NPS 6 and larger	+0.16 in., −0.03 in.

7.5.2 Nominal inside diameter of welding ends of welding neck flanges and smaller bore of socket welding flanges (dimension *B* in the referenced figures).

Figs. 8 and 9:

NPS 10 and smaller	0.03 in.
NPS 12 to 18, inclusive	0.06 in.
NPS 20 and larger	+0.12 in., −0.06 in.

Fig. 10:

NPS 10 and smaller	+zero, −0.03 in.
NPS 12 and larger	+zero, −0.06 in.

7.5.3 Bore of backing ring of welding neck flanges (dimension *C* of Figs. 10 and 11).

All sizes	+0.010 in., − zero

7.5.4 Thickness of Hub. Regardless of tolerances specified for dimensions *A* and *B*, the thickness of hub at the welding end shall never be less than 87½% of the nominal thickness of the pipe to which the flange is to be attached.

7.6 Overall Length Through Hub on Welding Neck Flanges

NPS 4 and smaller	+0.06
NPS 5 to 10, inclusive	+0.06, −0.12
NPS 12 and larger	+0.12, −0.18

7.7 Bore of Flanges

7.7.1 Lapped, Slip-On, and Socket Welding Flanges

NPS 10 and smaller	+0.03 in., −zero
NPS 12 and larger	+0.06 in., −zero

7.7.2 Counterbore, Threaded Flanges

NPS 10 and smaller	+0.03 in., −zero
NPS 12 and larger	+0.06 in., −zero

7.8 Drilling and Facing

7.8.1 Bolt circle diameter, 0.06 in.

7.8.2 Center-to-center of adjacent bolt holes, 0.03 in.

7.8.3 Eccentricity between bolt circle diameter and machined facing diameters.

NPS 2½ and smaller	0.03 in.
NPS 3 and larger	0.06 in.

8 TEST

8.1 Flanged Fitting Training

Each flanged fitting shall be given a hydrostatic shell test as specified in para. 8.3.

8.2 Flange Testing

Flanges are not required to be hydrostatically tested.

8.3 Hydrostatic Shell Test

The hydrostatic shell test for flanged fittings shall be no less than 1.5 times the 100°F rating rounded off to the next higher 25 psi increment.

8.3.1 The test shall be made with water, which may contain a corrosion inhibitor, with kerosene, or with another suitable fluid provided its viscosity is no greater than that of water, at a test temperature not above 125°F.

8.3.2 The test duration shall be a minimum of 1 min for fittings NPS 2 and smaller, 2 min for fittings NPS 2½–NPS 8, and 3 min for fittings NPS 10 and larger.

8.3.3 No visible leakage is permitted through the pressure boundary wall.

			A 453	651	(14)						
			A 453	660	(14)						

GENERAL NOTE: Bolting material shall not be used beyond temperature limits specified in the governing code.

NOTES:
(1) Repair welding of bolting material is prohibited.
(2) These bolting materials may be used with all listed materials and gaskets.
(3) These bolting materials may be used with all listed materials and gaskets, provided it has been varified that a sealed joint can be maintained under rated working pressure and temperature.
(4) These bolting materials may be used with all listed materials but are limited to Classes 150 and 300 joints. See para. 5.4.1 for required gasket practices.
(5) These materials may be used as bolting with comparable nickel and special alloy parts.
(6) This austenitic stainless material has been carbide solution treated but not strain hardened. Use A 194 nuts of corresponding material.
(7) Nuts may be machined from the same material or may be of a compatible grade of ASTM A 194.
(8) Maximum operating temperature is arbitrarily set at 500°F, unless material has been annealed, solution annealed, or hot finished because hard temper adversely affects design stress in the creep rupture range.
(9) Forging quality not permitted unless the producer last heating or working these parts tests them as required for other permitted conditions in the same specification and certifies their final tensile, yield, and elongation properties to equal or exceed the requirements for one of the other permitted conditions.
(10) This ferritic material is intended for low temperature service. Use A 194 Grade 4 or Grade 7 nuts.
(11) This austenitic stainless material has been carbide solution treated and strain hardened. Use A 194 nuts of corresponding material.
(12) This carbon steel fastener shall not be used above 400°F or below −20°F. See also Note (4). Bolts with drilled or undersized heads shall not be used.
(13) Acceptable nuts for use with quenched and tempered bolts are A 194 Grades 2 and 2H. Mechanical property requirements for studs shall be the same as those for bolts.
(14) This special alloy is intended for high temperature service with austenitic stainless steel.
(15) ASME Boiler and Pressure Vessel Code, Section II materials, which also meet the requirements of the listed ASTM specifications, may also be used.

TABLE 2-1.4 RATINGS FOR GROUP 1.4 MATERIALS

Nominal Designation	Forgings	Castings	Plates
C–Si			A 515 Gr. 60 (1)
C–Mn–Si	A 350 Gr. LF1, Cl. 1 (1)		A 516 Gr. 60 (1)(2)

NOTES:
(1) Upon prolonged exposure to temperatures above 800°F, the carbide phase of steel may be converted to graphite. Permissible, but not recommended for prolonged use above 800°F.
(2) Not to be used over 850°F.

TABLE 2-1.5 RATINGS FOR GROUP 1.5 MATERIALS

Nominal Designation	Forgings	Castings	Plates
C-½Mo	A 182 Gr. F1 (1)	A 217 Gr. WC1 (1)(2) A 352 Gr. LC1 (3)	A 204 Gr. A (1) A 204 Gr. B (1)

NOTES:
(1) Upon prolonged exposure to temperatures above 875°F, the carbide phase of Carbon-molybdenum steel may be converted to graphite. Permissible, but not recommended for prolonged use above 875°F.
(2) Use normalized and tempered material only.
(3) Not to be used over 650°F.

TABLE 2-2.6 RATINGS FOR GROUP 2.6 MATERIALS

Nominal Designation	Forgings	Castings	Plates
23Cr–12Ni			A 240 Gr. 309S (1)(2)(3) A 240 Gr. 309H
25Cr–12Ni		A 351 Gr. CH8 (1) A 351 Gr. CH20 (1)	

NOTES:
(1) At temperatures over 1000°F, use only when the carbon content is 0.04% or higher.
(2) For temperatures above 1000°F, use only if the material solution is heat treated to the minimum temperature specified in the specification but not lower than 1900°F, and quenching in water or rapidly cooling by other means.
(3) This material should be used for service temperatures 1050°F and above only when assurance is provided that grain size is not finer than ASTM 6.

TABLE 2-3.4 RATINGS FOR GROUP 3.4 MATERIALS

Nominal Designation	Forgings	Castings	Plates
67Ni–30Cu	B 564 Gr. N04400 (1)		B 127 Gr. N04400 (1)
67Ni–30Cu–S	B 164 Gr. N04405 (1)(2)		

NOTES:
(1) Use annealed material only.
(2) The chemical composition, mechanical properties, heat treating requirements, and grain size requirements shall conform to the applicable ASTM specification. The manufacturing procedures, tolerances, tests, certification, and markings shall be in accordance with ASTM B 564.

61Ni-16Mo-16Cr	B 574 Gr. N06455 (1)(2)(6)		B 575 Gr. N06455 (1)(6)
42Ni-21.5Fe-3Cr-2.3Cu	B 564 Gr. N08825 (3)(7)		B 424 Gr. N08825 (3)(7)

NOTES:
(1) Use solution annealed material only.
(2) The chemical composition, mechanical properties, heat treating requirements, and grain size requirements shall conform to the applicable ASTM specification. The manufacturing procedures, tolerances, tests, certification, and markings shall be in accordance with ASTM B 564.
(3) Use annealed material only.
(4) Not to be used over 1250°F.
(5) Not to be used over 1200°F. Alloy N06625 in the annealed condition is subject to severe loss of impact strength at room temperatures after exposure in the range of 1000°F to 1400°F.
(6) Not to be used over 800°F.
(7) Not to be used over 1000°F.

NOTES:
(1) Use solution annealed material only.
(2) The chemical composition, mechanical properties, heat treating requirements, and grain size requirements shall conform to the applicable ASTM specification. The manufacturing procedures, tolerances, tests, certification, and markings shall be in accordance with ASTM B 564.

FLANGED FITTINGS

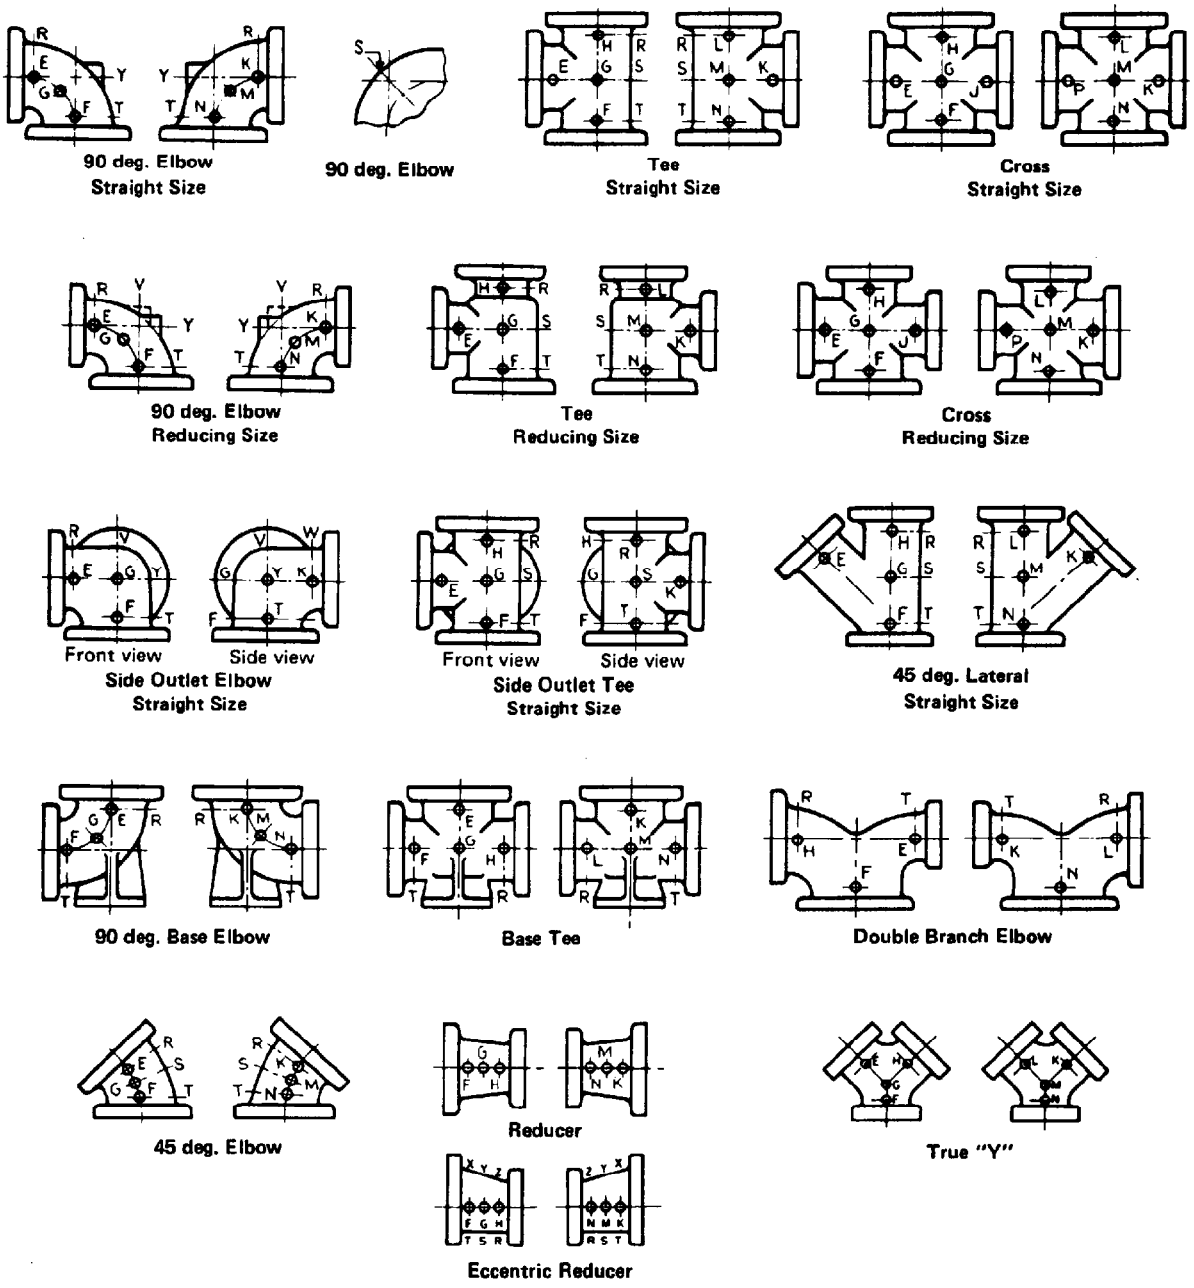

FIG. 1 METHOD OF DESIGNATING LOCATION OF AUXILIARY CONNECTIONS WHEN SPECIFIED[1]

NOTE:
(1) The above sketches show views of the same fitting and represent fittings with symmetrcial shapes, with the exception of the side outlet elbow and the side outlet tee (straight sizes). Sketches are illustrative only and do not imply required design (see para. 6.12).

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:16 2005

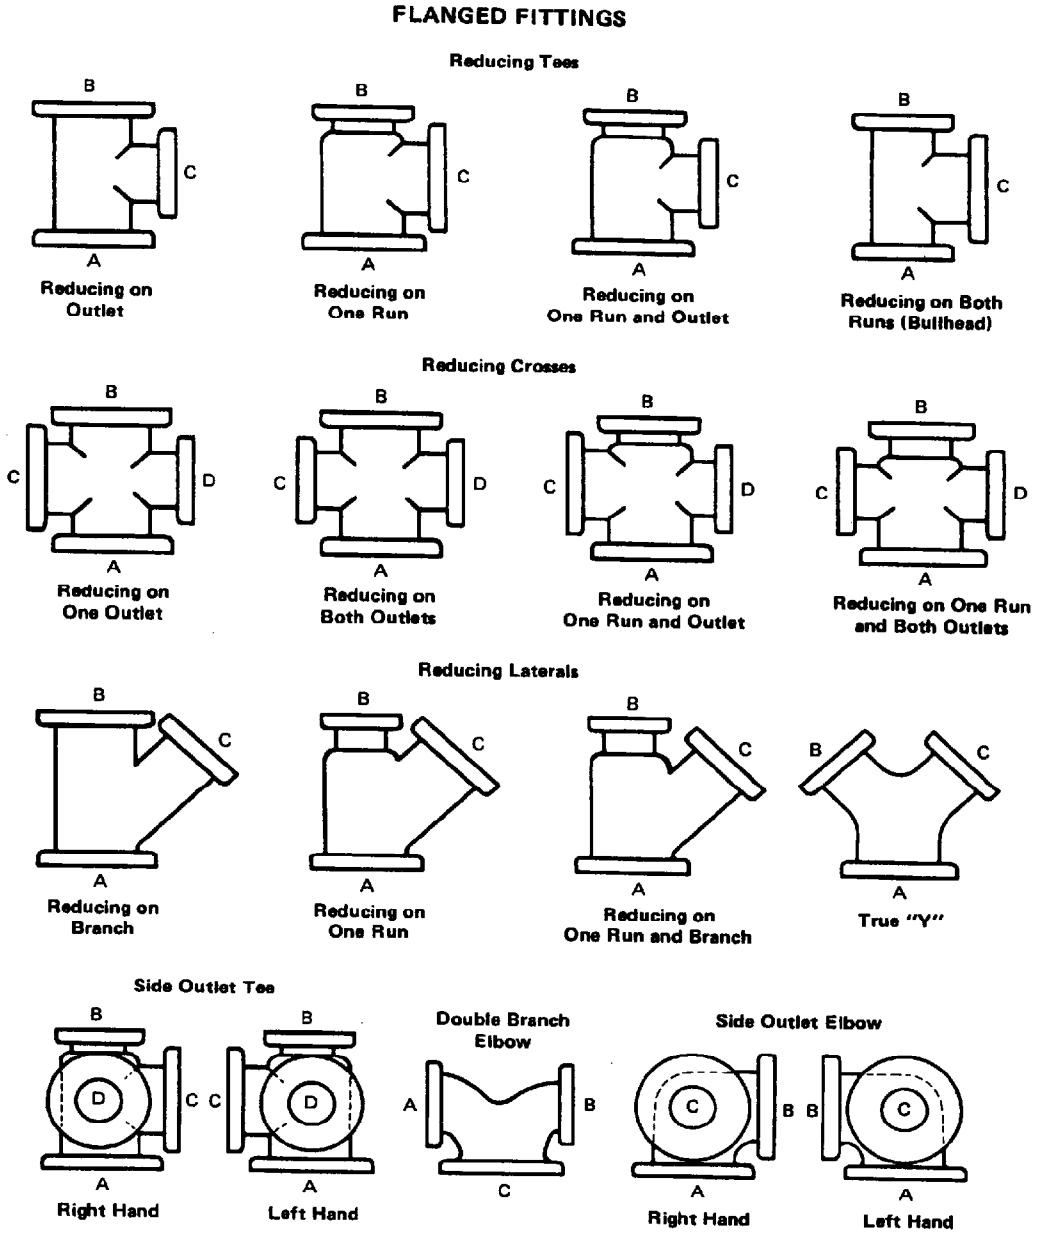

FIG. 2 METHOD OF DESIGNATING OUTLETS OF REDUCING FITTINGS IN SPECIFICATIONS[1-3]

NOTES:

(1) The largest opening establishes the basic size of a reducing fitting. The largest opening is named first, except that for bull head tees which are reducing on both runs and for double branch elbows where both branches are reducing, the outlet is the largest opening and named last in both cases.

(2) In designating the openings of reducing fittings, they should be read in the order indicated by the sequence of the letters A, B, C, and D. In designating the outlets of side outlet reducing fittings, the side outlet is named last, and in the case of the cross which is not shown, the side outlet is designated by the letter E.

(3) Sketches are illustrative only and do not imply required design (see para. 3.2).

END FLANGE FACINGS
Flange Thickness and End-to-End Dimensions
Lapped Joints

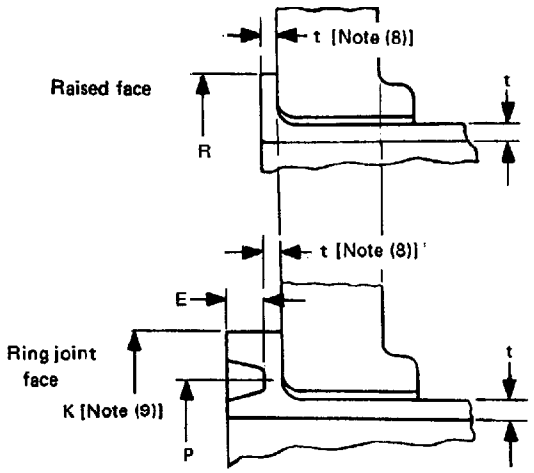

FIG. 7 END FLANGE FACINGS AND THEIR RELATIONSHIP TO FLANGE THICKNESS AND CENTER-TO-END AND END-TO-END DIMENSIONS[1,3] (CONT'D)

NOTES:
(1) See paras. 6.2 and 6.4.1.
(2) See Tables 10, 13, 16, 19, 22, 25, and 28.
(3) See Table 4 for dimensions of facings (other than ring joint) and Table 5 for ring joint facing.
(4) For small male and female joints, care should be taken in the use of these dimensions to insure that the inside diameter of fitting or pipe is small enough to permit sufficient bearing surface to prevent the crushing of the gasket. (See Table 4.) This applies particularly on lines where the joint is made on the end of the pipe. Threaded companion flanges for small male and female joints are furnished with plain face and are threaded with American National Standard Locknut Thread (NPSL).
(5) Large male and female faces and large tongue and groove are not applicable to Class 150 because of potential dimensional conflicts.
(6) See Table 4.
(7) See Table 5.
(8) See para. 6.4.2.
(9) See para. 6.4.2.5 and Table 5.

TABLE 4 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For facing requirements for flanges and flanged fittings, see paras. 6.3 and 6.4 and Fig. 7.
(2) For facing requirements for lapped joints, see para. 6.4.2 and Fig.7.
(3) For facing tolerances, see para. 7.2.
(4) See para. 6.4.2 and Fig. 7 for thickness and outside diameters of laps.
(5) For small male and female joints, care should be taken in the use of these dimensions to insure that the inside diameter of fitting or pipe is small enough to permit sufficient bearing surface to prevent the crushing of the gasket. This applies particularly on lines where the joint is made on the end of the pipe. Inside diameter of fitting should match inside diamter of pipe as specified by purchaser. Threaded companion flanges for small male and female joints are furnished with plain face and are threaded with American National Standard Locknut Thread (NPSL).
(6) Raised portion of full face may be furnished unless otherwise specified on order.
(7) Large male and female faces and large tongue and groove are not applicable to Class 150 because of potential dimensional conflicts.
(8) Height of raised face is either 0.06 in. or 0.25 in. See para. 6.4.1.
(9) Height of large and small male and tongue is 0.25 in.
(10) Depth of groove or female is 0.19 in.

TABLE 5 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) Height of raised portion is equal to the depth of groove dimension E, but is not subjected to the tolerances for E. Former full-face contour may be used.
(2) For facing requirements for flanges and flanged fittings, see para. 6.4.1 and Fig. 7.
(3) For facing requirements for lapped joints, see para. 6.4.2 and Fig. 7.
(4) See para. 4.1.7 for marking requirements.
(5) Use Class 600 in sizes NPS ½ to NPS 3½ for Class 400.
(6) Use Class 1500 in sizes NPS ½ to NPS 2½ for Class 900.
(7) For ring joints with lapped flanges in Classes 300 and 600, ring and groove number R30 are used instead of R31.

TOLERANCES:

E	(depth) +0.016, −0
F	(width) ±0.008
P	(pitch diameter) ±0.005
R	(radius at bottom)
	R ≤ 0.06 +0.03, −0
	R > 0.06 ±0.03
23 deg.	(angle) ± ½ deg.

WELDING ENDS
(Welding Neck Flanges, No Backing Rings)

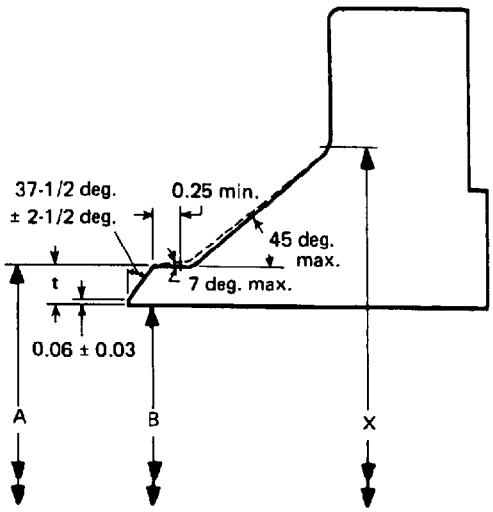

FIG. 8 BEVEL FOR WALL THICKNESSES t FROM 0.19 in. TO 0.88 in., INCLUSIVE[1-3]

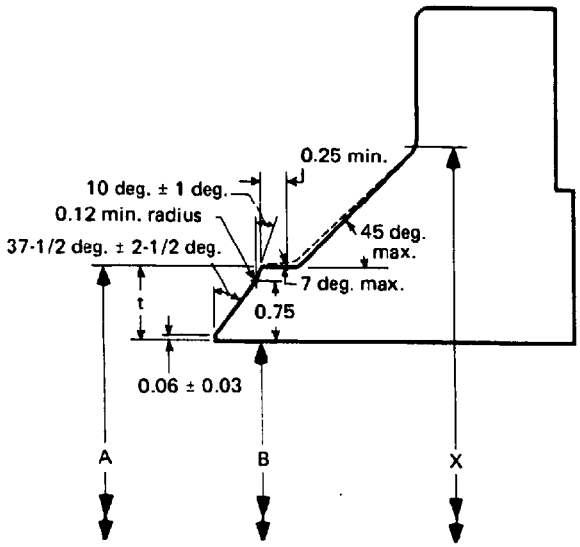

FIG. 9 BEVEL FOR WALL THICKNESSES t GREATER THAN 0.88 in.[1-3]

A = nominal outside diameter of pipe, in.
B = nominal inside diameter of pipe, in.
t = nominal wall thickness of pipe, in.

NOTES:
(1) See paras. 6.7, 6.8, and 7.4 for details and tolerances.
(2) See Figs. 10 and 11 for additional details of welding ends.
(3) When the thickness of the hub at the bevel is greater than that of the pipe to which the flange is joined and the additional thickness is provided on the outside diameter, a taper weld having a slope not exceeding 1 to 3 may be employed or, alternatively, the greater outside diameter may be tapered, at the same maximum slope or less, from a point on the welding bevel equal to the outside diameter of the mating pipe. Similarly, when the greater thickness is provided on the inside of the flange, it shall be taper-bored from the welding end at a slope not exceeding 1 to 3.

When flanges covered by this Standard are intended for services with light wall, higher strength pipe, the thickness of the hub at the bevel may be greater than that of the pipe to which the flange is joined. Under these conditions a single taper hub may be provided, and the outside diameter of the hub at the base (dimension X) may also be modified.

The additional thickness may be provided on either inside or outside or partially on each side, but the total additional thickness shall not exceed one-half times the nominal wall thickness of intended mating pipe. See Figs. 12, 13, and 14.

WELDING ENDS
(Welding Neck Flanges With Backing Rings)

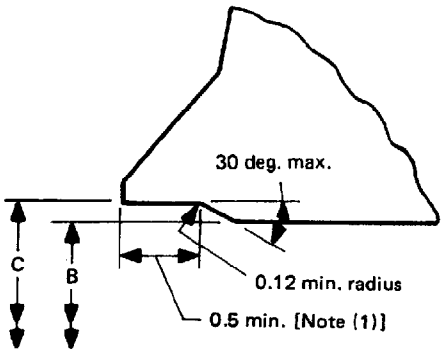

FIG. 10 INSIDE CONTOUR FOR USE WITH RECTANGULAR BACKING RING[1-4]

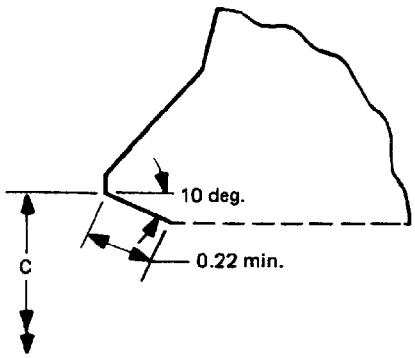

FIG. 11 INSIDE CONTOUR FOR USE WITH TAPER BACKING RING[1-4]

A = nominal outside diameter of welding end, in.
B = nominal inside diameter of pipe, in.
= A − 2t
C = A − 0.031 − 1.75t − 0.010 in.
t = nominal wall thickness of pipe, in.
0.031 = minus tolerance on outside diameter of pipe, in., to ASTM A 106, etc.
1.75t = 87½% of nominal wall (permitted by ASTM A 106, etc.) multiplied by two to convert into terms of diameter
0.010 = plus tolerance on diameter C, in. See para. 7.5.3.

NOTES:
(1) 0.5 in. depth based on use of 0.75 in. wide backing ring.
(2) See paras. 6.7, 6.8, and 7.5 for details and tolerances.
(3) See Figs. 8 and 9 for welding end details of welding neck flanges.
(4) For dimensions, see Table 6.

WELDING ENDS
(Welding Neck Flanges)
ADDITIONAL THICKNESS FOR
WELDING TO HIGHER STRENGTH PIPE

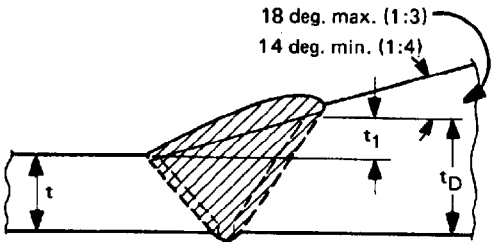

FIG. 12 BEVEL FOR OUTSIDE THICKNESS[1-4]

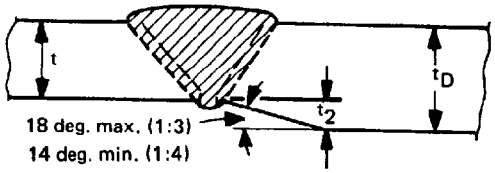

FIG. 13 BEVEL FOR INSIDE THICKNESS[1-3]

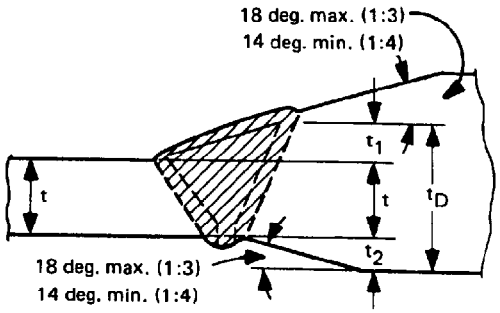

FIG. 14 BEVEL FOR COMBINED THICKNESS[1-4]

NOTES:
(1) When the materials joined have equal minimum specified yield strength, there shall be no restriction on the minimum slope.
(2) Neither t_1, t_2, nor their sum $t_1 + t_2$ shall exceed 0.5t.
(3) When the minimum specified yield strengths of the sections to be joined are unequal, the value of t_D shall at least equal times the ratio of minimum specified yield strength of the pipe to minimum specified yield strength of the flange.
(4) Welding shall be in accordance with the applicable code.

TABLE 6 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) Designations per Annexes B and C and ASME B36.10:
STD = standard wall thickness
XS = extra-strong wall thickness
XXS = double extra-strong wall thickness
(2) For tolerances, see para. 7.4.
(3) There is no fixed relation between ASME B16.5 pressure classes and pipe schedules.
(4) When the wall thickness is less than 0.562 in., it may be necessary to provide additional material by weld deposition in order to be able to machine to the dimension C.

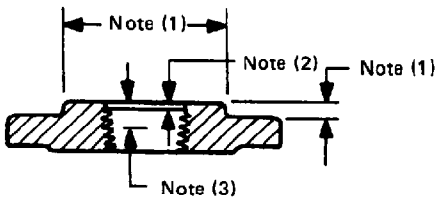
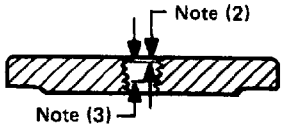
REDUCING THREADED AND SLIP-ON PIPE FLANGES





Blind Flange

TABLE 7 REDUCING THREADED AND SLIP-ON FLANGES FOR CLASSES 150 TO 2500

1	2	3	4	5	6
Nominal Pipe Size (4)	Smallest Size (1) of Reducing Outlet Requiring Hub Flanges	Nominal Pip Size (4)	Smallest Size (1) of Reducing Outlet Requiring Hub Flanges	Nominal Pipe Size (4)	Smallest Size (1) of Reducing Outlet Requiring Hub Flanges
1	½	3½	1½	12	3½
1¼	½	4	1½	14	3½
1½	½	5	1½	16	4
2	1	6	2½	18	4
2½	1¼	8	3	20	4
3	1¼	10	3½	24	4

NOTES:

(1) The hub dimensions shall be at least as large as those of the standard flanges of the size to which the reduction is being made, except flanges reducing to a size smaller than those of Columns 2, 4, and 6 may be made from blind flanges. See Example 2.

(2) Class 150 flanges do not have a counterbore. Class 300 and higher pressure flanges will have depth of counterbore q of 0.25 in. for NPS 2 and smaller tapping and 0.38 in. for NPS 2½ and larger. The diameter Q of counterbore is the same as that given in the tables of threaded flanges for the corresponding tapping.

(3) Minimum length of effective threads shall be at least equal to dimension T of the corresponding pressure class threaded flange as shown in tables but does not necessarily extend for the face of the flange. For thread of threaded flanges, see para. 6.9.

(4) For method of designating reducing threaded flanges, see para. 3.3 and Examples below.

EXAMPLES:

(1) The size designation is NPS 6 × 2½ — Class 300 reducing threaded flange. This flange has the following dimensions:

NPS 2½ = taper pipe thread tapping (ASME B1.20.1)
12.5 in. = diameter of regular NPS 6 Class 300 threaded flange
1.44 in. = thickness of regular NPS 6 Class 300 threaded flange
7.0 in. = diameter of hub for regular NPS 5 Class 300 threaded flange
0.62 in. = height of hub for regular NPS 5 Class 300 thread flange

Other dimensions the same as for regular NPS 6 Class 300 threaded flange, Table 12.

(2) The size designation is NPS 6 × 2 — Class 300 reducing threaded flange. Use regular NPS 6 Class 300 blind flange tapped with NPS 2 taper pipe thread (ASME B1.20.1).

TABLE 9 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, socket-welding, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 8.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the manufacturer's option.
(8) For reducing welding neck flanges, see para. 6.8.
(9) The minimum thickness of these loose flanges, in sizes NPS $3\frac{1}{2}$ and smaller, is slightly greater than the thickness of flanges on fittings, Table 10, which are reinforced by being cast integral with the body of the fitting.
(10) When these flanges are required with flat face, either the full thickness or thickness with raised face removed may be furnished. Users are reminded that removing the raised face will make the length through the hub nonstandard. See para. 6.4.1.1 for additional restrictions.
(11) The flange dimensions illustrated are for regularly furnished 0.06 in. raised face (except lapped); for requirements of other facings, see Fig. 7.
(12) For welding end bevel, see para. 6.7.
(13) For thread of threaded flanges, see para. 6.9.
(14) Dimensions in Column 12 correspond to the inside diameters of pipe as given in ASME B36.10M for Standard Wall pipe. Thickness of Standard Wall is the same as Schedule 40 in sizes NPS 10 and smaller. Tolerances in para. 7.4.2 apply. These bore sizes are furnished unless otherwise specified by the purchaser.

TABLE 10 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 8.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) The thickness of flange minimum dimensions for loose flanges, Table 9, sizes $3\frac{1}{2}$ in. and smaller, are slightly heavier than for flanges on these fittings which are reinforced by being cast integral with the body of the fitting.
(10) When these fittings are required with flat face flange, either the full thickness or thickness with raised face removed may be furnished. Users are reminded that removing the raised face will make the center-to-face dimension nonstandard. See para. 6.4.1.1 for additional restrictions.
(11) The thickness of flange dimension illustrated is for regularly furnished 0.06 in. raised face (except lapped); for thickness requirements of other facings, see Fig. 7.
(12) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(13) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(14) These dimensions apply to straight sizes only. See paras. 6.2.3 and 6.4.1.3. For center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-contact surface or contact surface-to-contact surface dimensions of 0.06 in. raised face (flange edge) for largest opening and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(15) The base dimensions apply to all straight and reducing sizes.
(16) The reducing fittings, the size and center-to-face dimension of base are determined by the size of the largest opening of fittings. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(17) Bases shall be plain faced unless otherwise specified, and the center-to-base dimension R shall be the finished dimension.
(18) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(19) The bolt hole template is the same as for Class 150 flanges, Table 8, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 11 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) Length of stud bolt does not include the height of the points. See para. 6.10.2.
(2) For other dimensions, see Tables 12 and 13.
(3) For flange bolt holes, see para. 6.5.
(4) For spot facing, see para. 6.6.
(5) Bolt lengths not shown in Table are determined in accordance with Annex F. See para. 6.10.2.

TABLE 12 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, socket-welding, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 11.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the option of the manufacturer.
(8) For reducing welding neck flanges, see para. 6.8.
(9) When these flanges are required with flat face, either the full thickness or thickness with raised face removed may be furnished. Users are reminded that removing the raised face will make the length through the hub nonstandard. See para. 6.4.1.1 for additional restrictions.
(10) The flange dimensions illustrated are for regularly furnished 0.06 in. raised face (except lapped); for requirements of other facings, see Fig. 7.
(11) For welding end and bevel, see para. 6.7.
(12) For thread of threaded flanges, see para. 6.9.
(13) Dimensions in Column 12 correspond to the inside diameters of pipe as given in ASME B36.10M for Standard Wall Pipe. Standard Wall dimensions are the same as Schedule 40 in sizes NPS 10 and smaller. Tolerances in para. 7.5.2 apply. These bore sizes are furnished unless otherwise specified by the purchaser.

TABLE 13 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 11.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) When these fittings are required with flat face flange, either the full thickness or thickness with raised face removed may be furnished. Users are reminded that removing the raised face will make the center-to-face dimension nonstandard. See para. 6.4.1.1 for additional restrictions.
(10) The thickness of flange dimension illustrated is for regularly furnished 0.06 in. raised face (except lapped); for thickness requirement of other facings, see Fig. 7.
(11) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(12) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(13) These dimensions apply to straight sizes only. See paras. 6.2.3 and 6.4.1.3. For center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-contact surface or contact surface-to-contact surface dimensions of 0.06 in. raised face (flange edge) for largest opening and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(14) The base dimensions apply to all straight and reducing sizes.
(15) For reducing fittings, the size and center-to-face dimension of base are determined by the size of the largest opening of fittings. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(16) Bases shall be plain faced unless otherwise specified, and the center-to-base dimension R shall be the finished dimension.
(17) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(19) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 15 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 14.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the manufacturer's option.
(8) For reducing welding neck flanges, see para. 6.8.
(9) For welding end bevel, see para. 6.7.
(10) For threads in threaded flanges, see para. 6.9.
(11) Socket welding flanges may be provided in NPS ½ through 2½ using Class 600 dimensions.

TABLE 16 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 14.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(10) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(11) These dimensions apply to straight sizes only. (See paras. 6.2.3 and 6.4.1.3.) For the center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-flange edge or flange edge-to-flange edge dimensions for largest opening, and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(12) The base dimensions apply to all straight and reducing sizes.
(13) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(14) Bases shall be plain faced unless otherwise specified, and the center-to-base face dimension R shall be the finished dimension.
(15) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(16) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 17 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) Length of stud bolt does not include the height of the points. See para. 6.10.2.
(2) For other dimensions, see Tables 18 and 19.
(3) For flange bolt holes, see para. 6.5.
(4) For spot facing, see para. 6.6.
(5) Bolt lengths not shown in Table are determined in accordance with Annex F. See para. 6.10.2.

TABLE 19 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 17.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(10) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(11) These dimensions apply to straight sizes only. (See paras. 6.2.3 and 6.3.1.3.) For the center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-flange edge or flange edge-to-flange edge dimensions for largest opening, and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(12) The base dimensions apply to all straight and reducing sizes.
(13) For reducing fittings the size and center-to-face dimensions of base are determined by the size of the largest opening of fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(14) Bases shall be plain faced unless otherwise specified, and the center-to-base face dimension R shall be the finished dimensions.
(15) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(16) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 20 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) Length of stud bolt does not include the height of the points. See para. 6.10.2.
(2) For other dimensions, see Tables 21 and 22.
(3) For flange bolt holes, see para. 6.5.
(4) For spot facing, see para. 6.6.
(5) Bolt lengths not shown in Table are determined in accordance with Annex F. See para. 6.10.2.

TABLE 21 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:
(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, socket welding, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 20.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the manufacturer's option.
(8) For reducing welding neck flanges, see para. 6.8.
(9) For welding end bevel, see para. 6.7.
(10) For threads in threaded flanges, see para. 6.9.
(11) Socket welding flanges may be provided in NPS ½ through 2½ using Class 1500 dimensions.

(3) For flange bolt holes, see para. 6.5 and Table 20.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(10) For contact surface-to-contact surface and center-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(11) These dimensions apply to straight sizes only. (See paras. 6.2.3 and 6.3.1.3.) For the center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-flange edge or flange edge-to-flange edge dimensions for largest opening, and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.
(12) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(13) Bases shall be plain faced unless otherwise specified, and the center-to-base face dimension R shall be the finished dimension.
(14) The base dimensions apply to all straight and reducing sizes.
(15) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(16) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 24 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, socket welding, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 23.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the manufacturer's option.
(8) For reducing welding neck flanges, see para. 6.8.
(9) For welding end bevel, see para. 6.7.
(10) For threads in threaded flanges, see para. 6.9.

TABLE 25 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 23.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(10) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(11) These dimensions apply to straight sizes only. (See paras. 6.2.5 and 6.3.1.3.) For the center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-flange edge or flange edge-to-flange edge dimensions for largest opening, and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimension.
(12) The base dimensions apply to all straight and reducing sizes.
(13) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
(14) Bases shall be plain faced unless otherwise specified, and the center-to-base dimension R shall be the finished dimension.
(15) Bases may be cast integral or attached as weldments at the option of the manufacturer.
(16) The bolt hole template for round base is the same as for Class 300 flanges, Table 11, of corresponding outside diameter, except using only four holes in all cases so placed as to straddle center lines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

TABLE 27 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) This dimension is for large end of hub, which may be straight or tapered. Taper shall not exceed 7 deg. on threaded, slip-on, socket welding, and lapped flanges.
(2) For tolerances, see Section 7.
(3) For facings, see para. 6.4.
(4) For flange bolt holes, see para. 6.5 and Table 26.
(5) For spot facing, see para. 6.6.
(6) For reducing threaded and slip-on flanges, see Table 7.
(7) Blind flanges may be made with or without hubs at the manufacturer's option.
(8) For reducing welding neck flanges, see para. 6.8.
(9) For welding end bevel, see para. 6.7.
(10) For threads in threaded flanges, see para. 6.9.

TABLE 28 (CONT'D)

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) For tolerances, see Section 7.
(2) For facings, see para. 6.4.
(3) For flange bolt holes, see para. 6.5 and Table 26.
(4) For spot facing, see para. 6.6.
(5) For intersecting center lines, center-to-contact surface, and center-to-end dimensions of side outlet fittings, see para. 6.2.4.
(6) For center-to-contact surface and center-to-end dimensions of special degree elbows, see para. 6.2.5.
(7) For reinforcement of certain fittings, see para. 6.1.
(8) For drains, see para. 6.12.
(9) For center-to-contact surface and center-to-end dimensions of reducing fittings, see para. 6.2.3.
(10) For contact surface-to-contact surface and end-to-end dimensions of reducers and eccentric reducers, see para. 6.2.3.
(11) These dimensions apply to straight sizes only. (See paras. 6.2.3 and 6.4.1.3.) For the center-to-end dimensions of reducing fittings or end-to-end dimensions of reducers, use center-to-flange edge or flange edge-to-flange edge dimensions for largest opening, and add the proper height to provide for ring joint groove applying to each flange. See Table 5 for ring joint facing dimensions.

ANNEX A

THREADING OF PIPE FOR AMERICAN NATIONAL STANDARD THREADED FLANGES

(This Annex is an integral part of ASME B16.5-1996 and is placed after the main text for convenience.)

The length of external taper threads in ASME B1.20.1 is sufficient to provide a satisfactory joint when assembled with corresponding internal taper threads in couplings and fittings. In this Standard, the length of internal thread in Class 150, Class 300, and Class 400 flanges also conforms to ASME B1.20.1.

In Class 600 and higher rated flanges, the length through the hub may exceed the length for internal threads in ASME B1.20.1. Where this occurs, the extended length of internal threads follows the taper of the standard taper threads. Therefore, the diameters of the extra threads are smaller than those shown in ASME B1.20.1.

When threaded flanges conforming to this Standard are assembled with threaded-end pipe, it is intended that the end of the pipe be reasonably close to the mating surface of the flange. To meet this intent, the following requirements are imposed on the mating pipe and external thread.

(1) Pipe to be threaded into flanges of Class 600 or higher rating shall be Schedule 80 or heavier in wall thickness.

(2) The length of external effective thread on the pipe end shall be greater than specified in ASME B1.20.1. When tested with the standard ring gage, the pipe end shall project beyond the gage by the distance specified in Table A1, subject to a tolerance of one thread pitch as provided in ASME B1.20.1.

(3) The extra threads shall continue the taper specified in ASME B1.20.1, so that the pitch diameter of the thread at the pipe end is less than specified therein.

(4) It is recommended that power equipment be used to assemble threaded joints having longer than standard taper threads, in order to bring the pipe end close to the flange face.

24	24.000	**0.375**	0.500	. . .

GENERAL NOTES:

(a) The decimal thicknesses listed for the respective sizes represent their nominal dimensions as given in ASME B36.10M. For tolerances on wall thicknesses, see appropriate material specifications.

(b) Thicknesses shown in bold face type for Standard Wall are identical with corresponding thicknesses shown in bold face type for Schedules 20, 30, and 40 in Annex C. Those shown in bold face type for Extra Strong Wall are identical with corresponding thicknesses shown in bold face type in Schedules 60 and 80 in Annex C. Double Extra Strong Wall has no corresponding schedule numbers.

30	30.000	0.312	0.500	0.625	...	...	...	...	...	...	...

GENERAL NOTES:

(a) The decimal thicknesses listed for the respective pipe sizes represent their nominal dimensions as given in ASME B36.10M. For tolerances on wall thicknesses, see appropriate material specifications.

(b) Thicknesses shown in bold face type for Schedules 20, 30, and 40 are identical with thicknesses shown in bold face type for Standard Wall pipe in Annex B. Those in bold face type Schedules 60 and 80 are identical with thicknesses in bold face type for Extra Strong Wall in Annex B.

(c) Some of the larger heavier wall sections are beyond the capabilities of seamless mill production and must be obtained from turned-and-bored billets or other sources.

ANNEX D
METHODS FOR ESTABLISHING PRESSURE–TEMPERATURE RATINGS

(This Annex is not part of ASME B16.5-1996 and is included for information only.)

D1 GENERAL

D1.1 Introduction

Pressure–temperature ratings in this Standard have been determined by the procedures in this Annex.

The primary consideration in establishing ratings is adequate wall thickness to sustain stresses due to pressure and other loadings. See para. D1.2. Other considerations affecting or limiting the ratings include:

(1) stresses in flanges resulting from bolt-up necessary to maintain gasket seal;

(2) distortion of flanges and flanged fittings due to loadings transmitted through the pipeline; and

(3) limitations applying primarily to valves but imposed also on flanges in order to maintain compatible ratings.

D1.2 Wall Thickness

Wall thickness requirements for flanged fittings are set forth in para. 6.1, and minimum thicknesses t_m are listed in the tables designated in para. 6.1. These values are all greater than those determined by Eq. (1):

$$t = 1.5\ P_c d/(2S - 1.2\ P_c) \qquad (1)$$

where

t = calculated thickness, in.
P_c = pressure rating class designation, psi (e.g., P_c = 150 psi for Class 150)
d = inside diameter of the fitting, in.
S = stress factor of 7000 psi

Equation (1) gives a thickness 50% greater than for a simple cylinder designed for a stress of 7000 psi when subjected to an internal pressure equal to the pressure rating class designation in pounds per square inch. Actual values in the dimension tables listed in para. 6.1 are approximately 0.1 in. to 0.2 in. heavier than those given by the equation.

D1.3 Material Groups

Material groups in Tables 1A are based on identical or closely matched allowable stress and yield strength values. Where they are not identical, the lower value has been applied.

Note that material groups are not numbered consecutively. Some groups are intended for use only in valves. See ASME B16.34.

D1.4 Material Properties

The allowable stress and yield strength values used to calculate the pressure–temperature ratings were taken from the ASME Boiler and Pressure Vessel Code, Section II, Part D. In addition, data has been provided directly by the ASME Boiler and Pressure Vessel Subcommittee on Materials.

D2 RATINGS IN CUSTOMARY UNITS

D2.1 Rating Equation

Ratings given in Table 2 in pounds per square inch (gage) at temperatures expressed in degrees Fahrenheit, for all materials and pressure classes, are established by Eq. (2):

$$P_T = P_r S_1/8750 \le P_c \qquad (2)$$

P_c = ceiling pressure, psig, as specified in D3 at temperature T
P_T = rated working pressure, psig, for the specified material at temperature T
P_r = pressure rating class index, psi[1] (e.g., P_r = 300 psi for Class 300)
S_1 = selected stress, psi, for the specified material at temperature T. See paras. D2.2, D2.3, and D2.4.

[1] This definition of P_r does not apply to Class 150. See para. D2.4.

D2.2 Ratings for Group No. 1 Materials, Class 300 and Higher

The selected stress S_1 for each Material Group among Group No. 1 materials in Table 1A is determined as follows:

(a) At temperatures below the creep range, S_1 shall be lowest of the following values:

(1) 60% of specified minimum yield strength at 100°F;

(2) 60% of the yield strength at temperature T;

(3) 1.25 times the allowable stress at temperature T as listed for ASME Boiler and Pressure Vessel Code, Section I;

(b) At temperatures in the creep range (defined as those above 700°F for Group No. 1 materials), S_1 shall be the lowest of the following values:

(1) 60% of the yield strength at temperature T;

(2) the allowable stress at Temperature T as listed for ASME Boiler and Pressure Vessel Code, Section I;

(c) In no case shall the value of S_1 increase with increasing temperature.

(d) Yield strength values for determination of values of S_1 shall be obtained from ASME Boiler and Pressure Vessel Code, Section II, Part D.

(e) Where more than one allowable stress value is listed for a material at any temperature, the lower values shall be used. If lower allowable stress values do not appear, and it is noted in the allowable stress table that the allowable stress values exceed two-thirds of the yield strength at temperature, then the allowable stress values shall be determined as two-thirds of the tabulated yield strength at temperature.

(f) Allowable stress values listed for ASME Boiler and Pressure Vessel Code, Section VIII, Division 1, may be used only if the material is not listed for Section I. Allowable stress values listed for ASME Boiler and Pressure Vessel Code, Section III, Classes 2 and 3, may be used only if the material is not listed for either Section I or Section VIII, Division 1.

D2.3 Ratings for Group Nos. 2 and 3 Materials, Class 300 and Higher

The selected stress S_1 for each material group among Group Nos. 2 and 3 materials in Table 1A is determined as follows.

(a) At temperatures below the creep range, S_1 is determined in accordance with para. D2.2(a), except that 70% of yield strength shall be used, instead of 60%, in paras. D2.2(a)(1) and (2).

(b) At temperatures in the creep range (defined as those above 950°F for Group No. 2 materials), S_1 is determined in accordance with para. D2.2(b). For Group No. 3 materials, the creep range temperature limits shall be determined on an individual material basis.

(c) The limitations in paras. D2.2(c), (d), (e), and (f) apply.

D2.4 Ratings for Class 150, All Material Groups

Pressure–temperature ratings for Class 150 flanges and flanged fittings are determined for each Material Group as set forth in paras. D2.1, D2.2, and D2.3, with the following exceptions.

(a) The value of P_r in Eq. (2) (see para. D2.1) shall be 115 psi rather than 150 psi.

(b) The value for S_1 shall be in accordance with the requirements of paras. D2.1, D2.2, and D2.3.

(c) The value for P_T in Eq. (2) at temperature T (degrees Fahrenheit) shall not exceed that given by Eq. (3):

$$P_T = 320 - 0.3T \tag{3}$$

The limits of T in equation (3) are 100°F min. and 1000°F max. For values of T less than 100°F, T equal to 100°F is used.

D3 MAXIMUM RATINGS

D3.1 Maximum Ratings

A set of maximum or ceiling pressure–temperature ratings, P_c, are shown in Table D1. They are imposed to limit deflections.

ANNEX E

LIMITING DIMENSIONS OF GASKETS
Other than Ring Joint

(This Annex is an integral part of ASME B16.5-1996 and is placed after the main text for convenience.)

E1 SCOPE

This Annex covers gasket characteristics.

E2 GASKET MATERIALS AND CONSTRUCTION

Classification of gasket materials and types is shown in Fig. E1. Other gaskets, which result in no increase in both loads or flange moment over those resulting from the gaskets included in the respective groups in this Appendix, may be used and warrant the ratings of this Standard with the limiting dimensions of the applicable group. See also para. 5.4 for application of gaskets.

E3 GASKET DIMENSIONS

(a) The actual dimensions of a gasket must be established by the user. Reference to a dimensional standard for gaskets, such as ASME B16.21, is recommended. In any case, selected dimensions should be based on the type of gasket and its characteristics. These characteristics include its density, flexibility, resistance to the fluid and its temperature, and the necessity for satisfactorily compressing the gasket on its inside diameter, its outside diameter, or both. Also to be considered is the question of allowing a "pocket" at the gasket inside diameter (between the flange facings), or of allowing any intrusion of the gasket into the flange bore. Consideration should be given to the service fluid as well as to the possibility of damage which might result from partially disintegrated gaskets.

(b) Limiting gasket dimensions are given in Tables E1, E2, and E3. These dimensions represent approximately the maximum combinations of widths and diameters of the different types of gaskets covered which meet rating requirements. Variations which tend to reduce bolt loads and flange moments (e.g., reducing the gasket width) may be made; however, in departing from the tabulated dimensions, consideration should be given to the stability of the gasket under high bolt loads. As a general rule, the area of unconfined nonmetallic gaskets should not be less that the total bolt area.

(c) Gaskets are divided into three groups based on their gasket loading factors as shown in the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1, Pressure Vessels.

(d) Gasket contact widths for the three groups are as follows:

Group No. I	Slip-on flange raised face width
Group No. II	Large tongue width
Group No. III	Small tongue width minus 0.03 in., but not less than 0.18 in.

(e) Gaskets of Group No. Ia have inside diameters equal to the outside diameter of the corresponding pipe, which follows the principle established in ASME B16.21. In order to avoid pocketing of fluid handled, Group No. I gaskets may be extended to the inside diameter of valves, pipe, or the bore of integral, welding neck, or socket weld type flanges. Group No. Ia gaskets have outside contact diameters equal to the outside diameter of the raised face.

(f) Gaskets of Groups Nos. IIa and IIIa also have inside diameters equal to the outside diameter of the corresponding pipe. It may be desirable under some conditions to make the inside diameter of these gaskets equal to the inside diameter of valves, pipe, or the bore of integral, welding neck, or socket weld type flanges, and this is permissible provided the gasket contact width does not exceed that shown. This provision affects gaskets shown in Figs. E4, E5, E8, and E9 and requires a reduction in gasket outside diameters as well as inside diameters.

Additional provisions for varying gasket widths in contact with raised face are covered in para. E3(b). Group Nos. IIb and IIIb have outside contact diameters equal to the outside diameter of the raised face.

(g) The outside diameter of gaskets or centering

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:45:43 2005

rings extending beyond the raised face is equal to the bolt circle minus one bolt diameter. This type gasket is designed to be aligned by the flange bolts.

(h) Group Nos. IIa and IIIa gaskets are designed for those users who prefer that narrow gaskets be located close to the bore, thereby keeping the pressure area to a minimum and giving maximum flexibility to the flanged joint. See para. E3(f). Group Nos. IIb and IIIb gaskets are to be located at the outside of the raised face for ease in aligning the gaskets without a centering ring.

(i) Group No. Ia gaskets with edges extending to the bolts (see Fig. E3) are dimensionally the same as the corresponding flat ring gaskets given in ASME B16.21. See para. E3(c).

E4 TOLERANCES

Gasket contact widths for Group Nos. II and III shall not exceed specified contact width by more than 10%.

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) Applies to both Figs. E6 and E7. Gasket diameters may be varied, provided the gasket contact width does not exceed that shown, subject to tolerances in para. E4. See para. E3(d).

(2) Gasket outside diameter may be extended, or an attached centering device may be used. The outside diameter of extended metallic gasket or of any centering ring may be 0.12 in. less than specified.

(3) Slip-on type flanges are shown for illustration purposes only. Gaskets may be used with other types of flange. See para. E3(f).

GENERAL NOTE: Dimensions are in inches.

NOTES:

(1) Applies to both Figs. E10 and E11. Gasket diameters may be varied, provided the gasket contact width does not exceed that shown, subject to tolerances in para. E4. See para. E3(d).

(2) Gasket outside diameter may be extended, or an attached centering device may be used. The outside diameter of extended metallic gasket or of any centering ring may be 0.12 in. less than specified.

(3) Slip-on type flanges are shown for illustration purposes only. Gaskets may be used with other types of flange. See para. E3(f).

ANNEX F
METHOD FOR CALCULATING BOLT LENGTHS[1]

(This Annex is not part of ASME B16.5-1996 and is included for information only. See para. 6.10.2.)

The following formulas were used in establishing dimension L in Tables 8, 11, 14, 17, 20, 23, and 26. They are given for convenience in determining lengths not given in the tables.

$$L_{CSB} \text{ [See footnote (2)]} = A + n$$

$$L_{CMB} \text{ [See footnote (2)]} = B + n$$

where

A = $2(C + t + d) + G + F - a$, i.e., stud bolt length exclusive of negative length tolerance n

B = $2(C + t) + d + G + F + p - a$, i.e., machine bolt length exclusive of negative tolerance n

C = minimum flange thickness[3] (see Tables 9, 12, 15, 18, 21, 24, and 27)

F = total height of facings or depth of ring joint groove for both flanges (see Table F1)

G = 0.12 in. gasket thickness for raised face, male and female and tongue and groove flanges; also approximate distance between ring joint flanges listed in Table 5

L_{CMB} = calculated machine bolt length as measured from underside of head to end of point

L_{CSB} = calculated stud bolt length (effective thread length, excluding end points)

L_{SMB} = specified machine bolt length (from underhead to end, including end point) which is L_{CMB} rounded off to the nearest 0.25 in. increment (see Fig. F2)

L_{SSB} = specified stud bolt length (effective thread length, excluding end points) which is L_{CSB} rounded off to the nearest 0.25 in. increment (see Fig. F1)

a = zero, except where the small female face is on the end of pipe, a = 0.19 in.

d = heavy nut thickness (equals nominal bolt diameter, see ASME B18.2.2)

n = negative tolerance on bolt length (see Table F2)

p = allowance for height of point of machine bolt (= 1.5 times thread pitch)

t = plus tolerance for flange thickness (see para. 7.3)

[1] The equations used in this Annex are for calculated bolt lengths established to assure full thread engagement of heavy hexagon nuts when worst case tolerances occur on all relevant dimensions of the flanged joint. The use of shorter bolt lengths is acceptable provided that full thread engagement is obtained at assembly (see para. 6.10.2).

[2] For lapped joints calculate stud bolt and machine bolt lengths as follows.

For ring joint groove facing:

$$L_{CSB} = A + \text{(pipe thickness for each lap)} + n$$

$$L_{CMB} = B + \text{(pipe thickness for each lap)} + n$$

For other than ring joint facing:

$$L_{CSB} = A - F + \text{(Table F3 thicknesses)} + n$$

$$L_{CMB} = B - F + \text{(Table F3 thicknesses)} + n$$

[3] 0.06 in. raised face is included in minimum flange thickness for Classes 150 and 300 flanges.

TABLE F1 *F* VALUES

Flanged Joint Class	Total Height of Facings or Depth of Ring Joint Groove for Both Flanges *F*, in.			
	Type of Flange Facing (1)			
	0.06 in. Raised	0.25 in. Raised	Male and Female or Tongue and Groove	Ring Joint
150 and 300	Zero (2)	0.50	0.25	2 × groove depth
400 to 2500	0.12	0.50	0.25	2 × groove depth

NOTES:
(1) See Fig. 8 and Tables 4 and 5.
(2) Raised face (0.06 in.) is included in minimum flange thickess for Classes 150 and 300 flanges.

TABLE F2 *n* VALUES

Dimension	Negative Tolerance on Bolt Lengths *n*, in.	Length, in.
Stud Bolt		
A		
or	0.06	
[*A* + (pipe thickness for each lap)]	0.12	≤12
or	0.25	>12, ≤18
[*A* − *F* + (Table F3 thicknesses)]		>18
Machine Bolt		
B		
or	For *n* values, use negative length tolerances per ANSI B18.2.1.	. . .
[*B* + (pipe thickness for each lap)]		
or		
[*B* − *F* + (Table F3 thicknesses)]		

TABLE F3 THICKNESSES FOR LAPPED JOINTS

Lap Combination	Classes 150 and 300 Flanges	Classes 400 to 2500 Flanges, inclusive
For lapped to 0.06 in. raised face	One lap	. . .
For lapped to lapped	Both laps	Both laps
For lapped to 0.25 in. male face on flange	. . .	One lap and 0.25 in.
For lapped to female face on flange	. . .	One lap not less than 0.25 in.
For male in lap to female in lap	. . .	2 × pipe wall with lap for male not less than 0.25 in.

ANNEX G
QUALITY SYSTEM PROGRAM

(This Annex is an integral part of ASME B16.5.1996 and is placed after the main text for convenience.)

The products manufactured in accordance with this Standard shall be produced under a quality system program following the principles of an appropriate standard from the ISO 9000 series.[1] A determination of the need for registration and/or certification of the product manufacturer's quality system program by an independent organization shall be the responsibility of the manufacturer. The detailed documentation demonstrating program compliance shall be available to the purchaser at the manufacturer's facility. A written summary description of the program utilized by the product manufacturer shall be available to the purchaser upon request. The product manufacturer is defined as the entity whose name or trademark appears on the product in accordance with the marking or identification requirements of this Standard.

[1] The series is also available from the American National Standards Institute (ANSI) and the American Society for Quality Control (ASQC) as American National Standards that are identified by a prefix "Q" replacing the prefix "ISO". Each standard of the series is listed under Annex H.

ADOPTION NOTICE

ASME-B16.9, "Fittings, Steel Buttwelding, Factory-Made Wrought," was adopted on October 3, 1994 for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Commanding Officer, Naval Construction Battalion Center, Code 156, 1000 23rd Avenue, Port Hueneme, CA 93043-4301. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from the American Society of Mechanical Engineers, 345 East 47th Street, New York, NY 10017.

Date of Issuance: June 22, 2001

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda issued to this edition. The next edition of this Standard is scheduled for publication in 2005.

ASME will issue written replies to inquiries concerning interpretation of technical aspects of this Standard.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

In 1921, the American Engineering Standards Committee, later American Standards Association (ASA), organized Sectional Committee B16 to unify and further develop national standards for pipe flanges and fittings (and, later, for valves, gaskets, and valve actuators). Cosponsors of the B16 Committee were the American Society of Mechanical Engineers (ASME), the Heating and Piping Contractors National Association [now the Mechanical Contractors Association of America (MCAA)], and the Manufacturers Standardization Society of the Valve and Fittings Industry (MSS). Cosponsors were later designated as cosecretariat organizations.

Standardization of welding fittings was initiated in 1937 by a subgroup (designated Subgroup 6) of Subcommittee 3. After consideration of several drafts, a standard was approved by the Committee, cosponsors, and ASA, and published with the designation ASA B16.9-1940.

Revisions were made in 1950 and 1955 to add sizes up to NPS 24 and to complete coverage of fittings in some sizes. These revisions were approved and published as ASA B16.9-1951 and ASA B16.9-1958. With the subgroup now designated Subcommittee 6 (later Subcommittee F), further revisions were begun to clarify the intent of the standard, to add angularity tolerances, and to include fittings of different types (long radius-reducing elbows and crosses) and smaller sizes (NPS $\frac{1}{4}$ and $\frac{1}{2}$). This revision was published as ASA B16.9-1964 after ASA approval.

After reorganization of ASA, first as the United States of America Standards Institute (USASI), then as the American National Standards Institute (ANSI), with the Sectional Committee being redesignated as an American National Standards Committee, another revision increasing the size range to NPS 48 and revising the text for clarity was approved and published as ANSI B16.9-1971.

In 1975, Subcommittee F began a major revision to bring the standard up to date with current practice and usage. Common fractions were expressed as decimals (but without intending higher precision) and metric dimensional equivalents were added. Provisions for step-wise change of radius for NPS $\frac{3}{4}$ long radius elbows and 180 deg returns were introduced. Following Standards Committee, cosecretariat, and ANSI approval, the revision was published as ANSI B16.9-1978. It was updated by a corrective addendum, B16.9a-1981, issued in February 1982.

In 1982, American National Standards Committee B16 was reorganized as an ASME Committee operating under procedures accredited by ANSI. In this Edition, the text has been revised and inch dimensions are established as the standard. Following approval by the Standards Committee and ASME, approval as an American National Standard was given by ANSI on November 12, 1986 with the new designation ASME/ANSI B16.9-1986.

In 1991 the Subcommittee reviewed the document and made a number of revisions. Dimensions for short pattern lap joints were also added to this 1993 Edition of the Standard.

In this 2001 Edition, short radius elbows and returns were added which includes all dimensions and tolerances of ASME B16.28-1994. This Edition also provides metric units as an independent but parallel alternative standard to U.S. Customary units and a Quality System Program Annex.

Requests for interpretation or suggestions for revision should be sent to the Secretary, B16 Committee, The American Society of Mechanical Engineers, Three Park Avenue, New York, NY 10016.

This Standard was approved as an American National Standard on April 6, 2001.

FACTORY-MADE WROUGHT BUTTWELDING FITTINGS

1 SCOPE

1.1 General

This Standard covers overall dimensions, tolerances, ratings, testing, and markings for wrought factory-made buttwelding fittings in sizes NPS ½ through 48 (DN 15 through 1200).

1.2 Special Fittings

Fittings may be made to special dimensions, sizes, shapes, and tolerances by agreement between the manufacturer and the purchaser.

1.3 Fabricated Fittings

Fabricated laterals and other fittings employing circumferential or intersection welds are considered pipe fabrication, and are not within the scope of this Standard.

1.4 Standard Units

The values stated in either metric or U.S. Customary units are to be regarded separately as standard. Within the text, the U.S. Customary units are shown in parentheses. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this Standard.

The designations for pressure rating and size are Class and NPS for both metric and customary dimensioned fittings. The designations PN and DN used in international standards are shown for reference convenience.

1.5 References

1.5.1 Referenced Standards. Standards and specifications adopted by reference in this Standard are shown in Mandatory Appendix II. It is not considered practical to identify the specific edition of each standard and specification in the individual references. Instead, the specific edition reference is identified in Mandatory Appendix II. A product made in conformance with a prior edition of reference standards and in all other respects conforming to this Standard will be considered to be in conformance.

1.5.2 Codes and Regulations. A fitting used under the jurisdiction of the ASME Boiler and Pressure Vessel Code, the ASME Code for Pressure Piping, or a governmental regulation is subject to any limitation of that code or regulation. This includes any maximum temperature limitation, or rule governing the use of a material at low temperature.

1.6 Service Conditions

Criteria for selection of fitting types and materials suitable for particular fluid service are not within the scope of this Standard.

1.7 Welding

Installation welding requirements are outside the scope of this Standard.

1.8 Quality Systems

Nonmandatory requirements relating to the fitting manufacturer's Quality System Program are described in Nonmandatory Appendix A.

1.9 Convention

For the purpose of determining conformance with this Standard, the convention for fixing significant digits where limits, maximum or minimum values, are specified shall be rounded off as defined in ASTM E 29. This requires that an observed or calculated value shall be "rounded off" to the nearest unit in the last right-hand digit used in expressing the limit. Decimal value in the last and tolerances do not imply a particular method of measurement.

2 PRESSURE RATINGS

2.1 Basis of Ratings

The allowable pressure ratings for fittings designed in accordance with this Standard may be calculated as for straight seamless pipe of equivalent material (as shown by comparison of composition and mechanical properties in the respective material specifications) in accordance with the rules established in the applicable

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:46:26 2005

sections of ASME B31, Code for Pressure Piping. For the calculation, applicable data for the pipe size, wall thickness, and material that is equivalent to that of the fitting shall be used. Pipe size, wall thickness (or schedule number), and material identity on the fittings are in lieu of pressure rating markings.

2.2 Design of Fittings

The design of fittings shall be established by mathematical analyses (e.g. ASME B16.49 for bends) contained in nationally recognized pressure vessel or piping codes or at the manufacturer's option by proof testing in accordance with section 9 of this Standard. In order to meet design or manufacturing requirements, it is expected that some portion of formed fittings may have to be thicker than the pipe wall with which the fittings is intended to be used. The mathematical analyses, if used, may take into account such thicker sections. Records of mathematical analysis and/or successful proof test data shall be available at the manufacturer's facility for inspection by the purchaser.

3 SIZE

NPS, followed by a dimensionless number, is the designation for nominal fitting size. NPS is related to the reference nominal diameter, DN, used in international standards. The relationship is, typically, as follows:

DN	15	20	25	32	40	50	65	80	100
NPS	½	¾	1	1¼	1½	2	2½	3	4

NOTE: For NPS>4, the equivalence is: DN=25 (NPS)

4 MARKING

4.1 Standard Marking

Each fitting shall be permanently marked to show the following:

(a) manufacturer's name or trademark.

(b) material identification, either the ASTM or ASME grade designation.

(c) schedule number[1] or nominal wall thickness in mm.

(d) size — the nominal pipe size (NPS) identification number related to the end connections shall be used.

(e) compliance — see para 4.4 for standard and special fitting marking.

(f) A manufacturer may supplement these mandatory markings with others, including a DN size designation, but confusion with the required marking shall be avoided.

4.2 Exceptions

Where the size of the fitting does not permit complete marking, the identification marks may be omitted in reverse of the order presented above.

4.3 Depth of Stamping

Where steel stamps are used, care shall be taken so that the marking is not deep enough or sharp enough to cause cracks or to reduce the wall thickness of the fitting below the minimum allowed.

4.4 Compliance

4.4.1 Standard Fittings. That the fitting was manufactured in conformance with this Standard, including all dimensional requirements, is certified by a prefix "WP" in the material grade designation marking.

4.4.2 Special Fittings. That the fitting was manufactured in conformance with this Standard except that dimensional requirements are as agreed between the purchaser and the manufacturer, is certified by a supplementary suffix to the material grade designation marking as follows:

(a) S9 applies for fittings in accordance with ASTM A 234 and A 403.

(b) S6 applies for fittings in accordance with ASTM A 420.

(c) S8 applies for fittings in accordance with ASTM A 815.

(d) SPLD applies for fittings in accordance with ASTM B 361, B 363, and B 366.

5 MATERIAL

Wrought fittings covered by this Standard shall be in accordance with ASTM A 234, A 403, A 420, A 815, B 361, B 363, B 366 or the corresponding standard listed in Section II of the ASME Boiler and Pressure Vessel Code. The term *wrought* denotes fittings made of pipe, tubing, plate, or forgings. Fittings made from block forgings may only be supplied subject

[1] Schedule number is a dimensionless number that is widely used as a convenient designation for use in ordering pipe and fittings. It is normally associated with a group of standardized pipe wall thickness. Refer to ASME B36.10 and ASME B36.19 for complete details on pipe schedule numbers.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:46:26 2005

agreement between manufacturer and purchaser. Such fittings need not meet the requirements of section 7.

6 FITTINGS DIMENSIONS

6.1 General

This Standard provides for a fixed position for the welding ends with reference to either the center line of the fittings or the overall dimensions. Dimensional requirements for these fittings are to be found in Tables 3 through 12 and Tables I1 through I12 of Mandatory Appendix I.

6.2 Special Dimensions

6.2.1 Fatigue Loading. For applications where fatigue loading is a concern, required minimum dimensions shall be furnished by the purchaser.

6.2.2 Bore Diameter. Bore diameters, away from the ends, are not specified. If special flow path requirements are needed, the bore dimensions shall be specified by the purchaser.

6.2.3 Stub Ends. Service conditions and joint construction often dictate stub end length requirements. Therefore, the purchaser must specify long or short pattern fitting when ordering. (See General Note (c) in Tables 10 and I9.)

7 SURFACE CONTOURS

Where adjacent openings in fittings are not in parallel planes, they shall be joined by a circular arc on the external surfaces. The arc may be terminated in tangents.

8 END PREPARATION

Unless otherwise specified, the details of the welding end preparation shall be in accordance with Table 1. Transitions from the welding bevel to outside surface of the fitting and from the root face to the inside surface of the fitting lying within the maximum envelope shown in Fig. 1 are at the manufacturer's option except as covered in Note (5) of Fig. 1 or unless otherwise specifically ordered.

9 DESIGN PROOF TEST

9.1 Required Tests

Proof tests shall be made as set forth in this Standard when the manufacturer chooses proof testing to qualify the fitting design. Unless otherwise agreed upon between manufacturer and purchaser, the proof test shall be one based on the computed bursting pressure of the fitting and its connecting piping.

9.2 Test Assembly

9.2.1 Representative Components. Fittings that are representative of production and selected for test shall be identified as to material, grade, and lot, including heat treatment. They shall be inspected for dimensional compliance to this Standard.

9.2.2 Other Components. Straight seamless or welded pipe sections whose calculated bursting strength is at least as great as the proof test pressure as calculated in para. 9.3 shall be welded to each end of the fitting to be tested. Any internal misalignment greater than 1.5 mm (0.06 in.) shall be reduced by taper boring at a slope not over 1:3. Length of pipe sections for closures shall be as follows.

(a) Minimum length of pipe shall be one pipe O.D. for NPS 14 (DN 350) and smaller.

(b) Minimum length of pipe shall be one-half pipe O.D. for NPS greater than 14 (DN 350).

9.3 Test Procedure

Test fluid shall be water or other liquid used for hydrostatic testing. Hydrostatic pressure shall be applied to the assembly. The test is successful if the assembly withstands, without rupture, 105% of the computed proof test pressure defined below.

$$P = \frac{2St}{D}$$

where

D = specified outside diameter of pipe

P = computed minimum proof test pressure for fitting

S = actual tensile strength of the test fitting, determined on a specimen representative of the test fitting, which shall meet the tensile strength requirements of the applicable material of section 5.

(a) Plain Bevel **(b) Compound Bevel**

TABLE 1 WELDING BEVELS AND ROOT FACE

Nominal Wall Thickness, *t*	End Preparation
Less than *x* [Note (2)]	Cut square or slightly chamfer, at manufacturer's option. (Not illustrated.)
x to 22 (0.88) included	Plain bevel as in sketch (a) above.
More than 22 (0.88)	Compound bevel as in sketch (b) above.

GENERAL NOTES:
(a) Dimensions in parentheses are in inches.
(b) Other dimensions are in millimeters.

NOTES:
(1) See section 8 and Fig. 1 for transition contours.
(2) x = 5 (0.19) for carbon steel or ferritic alloy steel and 3 (0.12) for austenitic alloy steel.

t = nominal pipe wall thickness of the pipe that the fitting marking identifies

NOTE: Any dimensionally consistent system of units may be used.

9.4 Applicability of Test Results

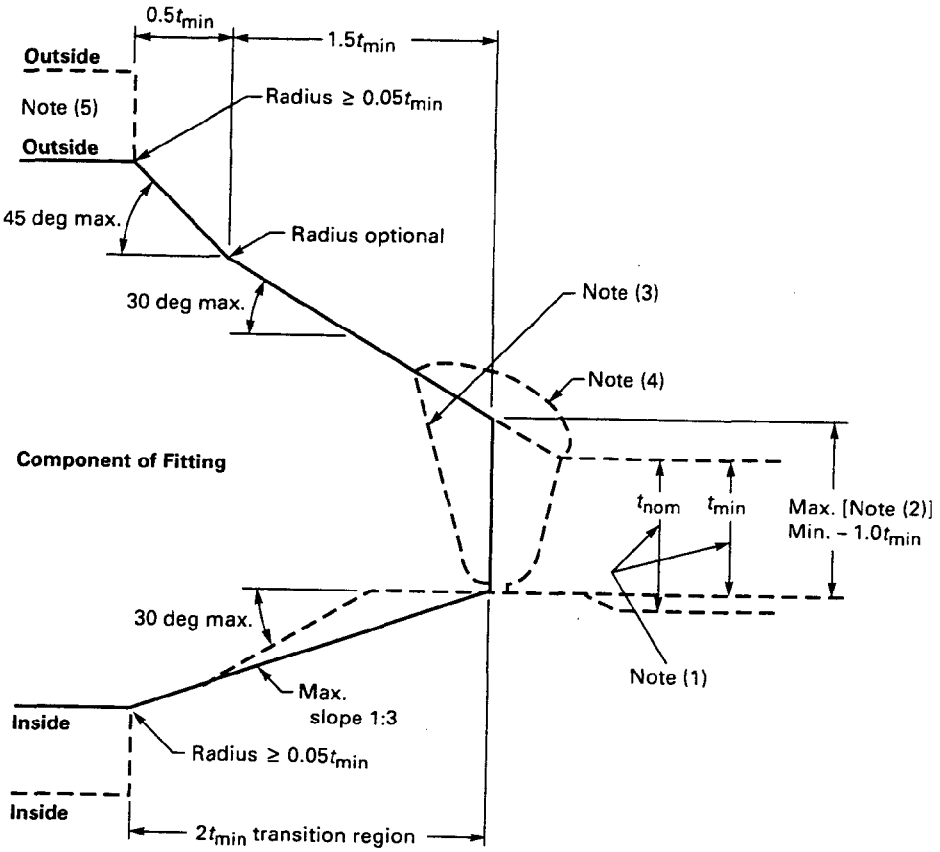
It is not necessary to conduct an individual test of fittings with all combinations of sizes, wall thicknesses, and materials. A successful proof test on one representative fitting may represent others to the extent described in this Standard.

9.4.1 Size Range. One test fitting may be used to qualify similarly proportioned fittings with a size range from one-half to twice that for the tested fitting. The test of a non-reducing fitting qualifies reducing fittings of the same pattern. The test of a reducing fitting qualifies reductions to smaller sizes.

9.4.2 Thickness Range. One test fitting may be used to qualify similarly proportioned fittings with t/D ranges from one-half to three times that for the tested fitting.

9.4.3 Material Grades. The pressure retaining capacity of a geometrically identical fitting made of various grades of steel will be directly proportional to the tensile properties of the various grades; see para 2.1. Therefore, it is necessary to test only a single material grade in a representative fitting to prove the design of the fitting.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:46:27 2005



NOTES:
(1) The value of t_{min} is whichever of the following is applicable:
(a) the minimum ordered wall thickness of the pipe;
(b) 0.875 times the nominal wall thickness of pipe ordered to a pipe schedule wall thickness that has an undertolerance of 12.5%.
(2) The maximum thickness at the end of the component is:
(a) the greater of [t_{min} +4mm (0.16 in.)] or 1.15t_{min} when ordered on a minimum wall basis;
(b) the greater of [t_{min} +4mm (0.16 in.)] or 1.10t_{nom} when ordered on a nominal wall basis.
(3) Weld bevel shown is for illustration only.
(4) The weld reinforcement permitted by applicable code may lie outside the maximum envelope.
(5) Where transitions using maximum slope do not intersect outside surface within the transition region, as shown by phantom outline, maximum slopes shown shall be used. Alternately, radii lying within the envelope may be used.

FIG. 1 MAXIMUM ENVELOPE FOR WELDING END TRANSITIONS

10 PRODUCTION TESTS

Hydrostatic testing of wrought fittings is not required by this Standard. All fittings shall be capable of withstanding, without leakage or impairment of serviceability, a hydrostatic test pressure required by the applicable piping code for seamless pipe of material equivalent to the fitting material and of the size and wall thickness the fitting marking identifies.

11 TOLERANCES

Tolerances for fittings are shown in Tables 2 and I1, and apply to the nominal dimensions given in Tables 3 through 12 and Tables I2 through I11. Where given in the tables, the minimum and maximum dimensions are based on these tolerances. The listings with decimals do not imply precision measurement such as use of vernier, micrometer, electronic readout equipment, etc.

(b) All dimensions are in millimeters.
(c) Tolerances are equal plus and minus except as noted.

NOTES:
(1) Out-of-round is the sum of absolute values of plus and minus tolerances.
(2) This tolerance may not apply in localized areas of formed fittings where increased wall thickness is required to meet design requirements of para. 2.2.
(3) The inside diameter and the nominal wall thicknesses at ends are to be specified by the purchaser.
(4) Unless otherwise specified by the purchaser, these tolerances apply to the nominal inside diameter, which equals the difference between the nominal outside diameter and twice the nominal wall thickness.

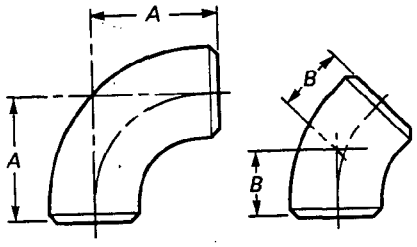

TABLE 3 DIMENSIONS OF LONG RADIUS ELBOWS

Nominal Pipe Size (NPS)	DN	Outside Diameter at Bevel	Center-to-End	
			90 Deg Elbows, *A*	45 Deg Elbows, *B*
½	15	21.3	38	16
¾	20 [Note (1)]	26.7	38	19

24	600	616	609	305	152	13	692

GENERAL NOTES:

(a) All dimensions are in millimeters.

(b) See Table 2 for tolerances.

(c) Service conditions and joint construction often dictate stub end length requirements. Therefore, the purchaser must specify long or short pattern fitting when ordering.

NOTES:

(1) Gasket face finish shall be in accordance with ASME B16.5 for raised face flanges.

(2) The lap thickness *T* shall not be less than nominal pipe wall thickness. See Table 2 for maximum tolerance.

(3) When short pattern stub ends are used with larger flanges in Classes 300 and 600, (PN50 & PN110) and with most sizes in Classes 900 (PN150) and higher, and when long pattern stub ends are used with larger flanges in Classes 1500 and 2500, (PN260 AND PN420) it may be necessary to increase the length of the stub ends in order to avoid covering the weld with the flange. Such increases in length shall be a matter of agreement between the manufacturer and purchaser.

(4) When special facings such as tongue and groove, male and female, etc., are employed, additional lap thickness must be provided and such additional thickness shall be in addition to (not included in) the basic length *F*.

(5) These dimensions conform to the radius established for lap joint flanges in ASME B16.5, Pipe Flanges and Flanged Fittings.

(6) This dimension conforms to standard machined facings shown in ASME B16.5. The back face of the lap shall be machined to conform to the surface on which it seats. Where ring joint facings are to be applied, use dimension *K* as given in ASME B16.5.

GENERAL NOTES:
(a) All dimensions are in millimeters.
(b) The shape of these caps shall be elipsoidal and shall conform to the shape requirements as given in the ASME Boiler and Pressure Vessel Code.

NOTES:
(1) Length *E* applies for thickness not exceeding that given in column "Limiting Wall Thickness for Length *E*."
(2) Length E_1 applies for thickness greater than that given in column "Limiting Wall Thickness" for NPS 24 (DN 600) and smaller. For NPS 26 (DN 65) and larger, length E_1 shall be by agreement between manufacturer and purchaser.

GENERAL NOTES:
(a) For reference, see Table I1 Illustration beginning on page 22.
(b) All dimensions are in inches. Tolerances are equal plus and minus except as noted.

NOTES:
(1) Out-of-round is the sum of absolute values of plus and minus tolerance.
(2) This tolerance may not apply in localized areas of formed fittings where increased wall thickness is required to meet design requirements of para. 2.2.
(3) The inside diameter and the nominal wall thicknesses at ends are to be specified by the purchaser.
(4) Unless otherwise specified by the purchaser, these tolerances apply to the nominal inside diameter, which equals the difference between the nominal outside diameter and twice the nominal wall thickness.

TABLE I4 DIMENSIONS OF LONG RADIUS RETURNS

Nominal Pipe Size (NPS)	Outside Diameter at Bevel	Center-to-Center, *O*	Back-to-Face, *K*
½	0.84	3.00	1.88
¾ [Note (3)]	1.05	3.00	2.00
1	1.32	3.00	2.19
1¼	1.66	3.75	2.75
1½	1.90	4.50	3.25
2	2.38	6.00	4.19
2½	2.88	7.50	5.19
3	3.50	9.00	6.25
3½	4.00	10.50	7.25
4	4.50	12.00	8.25
5	5.56	15.00	10.31
6	6.62	18.00	12.31
8	8.62	24.00	16.31
10	10.75	30.00	20.38
12	12.75	36.00	24.38
14	14.00	42.00	28.00
16	16.00	48.00	32.00
18	18.00	54.00	36.00
20	20.00	60.00	40.00
22	22.00	66.00	44.00
24	24.00	72.00	48.00

GENERAL NOTE: All dimensions are in inches.

NOTES:
(1) See Table I1 for tolerance for alignment of ends, *U*.
(2) Dimension *A* is equal to one-half of dimension *O*.
(3) *O* and *K* dimensions of 2.25 in. and 1.69 in. respectively, may be furnished for NPS ¾ at the manufacturer's option.

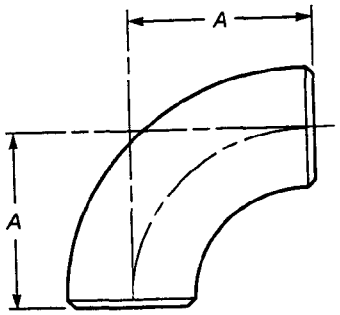

TABLE I5 DIMENSIONS OF SHORT RADIUS ELBOWS

Nominal Pipe Size	Outside Diameter at Bevel	Cent to-End, *A*
1	1.32	1.00
1¼	1.66	1.25
1½	1.90	1.50

22	22.240	21.969	12.00	6.00	0.50	25.25
24	24.240	23.969	12.00	6.00	0.50	27.25

GENERAL NOTES:

(a) All dimensions are in inches.

(b) See Table I1 for tolerances.

(c) Service conditions and joint construction often dictate stub end length requirements. Therefore, the purchaser must specify long or short pattern fitting when ordering.

NOTES:

(1) Gasket face finish shall be in accordance with ASME B16.5 for raised face flanges.

(2) The lap thickness *T* shall not be less than nominal pipe wall thickness. See Table I1 for tolerance.

(3) When short pattern stub ends are used with larger flanges in Classes 300 and 600, and with most sizes in Classes 900 and higher, and when long pattern stub ends are used with larger flanges in Classes 1500 and 2500, it may be necessary to increase the length of the stub ends in order to avoid covering the weld with the flange. Such increases in length shall be a matter of agreement between the manufacturer and the purchaser.

(4) When special facings such as tongue and groove, male and female, etc., are employed, additional lap thickness must be provided and such additional thickness shall be in addition to (not included in) the basic length *F*.

(5) These dimensions conform to the radius established for lap joint flanges in ASME B16.5, Pipe Flanges and Flanged Fittings.

(6) This dimension conforms to standard machine facings shown in ASME B16.5. The back face of the lap shall be machined to conform to the surface on which it seats. Where ring joint facings are to be applied, use dimension *K* as given in ASME B16.5.

16	16.00	7.00	0.50	8.00					

GENERAL NOTES:
(a) All dimensions are in inches.
(b) The shape of these caps shall be ellipsoidal and shall conform to the shape requirements asgiven in the ASME Boiler and Pressure Vessel Code.

NOTES:
(1) Length E applies for thickness not exceeding that given in column "Limiting Wall Thickness for Length E."
(2) Length E_1 applies for thickness greater than that given in column "Limiting Wall Thickness" for NPS 24 and smaller. For NPS 26 and larger, length E_1 shall be by agreement between the manufacturer and purchaser.

NONMANDATORY APPENDIX A
QUALITY SYSTEM PROGRAM

The products manufactured in accordance with this Standard shall be produced under a quality system program following the principles of an appropriate standard from the ISO 9000 series[1]. A determination of the need for registration and/or certification of the product manufacturer's quality system by an independent organization shall be the responsibility of the manufacturer. The detailed documentation demonstrating program compliance shall be available to the purchaser at the manufacturer's facility. A written summary description of the program utilized by the product manufacturer shall be available to the purchaser upon request. The product manufacturer is defined as the entity whose name or trademark appears on the product in accordance with the marking or identification requirements of this Standard.

---

[1] The series is also available from the American National Standards Institute (ANSI) and the American Society for Quality Control (ASQC) as American National Standards that are identified by a prefix "Q" replacing the prefix "ISO". Each standard of the series is listed under references.

ADOPTION NOTICE

ASME-B16.11, "Fittings, Steel Forged, Socket-Welding and Threaded," was adopted on October 3, 1994 for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Commanding Officer, Naval Construction Battalion Center, Code 156, 1000 23rd Avenue, Port Hueneme, CA 93043-4301. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from the American Society of Mechanical Engineers, 345 East 47th Street, New York, NY 10017.

Date of Issuance: April 16, 1997

The 1996 edition of this Standard is being issued with an automatic addenda subscription service. The use of an addenda allows revisions made in response to public review comments or committee actions to be published as necessary; revisions published in addenda will become effective 6 months after the Date of Issuance of the addenda. The next edition of this Standard is scheduled for publication in 2001.

ASME issues written replies to inquiries concerning interpretations of technical aspects of this Standard. The interpretations will be included with the above addenda service. Interpretations are not part of the addenda to the Standard.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

(This Foreword is not part of ASME B16.11-1996.)

The Sectional Committee on the Standardization of Pipe Flanges and Fittings, B16, organized in 1920 under the procedure of the American Standards Association (ASA) appointed a subgroup of Subcommittee No. 3 (now Subcommittee F) to initiate the standardization of welding fittings in May, 1937. The first meeting of this group was held later that month, and at its meeting in December, 1938, in New York, it was agreed to undertake the standardization of dimensions of socket-welding fittings and to refer this project to a new drafting subgroup. One of the most important dimensions of this type of fitting requiring standardization was considered to be the dimension from the centerline of the fitting to the bottom of the socket, since from the stand-point of the designing engineer, this dimension governs the location of adjacent pipe with reference to the entire piping layout. Another important item for consideration was the welding fillet dimensions.

The drafting subgroup held meetings in Chicago, Detroit, and New York in March, 1939, and May and October, 1940, respectively, and at the last named meeting the completed draft of the proposed standard was discussed and further revisions were suggested. When applied to the September, 1940, draft, these changes produced the May, 1941, draft which was prepared for distribution to industry for criticism and comment.

This distribution resulted in a number of helpful comments. The members of the subgroup agreed by mail that many of the changes suggested should be incorporated in the revised draft (December, 1941). Progress on the approval of the standard was delayed by the war after which a few more changes were added to make the proposal acceptable to all concerned. The revised draft (April, 1946) was then submitted to the members of the sectional committee for letter ballot vote.

Following the approval of the sectional committee, the proposed standard was next approved by the sponsor bodies, and presented to the ASA with recommendation for approval as an American Standard. This designation was given on December 9, 1946.

In 1960, it was agreed that the standard needed a complete revision and simultaneously that it should be expanded to cover threaded fittings and plugs, then covered by MSS SP-49 and SP-50. A Task Force worked diligently for four years before arriving at a draft which it felt was acceptable. They also found that ratings were outdated and eliminated the 4000 lb classes of threaded fittings, assigned pressure-temperature ratings for a number of materials, and converted the socket weld fitting ratings to 3000 and 6000 lb. Following approval by the Sectional Committee and Sponsors, ASA approval was granted on January 28, 1966.

Following designation changes of ASA to ANSI and Sectional Committee to Standards Committee, Subcommittee No. 6 began consideration of changes in 1969. Early in 1972, changes in the pressure class designations, materials, and clarification of wording were agreed upon and submitted for approval. This approach was granted on June 20, 1973.

The work of development of the 1980 edition of B16.11 began in 1975 when the committee began consideration of comments and proposals for change, which had been received. The development procedure was arduous in that a number of ballots were taken which elicited many additional comments and counter proposals. The major changes included

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:47:24 2005

an expanded scope for better definition, requirements for conformance marking, a nonmandatory annex with provisions for proof or burst testing and the inclusion of metric equivalents. Following approval by the Standards Committee and Co-Secretariat, final approval by ANSI was granted on October 6, 1980.

In 1982, American National Standards Committee B16 was reorganized as an ASME Committee operating under procedures accredited by ANSI. The 1991 edition of the standard, re-titled "Forged Fittings, Socket-Welding and Threaded," incorporated forging material listed in Table 1 of ASME/ANSI B16.34-1988, including Group 3 material which was not previously covered in B16.11. The 1991 edition established U.S. customary units as the standard. Other clarifying and editorial revisions were made in order to improve the text. Following approval by the Standards Committee and ASME, final approval by ANSI was granted on March 4, 1991.

In this 1996 Edition, metric dimensions were added as an independent but equal standard to the inch units. Following approval by the Standards Committee and ASME, this revision to the 1991 edition of this Standard was approved as an American National Standard by ANSI on December 16, 1996, with the new deSignation ASME B16.11-1996.

All requests for interpretations or suggestions for revisions should be sent to the Secretary, B16 Committee, The American Society of Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, NY 10017.

FORGED FITTINGS, SOCKET-WELDING AND THREADED

1 SCOPE

1.1 General

This Standard covers ratings, dimensions, tolerances, marking and material requirements for forged fittings, both socket-welding and threaded, as illustrated in Tables 4 through 7 and A4 through A7, inclusive.

1.1.1 Fitting Types/Configuration. Types of fittings covered by this Standard are shown in Tables 1A and 1B, by class and size range. Fittings shown in Tables 4 through 7 and A4 through A7 may also be made with combinations of socket-welding and threaded ends.

1.1.2 Partial Compliance Fittings. Fittings with special dimensions, threads or counterbores, and fittings made from nonstandard materials may be made by agreement between the manufacturer and the purchaser (see para. 5.2). When such fittings meet all other stipulations of this Standard, they shall be considered in partial compliance therewith, provided they are appropriately marked (see para. 4).

1.1.3 Quality Systems. Nonmandatory requirements relating to the product manufacturer's Quality System Program are described in Annex C.

1.2 References

1.2.1 Referenced Standards. Standards and specifications adopted by reference in this Standard are shown in Annex D, which is part of this Standard. It is not considered practical to identify the specific edition of each standard and specification in the individual references. Instead, the specific edition reference is identified in Annex D. A fitting made in conformance and conforming to this Standard, in all other respects, will be considered to be in conformance to the Standard, even though the edition reference may be changed in a subsequent addendum to or revision of the Standard.

1.2.2 Codes and Regulations. A fitting used under the jurisdiction of the ASME Boiler and Pressure Vessel Code, the ASME Code for Pressure Piping, or a governmental regulation is subject to any limitation of that code or regulation. This includes any maximum temperature limitation, or rule governing the use of a material at low temperature, or provisions for operation at a pressure exceeding the ratings in this Standard.

1.3 Service Conditions

Criteria for selection of fitting types and materials suitable for particular fluid service are not within the scope of this Standard.

1.4 Welding

Installation welding requirements are not within the scope of this Standard. Installation welding shall be done in accordance with the applicable piping Code or regulation covering the piping system into which the fittings are installed.

1.5 Standard Units

The values stated in either metric units or inch units are to be regarded separately as standard. Within the text, the inch units are shown in parentheses. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the standard.

Tables 4 through 7 show fittings dimensional requirements in millimeters. Tables A4 through A7 show the dimensional requirements for inch dimensioned fittings.

2 PRESSURE RATINGS

2.1 General

These fittings shall be designated as Class 2000, 3000, and 6000 for threaded end fittings and Class 3000, 6000, and 9000 for socket-weld end fittings.

2.1.1 Basis of Rating. The schedule of pipe corresponding to each Class of fitting for rating purposes is shown in Table 2. Design temperature and other service conditions shall be limited as provided by the applicable piping code or regulation for the material of construction of the fitting. Within these limits the maximum allowable pressure of a fitting shall be that computed for straight seamless pipe of equivalent material (as shown by comparison of composition and mechanical properties in the respective material specifications). The wall thickness used in such computation shall be that tabu-

TABLE 1A TYPES OF FITTINGS BY CLASS DESIGNATION AND DN (NOMINAL SIZE) RANGE

Description	Socket-Weld			Threaded		
	Class Designation			Class Designation		
	3000	6000	9000	2000	3000	6000
45 deg., 90 deg. Elbows	DN6-DN100	DN6-DN50	DN15-DN50	DN6-DN100	DN6-DN100	DN6-DN100
Tees, Crosses	DN6-DN100	DN6-DN50	DN15-DN50	DN6-DN100	DN6-DN100	DN6-DN100
Coupling, Half-Coupling	DN6-DN100	DN6-DN50	DN15-DN50	...	DN6-DN100	DN6-DN100
Cap	DN6-DN100	DN6-DN100	DN15-DN50	...	DN6-DN100	DN6-DN100
Square, Hex, Round Plug	...	...	...	DN6-DN100 [See Note (1)]		
Hex and Flush Bushing	...	...	...	DN6-DN100 [See Note (1)]		

NOTE:
(1) Plugs and bushings are not identified by Class Designation. They may be used for ratings up through Class 6000 designation.

TABLE 1B TYPES OF FITTINGS BY CLASS DESIGNATION AND NPS SIZE RANGE

Description	Socket-Weld			Threaded		
	Class Designation			Class Designation		
	3000	6000	9000	2000	3000	6000
45 deg., 90 deg. Elbows	1/8-4	1/8-2	1/2-2	1/8-4	1/8-4	1/8-4
Tees, Crosses	1/8-4	1/8-2	1/2-2	1/8-4	1/8-4	1/8-4
Coupling, Half-Coupling	1/8-4	1/8-2	1/2-2	...	1/8-4	1/8-4
Cap	1/8-4	1/8-4	1/2-2	...	1/8-4	1/8-4
Square, Hex, Round Plug	...	...	...	1/8-4 [See Note (1)]		
Hex and Flush Bushing	...	...	...	1/8-4 [See Note (1)]		

NOTE:
(1) Plugs and bushings are not identified by Class Designation. They may be used for ratings up through Class 6000 designation.

lated in ANSI/ASME B36.10M for the size and applicable schedule of pipe reduced by applicable manufacturing tolerances and other allowances (e.g., threaded allowances).

Any corrosion allowance and any variation in allowable stress due to temperature or other design shall be applied to the pipe and fitting alike.

2.1.2 Nonstandard Pipe Wall Thickness. Since ANSI/ASME B36.10M does not include Schedule 160 nor Double Extra Strong thickness for DN6, 8, and 10 (NPS 1/8, 1/4, and 3/8), the values in Table 3 may be used as the nominal wall thicknesses of the pipe for rating purposes.

2.1.3 Combination End Fittings. The Class for fittings made with combinations of socket-welding and threaded ends shall be based on the end configuration that has the lowest rating from Table 2.

2.2 Pressure Test Capability

Pressure testing is not required by this Standard but the fittings shall be capable of withstanding a hydrostatic test pressure required by the applicable piping code for seamless pipe of material equivalent to the fitting forging and of the schedule or wall thickness correlated with the fitting Class and end connection of Table 2.

3 SIZE AND TYPE

3.1 General

The following table shows nominal pipe size (NPS) used for inch dimensioned fittings versus nominal diameter (DN), used for millimeter dimensioned fittings.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:47:25 2005

NPS VERSUS DN

NPS	1/8	1/4	3/8	1/2	3/4	1
DN	6	8	10	15	20	25

NPS	1 1/4	1 1/2	2	2 1/2	3	4
DN	32	40	50	65	80	100

3.2 Reducing Fitting Size

In the case of reducing tees and crosses, the size of the largest run opening shall be given first, followed by the size of the opening at the opposite end of the run. Where the fitting is a tee, the size of the branch is given last. Where the fitting is a cross, the largest side-outlet is the third dimension given, followed by the opening opposite. The line sketches, Fig. 1, illustrate how the reducing fittings are read.

4 MARKING

4.1 General

Each fitting shall be permanently marked with the required identification by raised lettering and/or by stamping, electro-etching, or vibro-tool marking on the collar portion, raised pad or raised boss portion of the forging. Cylindrical fittings shall be marked on the O.D. or on the end of the fitting in a location such that the marking will not be obliterated as a result of welding installation. The marking of bushings and plugs is not required by this Standard.

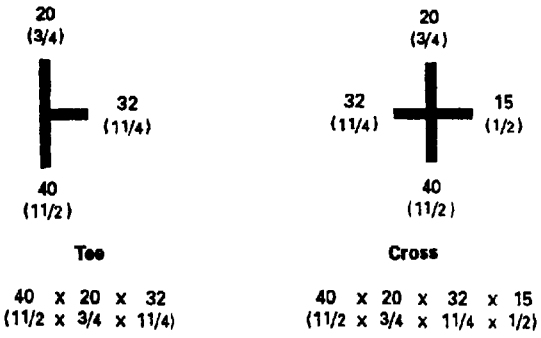

FIG. 1 METHOD OF DESIGNATING OUTLETS OF REDUCING TEES AND CROSSES (See para. 3.2)

TABLE 2 CORRELATION OF FITTINGS CLASS WITH SCHEDULE NUMBER OR WALL DESIGNATION OF PIPE FOR CALCULATION OF RATINGS

Class Designation of Fitting	Type of Fitting	Pipe Used For Rating Basis [Note (1)]	
		Schedule No.	Wall Designation
2000	Threaded	80	XS
3000	Threaded	160	...
6000	Threaded	...	XXS
3000	Socket-Welding	80	XS
6000	Socket-Welding	160	...
9000	Socket-Welding	...	XXS

NOTE:
(1) This table is not intended to restrict the use of pipe of thinner or thicker wall with fittings. Pipe actually used may be thinner or thicker in nominal wall than that shown in Table 2. When thinner pipe is used, its strength may govern the rating. When thicker pipe is used (e.g., for mechanical strength), the strength of the fitting governs the rating.

TABLE 3 NOMINAL WALL THICKNESS OF SCHEDULE 160 AND DOUBLE EXTRA STRONG PIPE

DN	NPS	Schedule 160		XXS	
		mm	in.	mm	in.
6	1/8	3.15	0.124	4.83	0.190
8	1/4	3.68	0.145	6.05	0.238
10	3/8	4.01	0.158	6.40	0.252

4.1.1 Specific Marking. The marking shall include (but is not limited to) the following:

(a) Manufacturer's Name or Trademark

(b) Material Identification. Material shall be identified in accordance with the marking requirements of either the appropriate ASTM Fittings Specifications A 234, A 403, A 420, or B 366, or the appropriate ASTM Forging Specifications A 105, A 182, A 350 B 160, B 164, or other applicable forging Specification of Table 1, ASME/ANSI B16.34 (see para. 5.1).

(c) Product Conformance. Fittings covered under para. 1.1.1 shall be marked with either the ASTM Fittings Specification material identification (e.g.,

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:47:26 2005

"WP ____") or the symbol "B16" to denote conformance to this Standard.

Partial compliance fittings covered in para. 1.1.2 marked with ASTM forging identification (A 105, A 182, A 350, etc.) shall not be marked B16.

Partial compliance fittings covered in para. 1.1.2 marked with ASTM Fitting Specification (A 234, A 403, A 420, and B 366) shall be marked with the number of the applicable ASTM Specification Supplementary Requirement covering special or nonstandard fittings.

(d) Class Designation. 2000, 3000, 6000, or 9000, as applicable. Alternatively, the designation 2M, 3M, 6M, or 9M, as applicable, may be used where M stands for 1000.

(e) Size. The nominal pipe size related to the end connections.

4.1.2 Omission of Markings. Where size and shape of fittings do not permit all of the above markings, they may be omitted in the reverse order given above.

5 MATERIAL

5.1 Standard Materials

The material for fittings shall consist of forgings, bars, seamless pipe, or tubular products which conform to the requirements for melting process, chemical composition requirements, and mechanical property requirements of the forging product form listed in Table 1, ASME B16.34, including notes.

5.2 Nonstandard Materials

When fittings made of other materials reference this Standard for nonstandard coverage, they should be marked as agreed upon by manufacturer and purchaser, and shall not include the identification specified in paras. 4.1.1(b) and 4.1.1(c) of this Standard (see Annex B).

6 DIMENSIONS

6.1 General

Unless otherwise noted, the dimensions for socket-welding fittings given in Tables 4 and A4 and the dimensions for threaded fittings given in Tables 5, 6, 7, A5, A6, and A7 are nominal values and subject to the designated manufacturing tolerance.

6.2 Socket Fittings

6.2.1 Body Wall Thickness. The body wall thickness of socket-welding fittings shall be equal to or greater than the values, G, shown in Tables 4 and A4.

6.2.2 Socket Wall Thickness. The socket wall average thickness and minimum thickness shall be no less than the corresponding values, C, shown in Tables 4 and A4.

6.2.3 Socket Position. The fixed position for the bottom of the socket with reference to the centerline of the socket-welding fitting shall be maintained as required by the dimensions, A, of Tables 4 and A4. For reducing fittings, see para. 6.5.

6.2.4 Socket Depth. The socket depth shall be no less than the minimum values, J, shown in Tables 4 and A4.

6.2.5 Socket Bore. The inside surface of the socket bore shall present a good workmanlike finish that is free of burrs.

6.2.6 Perpendicularity. The end flats of socket-welding fittings shall be at right angles to the socket axis.

6.2.7 Width. The forging radius shall not reduce the width of the flat welding surface to less than the value shown in Fig. 2.

6.3 Threaded Fittings

6.3.1 Wall Thickness. The body or end wall thickness of threaded fittings shall be equal to or greater than the minimum values, G, as shown in Tables 5, A5, or A6.

6.3.2 Internal Threading. All fittings with internal threads shall be threaded with American National Standard Taper Pipe Threads (ANSI/ASME B1.20.1). Variations in threading shall be limited to one turn large or one turn small from the gaging notch when using working gages. The reference point for gaging is the starting end of the fitting, providing the chamfer does not exceed the major diameter of the internal thread. When a chamfer on the internal thread exceeds this limit, the reference point becomes the last thread scratch on the chamfer cone.

6.3.3 External Threads. All externally threaded fittings shall be threaded with American National Standard Taper Pipe Threads (ANSI/ASME B1.20.1) and the variation in threading shall be limited to one turn large or one turn small from the gage face of ring

Wed Feb 02 00:47:26 2005

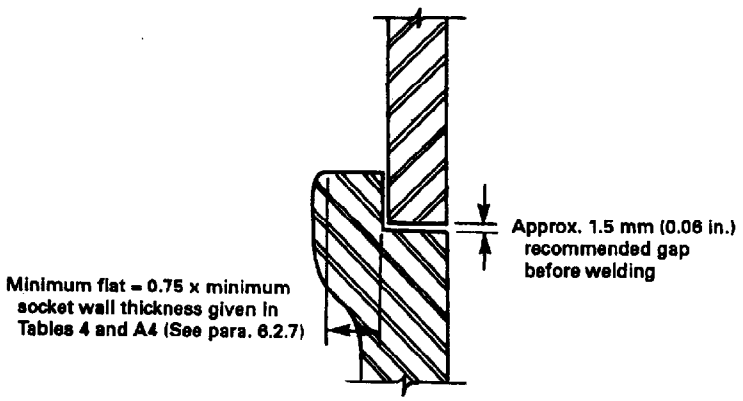

FIG. 2 WELDING GAP AND MINIMUM FLAT DIMENSIONS FOR SOCKET-WELDING FITTINGS

when using working gages. The reference point for gaging is the end of the thread.

6.3.4 Countersink or Chamfer. All internal threads shall be countersunk a distance not less than one-half the pitch of the thread at an angle of approximately 45 deg. with the axis of the thread, and all external threads shall be chamfered at an angle of 30 deg. to 45 deg. from the axis, for the purpose of easier entrance in making a joint and for protection of the thread. Countersinking and chamfering shall be concentric with the threads. The length of threads specified in all tables shall be measured to include the countersink or chamfer.

6.4 Collars

End collars of both socket-welding and threaded fittings shall be such that they overlap the crotch area as illustrated in the sketches in Tables 4, A4, and A5.

6.5 Reducing Fittings

Reducing fittings shall have the same center-to-end, center-to-bottom of socket, band diameter, and outside diameters as the uniform size fitting corresponding to the largest size end connection of the reducing fitting.

7 TOLERANCES

7.1 Additional Tolerances

Tolerances in addition to those listed in Tables 4, 5, 6, 7, A4, A5, A6, and A7.

7.1.1 Concentricity of Bores. The socket and fitting bores shall be concentric within a tolerance of 0.8 mm (0.03 in.) for all sizes. Opposite socket bores shall be concentric within a tolerance of 1.5 mm (0.06 in.) for all sizes.

7.1.2 Coincidence of Axes. The maximum allowable variation in the alignment of the fitting bore and socket bore axes shall be 1.0 mm in 200 mm (0.06 in. in 1 ft). The maximum allowable variation in alignment of threads shall be 1.0 mm in 200 mm (0.06 in. in 1 ft).

8 TESTING

8.1 Proof Testing

Proof testing for fittings made from standard materials is not required by this Standard.

ANNEX B
METHOD FOR BURST TESTING FITTINGS

(This Annex is an integral part of ASME B16.11-1996 and is placed after the main text for convenience. See para. 5.2.)

B1 This Annex is included to provide documentation of design requirements for nonstandard materials as a service to users of this Standard (see para. 5.2).

B2 Such fittings whose design cannot be established by mathematical analyses contained in nationally recognized pressure vessel or piping codes may be established by proof testing in accordance with Section B3.

B3 To insure adequacy of fittings design, the actual bursting strength of fittings shall not be less than the computed bursting strength of the pipe of the designated schedule number and material. To determine the relative strength of the fitting, straight pipe of the designated wall thickness and material shall be welded to each end of the socket-welding fitting or threaded into each end of the threaded end fitting, 153 mm (6.0 in.) in length but not less than twice the outside diameter of the pipe, and with proper end closures applied beyond the minimum length of straight pipe. Hydrostatic pressure shall be applied until at least the computer bursting pressure is achieved.

The computed bursting strength of pipe shall be determined on the basis of the following formula:

$$P = \frac{2SFt}{D}$$

where

P = computed bursting strength of pipe gage pressure

S = specification minimum ultimate tensile strength of pipe material

F = 1.125, which is a factor to adjust test pressure for the actual tensile strength of the test piece

t = pipe wall thickness
= 0.90 × nominal thickness in sizes DN 32 (1¼ in.) and less
= 0.93 × nominal thickness in sizes DN 40 (1½ in.) and larger

D = outside diameter of pipe

(NOTE: Any dimensionally consistent system may be used.)

Since the above formula is applicable only to straight pipe it cannot be used for a direct computation of the bursting strength of fittings. The fittings ability to withstand bursting shall be gaged only by comparing their behavior on test with the calculated bursting strength of straight pipe of the designated wall thickness and material.

ANNEX C
QUALITY SYSTEM PROGRAM

(This Annex is not a part of ASME B16.11-1996 and is included for information purposes only.)

The products manufactured in accordance with this Standard shall be produced under a quality system program following the principles of an appropriate standard from the ISO 9000 series[1]. A determination of the need for registration and/or certification of the product manufacturer's quality system program by an independent organization shall be the responsibility of the manufacturer. The detailed documentation demonstrating program compliance shall be available to the purchaser at the manufacturer's facility. A written summary description of the program utilized by the product manufacturer shall be available to the purchaser upon request. The product manufacturer is defined as the entity whose name or trademark appears on the product in accordance with the marking or identification requirements of this Standard.

---

[1] The series is also available from the American National Standards Institute (ANSI) and the American Society for Quality Control (ASQC) as American National Standards that are identified by a prefix "Q" replacing the prefix "ISO". Each standard of the series is listed under references.

Date of Issuance: July 21, 2000

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

ASME B16.20a-2000

Following approval by the ASME B16 Committee and ASME, and after public review, ASME B16.20a-2000 was approved by the American National Standards Institute on May 3, 2000.

Addenda to the 1998 edition of ASME B16.20 are issued in the form of replacement pages. Revisions, additions, and deletions are incorporated directly into the affected pages. It is advisable, however, that this page, the Addenda title and copyright pages, and all replaced pages be retained for reference.

SUMMARY OF CHANGES

This is the first Addenda to be published to ASME B16.20-1998.

Replace or insert the pages listed. Changes given below are identified on the pages by a margin note, **(a)**, placed next to the affected area. The pages not listed are the reverse sides of the listed pages and contain no changes.

ASME B16 COMMITTEE (a)
Standardization of Valves, Flanges, Fittings, Gaskets, and Valve Actuators

(The following is the roster of the Committee at the time of approval of this Standard.)

OFFICERS

W. N. McLean, *Chair*
H. R. Sonderegger, *Vice Chair*
P. A. Reddington, *Secretary*

COMMITTEE PERSONNEL

W. L. Ballis, Consultant, London, Ohio
R. W. Barnes, Anric Enterprises, Etobicoke, Ontario, Canada
R. R. Brodin, Fisher Controls International, Inc., Marshalltown, Iowa
M. A. Clark, Nibco, Inc., Elkhart, Indiana
A. Cohen, A. Cohen and Associates, Albuquerque, New Mexico
C. E. Floren, Mueller Co., Decatur, Illinois
D. R. Frikken, Solutia, Inc., St. Louis, Missouri
R. Henrich, Minnegasco, Inc., Golden Valley, Minnesota
J. C. Inch, Mueller Refrigeration Products Co., Hartsville, Tennessee
G. A. Jolly, Vogt Valve Co., Louisville, Kentucky
W. G. Knecht, BW/IP International, Inc., Williamsport, Pennsylvania
R. Koester, The William Powell Co., Cincinnati, Ohio
W. N. McLean, Newco Valves, Palos Park, Illinois
M. L. Nayyar, Bechtel Power Corp., Gaithersburg, Maryland
P. A. Reddington, American Society of Mechanical Engineers, New York, New York
R. A. Schmidt, Trinity-Ladish Co., Russellville, Arkansas
H. R. Sonderegger, Grinnell Corp., Cranston, Rhode Island
W. M. Stephan, Flexitallic, Inc., Mount Laurel, New Jersey
T. F. Stroud, Ductile Iron Pipe Research Association, Birmingham, Alabama
M. D. Wasicek, ABS Americas, Houston, Texas
R. E. White, Richard E. White and Associates, South Bend, Indiana
D. A. Williams, Southern Company Services, Birmingham, Alabama
L. A. Willis, The Dow Chemical Co., Freeport, Texas
W. R. Worley, Union Carbide Corp., South Charleston, West Virginia

SUBCOMMITTEE G — GASKETS FOR FLANGED JOINTS

METALLIC GASKETS FOR PIPE FLANGES

Ring-Joint, Spiral-Wound, and Jacketed

1 SCOPE

1.1 General

This Standard covers materials, dimensions, tolerances, and markings for metal ring joint gaskets, spiral-wound metal gaskets, metal-jacketed gaskets, and filler material. These gaskets are dimensionally suitable for use with flanges described in reference flange standards ASME B16.5, ASME B16.47, and API Specification 6A. This Standard covers spiral-wound metal gaskets and metal-jacketed gaskets for use with raised-face and flat-face flanges.

1.2 Quality Systems

Requirements relating to the product manufacturers' quality system programs are described in Annex A.

1.3 References

Standards and specifications adopted by reference in this Standard are shown in Annex I, which is part of this Standard.

2 RING-JOINT GASKETS

2.1 Types

Ring-joint gaskets shall be either octagonal or oval in cross section.

2.2 Size

Ring-joint gaskets shall be identified by an R, RX, or BX number that relates to flange size (NPS), pressure class, and the appropriate flange standards (ASME B16.5, ASME B16.47, or API Specification 6A).

2.3 Materials

2.3.1 General. Ring-joint gasket materials, some of which are listed in Table 1, shall be selected by the user based on suitability for the service conditions.

TABLE 1 MAXIMUM HARDNESS FOR RING GASKETS

Ring Gasket Material	Maximum Hardness	
	Brinell	Rockwell "B" Scale
Soft iron (1)	90	56
Low-carbon steel	120	68
4–6 chrome ½Mo	130	72
Type 410	170	86
Type 304	160	83
Type 316	160	83
Type 347	160	83

NOTE:
(1) May be low-carbon steel, not to exceed maximum hardness of 90 Brinell—56 Rockwell "B."

It is recommended that ring-joint gaskets be of a lesser hardness than that of the mating flanges.

2.3.2 Hardness. Ring-joint gaskets of materials listed in Table 1 shall have a hardness equal to or less than that shown in Table 1.

2.4 Marking

The outer surface of each gasket shall carry the manufacturer's name or identification trademark and gasket number prefixed by the letters R, RX, or BX followed by the gasket material identification. Materials shall be identified as shown in Table 2. The gasket shall also be marked with an ASME B16.20 designation. The marking shall be applied so as not to harmfully distort the gasket or affect the integrity of the seal.

2.5 Dimensions and Tolerances

Dimensions and tolerances for ring-joint gaskets shall be as shown in Tables 3 through 8.

2.6 Surface Finish

Types R and RX gaskets shall have a finish not rougher than 63 μin. roughness. Type BX gaskets shall have a finish not rougher than 32 μin. roughness. Surface finishes shall pertain to the gasket-sealing surfaces.

TABLE 2 RING GASKET MARKINGS

Ring Gasket Material	Identification	Marking Example (1)
Soft iron (2)	D	R51D
Low-carbon steel	S	R51S
4–6 chrome ½Mo	F5 (3)	R51F5
Type 410	S 410	R51S410
Type 304	S 304	R51S304
Type 316	S 316	R51S316
Type 347	S 347	R51S347

NOTES:
(1) This number shall be preceded by the manufacturer's name or identification trademark.
(2) May be low-carbon steel, not to exceed maximum hardness of 90 Brinell—56 Rockwell "B."
(3) F5 identification designates ASTM Specification A 182-72 chemical composition requirements only.

2.7 Identification Number

Dimensional reference identification numbers are assigned to ring-joint gaskets and are shown in Tables 3 through 8.

3 SPIRAL-WOUND GASKETS

3.1 Size and Class

Spiral-wound gaskets, including centering ring and inner ring (paras. 3.2.4 and 3.2.5), are identified by flange size (NPS), pressure class, and the appropriate flange standard (ASME B16.5 or ASME B16.47).

3.2 Dimensions and Tolerances

3.2.1 General. Dimensions and tolerances for spiral-wound gaskets, centering rings, and inner rings shall be in accordance with Tables 9 through 11 and as specified in this section.

3.2.2 Construction. Spiral-wound gaskets shall be constructed as alternate plies (circular layers counted as revolutions) of preformed metal windings and plaint fillers that are spirally wound. For the finished gasket, the filler shall be essentially flush with, but not below, the metal winding on both contact faces of the gasket. The metal strip in the winding shall be 0.006 in. to 0.009 in. thick. The filler material thickness shall be determined by the manufacturer.

3.2.3 Metal Joining. The inner windings shall have a minimum of three plies of preformed metal strip without filler. The initial two plies shall be spot-welded circumferentially with a minimum of three welds spaced at a maximum distance of 3 in. The outer windings, which shall have a minimum of three plies of preformed metal without filler, shall be spot-welded circumferentially with a minimum of three welds, the last of which shall be the terminal weld.

The distance of the first weld from the terminal weld shall be no greater than 1.5 in. Up to four additional loose preformed metal windings beyond the terminal weld may be used to retain the gasket into the centering ring.

3.2.4 Centering Ring. All spiral-wound gaskets shall be furnished assembled into a centering ring. The centering ring thickness shall be from 0.117 in. to 0.131 in. and suitably grooved on the inside diameter so as to retain the gasket.

3.2.5 Inner Ring. Inner rings shall be furnished with all spiral-wound gaskets having PTFE (polytetrafluoroethylene) filler material. It is recommended that inner rings be specified by the user for flexible graphite and other filler materials (if appropriate for flanges and bore sizes used), particularly where experience has demonstrated inward buckling of the gaskets to be a problem. Inner rings shall be furnished in spiral-wound gaskets for flanges NPS 24 and larger in Class 900, NPS 12 and larger in Class 1500, and NPS 4 and larger in Class 2500. Gaskets with inner rings should be used only with socket welding, lapped, welding neck, and integral flanges. (a)

The inner-ring thickness shall be from 0.117 in. to 0.131 in. Tables 12 through 14 show inner-ring inside diameters that may extend a maximum of 0.06 in. into the flange bore under the worst combination of flange bore, eccentric installation, and tolerance. Reference Table 15 for minimum pipe wall thickness for use with gaskets with inner rings. Reference Tables 16, 17, and 18 for maximum allowable bore for use with gaskets without inner rings.

3.2.6 Gasket Compression. Spiral-wound gaskets NPS ½, NPS ¾, and NPS 1 in Classes 150, 300, and 600 shall be designed so that a uniform bolt stress of 25,000 psi, based on the nominal bolt root diameter, will compress the gasket to a thickness of 0.130 in. ±0.005 in. All other gasket sizes and classes shall be designed so that a uniform bolt stress of 30,000 psi will compress the gasket to a thickness of 0.130 in. ±0.005 in.

3.3 Materials

Metal windings and filler materials shall be in accordance with Table 19. The inner ring shall be of a material

STD.ASME B16.20A-ENGL 2000 ■ 0759670 0617684 003 ■

that has corrosion resistant characteristics equivalent to or better than that of the metal winding. The centering ring may be carbon steel that is painted, metal plated, or otherwise coated to inhibit atmospheric corrosion.

TABLE 12 INNER-RING INSIDE DIAMETERS FOR SPIRAL-WOUND GASKETS (a)

Flange Size (NPS)	Pressure Class						
	150	300	400 (1)	600	900 (1, 2)	1500 (2, 3)	2500 (1–3)
½	0.56	0.56	...	0.56	...	0.56	0.56
¾	0.81	0.81	...	0.81	...	0.81	0.81
1	1.06	1.06	...	1.06	...	1.06	1.06
1¼	1.50	1.50	...	1.50	...	1.31	1.31
1½	1.75	1.75	...	1.75	...	1.63	1.63
2	2.19	2.19	...	2.19	...	2.06	2.06
2½	2.62	2.62	...	2.62	...	2.50	2.50
3	3.19	3.19	...	3.10	3.10	3.10	3.10
4	4.19	4.19	4.04	4.04	4.04	3.85	3.85
5	5.19	5.19	5.05	5.05	5.05	4.90	4.90
6	6.19	6.19	6.10	6.10	6.10	5.80	5.80
8	8.50	8.50	8.10	8.10	7.75	7.75	7.75
10	10.56	10.56	10.05	10.05	9.69	9.69	9.69
12	12.50	12.50	12.10	12.10	11.50	11.50	11.50
14	13.75	13.75	13.50	13.50	12.63	12.63	...
16	15.75	15.75	15.35	15.35	14.75	14.50	...
18	17.69	17.69	17.25	17.25	16.75	16.75	...
20	19.69	19.69	19.25	19.25	19.00	18.75	...
24	23.75	23.75	23.25	23.25	23.25	22.75	...

GENERAL NOTES:

(a) The inner-ring thickness shall be 0.117 in. to 0.131 in.

(b) For sizes NPS 1¼ through NPS 3, the inside diameter tolerance is ±0.03 in.; for larger sizes the inside diameter tolerance is ±0.06 in. See Table 15 for minimum pipe wall thicknesses that are suitable for use with standard inner rings.

NOTES:

(1) There are no
  (a) NPS ½ through NPS 3 Class 400 flanges; therefore, use Class 600 flanges
  (b) NPS ½ through NPS 2½ Class 900 flanges; therefore, use Class 1500 flanges
  (c) NPS 14 and larger Class 2500 flanges

(2) Inner rings are required for Class 900, NPS 24 gaskets; Class 1500, NPS 12 through NPS 24 gaskets; and Class 2500, NPS 4 through NPS 12 gaskets.

(3) Refer to para. 3.2.5 for required use of inner rings.

ASME Services

ASME is committed to developing and delivering technical information. At ASME's Information Central, we make every effort to answer your questions and expedite your orders. Our representatives are ready to assist you in the following areas:

ASME Press
Codes & Standards
Credit Card Orders
IMechE Publications
Meetings & Conferences
Member Dues Status
Member Services & Benefits
Other ASME Programs
Payment Inquiries
Professional Development
Short Courses
Publications
Public Information
Self-Study Courses
Shipping Information
Subscriptions/Journals/Magazines
Symposia Volumes
Technical Papers

How can you reach us? It's easier than ever!

There are four options for making inquiries* or placing orders. Simply mail, phone, fax, or E-mail us and an Information Central representative will handle your request.

Date of Issuance: April 28, 2000

The 1998 edition of this Standard is being issued with an automatic addenda subscription service. The use of addenda allows revisions made in response to public review comments or committee actions to be published on a regular yearly basis; revisions published in addenda will become effective 6 months after the Date of Issuance of the addenda. The next edition of this Standard is scheduled for publication in 2003.

ASME issues written replies to inquiries concerning interpretations of technical aspects of this Standard. The interpretations will be included with the above addenda service.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assumes any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

Ring-joint gaskets and grooves probably originated in the boiler field, where they were used in various forms for manhole covers, autoclaves, and other closures; however, it was in the oil industry (both in the production and refining of oil) that they received the greatest recognition and were developed into their present form. Their use expanded steadily as temperatures and pressures were increased in steam plants. Tests examining their application in flanges and valves were conducted as early as 1928.

In June 1936, the American Petroleum Institute (API) issued Tentative Standard 5-G-3 on Ring-Joints for Steel Flanges and Flange Unions for use with API Tubular Goods. This standard was known as API Specification 6B, Ring-Joint Flanges. Following the acceptance of ring-joints for flanges and valves by API and the issuance of their standard, ASA B16e on Steel Pipe Flanges and Flanged Fittings was revised to include them, and the 1939 edition included standard dimensions for a full line of ring-joint flanges based on the API standard. Development work continued, and API formulated Standard 6E, Specification for Wellhead Equipment, which included ring-joints not covered in ASA B16e-1939.

In 1949, the American Standards Association (ASA), Sectional Committee B16, Subcommittee 3, Steel Flanges and Flanged Fittings, assembled the available information on ring-joint gaskets into a single standard. ASA approval was granted on April 30, 1952, with the designation ASA B16.20-1952.

Ring gaskets for Class 900 (900 lb at that time) in sizes NPS 26 through 36 were added, and ASA approval was granted on April 30, 1952.

An updated version was submitted, and ASA approval was granted on April 4, 1955, with the designation ASA B16.20-1955. The standard was reviewed, and reaffirmation approval was granted by the ASA on April 25, 1963.

The standard was reviewed, and reaffirmation approval was granted by the American National Standards Institute (ANSI) on April 25, 1973, with the designation of an American National Standard.

API requested that ASME convert their gasket standard, API 601, into an ASME American National Standard. As a result of that request, this edition was expanded to include requirements for spiral-wound and jacketed gaskets that were formerly listed in API 601, 7th edition, 1988. Also, ring-joint groove dimensions are not included in this edition because they are included in ASME/ANSI B16.5-1988, titled Pipe Flanges and Flanged Fittings, and ASME B16.47-1990, titled Large Diameter Steel Flanges.

The 1993 edition was approved by the B16 Standards Committee. Following approval by ASME, approval by ANSI was given on January 22, 1993, with the designation ASME B16.20-1993.

In the 1998 edition of ASME B16.20, reference standards are updated, a quality system program annex is added, inner ring inside diameters for spiral-wound gaskets are revised, and several editorial revisions are made. Following approval by ASME B16 Subcommittee B and the B16 Main Committee, ANSI approved this American National Standard on November 20, 1998.

Requests for interpretations or suggestions for revision should be sent to The American Society of Mechanical Engineers; Secretary, B16 Committee; Three Park Avenue, New York, New York 10016-5990.

CORRESPONDENCE WITH THE B16 COMMITTEE

General. ASME Standards are developed and maintained with the intent to represent the consensus of concerned interests. As such, users of this Standard may interact with the Committee by requesting interpretations, proposing revisions, and attending Committee meetings. Correspondence should be addressed to:

Secretary, B16 Main Committee
The American Society of Mechanical Engineers
Three Park Avenue
New York, NY 10016-5990

Proposing Revisions. Revisions are made periodically to the Standard to incorporate changes that appear necessary or desirable, as demonstrated by the experience gained from the application of the Standard. Approved revisions will be published periodically.

The Committee welcomes proposals for revisions to this Standard. Such proposals should be as specific as possible, citing the paragraph number(s), the proposed wording, and a detailed description of the reasons for the proposal, including any pertinent documentation.

Interpretations. Upon request, the B16 Committee will render an interpretation of any requirement of the Standard. Interpretations can only be rendered in response to a written request sent to the Secretary of the B16 Main Committee.

The request for interpretation should be clear and unambiguous. It is further recommended that the inquirer submit his/her request in the following format:

Subject:	Cite the applicable paragraph number(s) and the topic of the inquiry.
Edition:	Cite the applicable edition of the Standard for which the interpretation is being requested.
Question:	Phrase the question as a request for an interpretation of a specific requirement suitable for general understanding and use, not as a request for an approval of a proprietary design or situation. The inquirer may also include any plans or drawings, which are necessary to explain the question; however, they should not contain proprietary names or information.

Requests that are not in this format will be rewritten in this format by the Committee prior to being answered, which may inadvertently change the intent of the original request.

ASME procedures provide for reconsideration of any interpretation when or if additional information that might affect an interpretation is available. Further, persons aggrieved by an interpretation may appeal to the cognizant ASME Committee or Subcommittee. ASME does not "approve," "certify," "rate," or "endorse" any item, construction, proprietary device, or activity.

Attending Committee Meetings. The B16 Main Committee regularly holds meetings, which are open to the public. Persons wishing to attend any meeting should contact the Secretary of the B16 Main Committee.

IMPORTANT INFORMATION CONCERNING USE OF ASBESTOS OR ALTERNATIVE MATERIALS

Asbestos is referenced for use as a filler material in metallic gaskets. It has served as a universal sealing material, compatible with most fluid services. It has been of extreme usefulness in minimizing fire hazards.

Certain serious adverse health effects are associated with asbestos, among them the serious and often fatal diseases of lung cancer, asbestosis, and mesothelioma (a cancer of the chest and abdominal linings). The degree of exposure to asbestos varies with the product and the work practices involved.

Consult the most recent edition of the Occupational Safety and Health Administration, U.S. Department of Labor, Occupational Safety and Health Standard for Asbestos, Tremolite, Anthophyllite, and Actinolite, 29 Code of Federal Regulations Section 1910.1001; the U.S. Environmental Protection Agency, National Emission Standard for Asbestos, 40 Code of Federal Regulations Sections 61.140 through 61.156; and the proposed rule by the U.S. Environmental Protection Agency proposing labeling requirements and phased banning of asbestos products, published at 51 Federal Register 3738-3759 (January 29, 1986).

There are currently in use and under development a number of substitute materials to replace asbestos in certain applications. Manufacturers and users are encouraged to develop and use effective substitute materials that can meet the specifications for, and operating requirements of, the equipment to which they would apply.

Information concerning safety and health risks and proper precautions with respect to particular materials and conditions should be obtained from one's employer, the manufacturer or supplier of that material, or the Material Safety Data Sheet.

METALLIC GASKETS FOR PIPE FLANGES

Ring-Joint, Spiral-Wound, and Jacketed

1 SCOPE

1.1 General

This Standard covers materials, dimensions, tolerances, and markings for metal ring-joint gaskets, spiral-wound metal gaskets, metal-jacketed gaskets, and filler material. These gaskets are dimensionally suitable for use with flanges described in reference flange standards ASME B16.5, ASME B16.47, and API Specification 6A. This Standard covers spiral-wound metal gaskets and metal-jacketed gaskets for use with raised-face and flat-face flanges.

1.2 Quality Systems

Requirements relating to the product manufacturers' quality system programs are described in Annex A.

1.3 References

Standards and specifications adopted by reference in this Standard are shown in Annex I, which is part of this Standard.

2 RING-JOINT GASKETS

2.1 Types

Ring-joint gaskets shall be either octagonal or oval in cross section.

2.2 Size

Ring-joint gaskets shall be identified by an R, RX, or BX number that relates to flange size (NPS), pressure class, and the appropriate flange standards (ASME B16.5, ASME B16.47, or API Specification 6A).

2.3 Materials

2.3.1 General. Ring-joint gasket materials, some of which are listed in Table 1, shall be selected by the user based on suitability for the service conditions.

TABLE 1 MAXIMUM HARDNESS FOR RING GASKETS

Ring Gasket Material	Maximum Hardness	
	Brinell	Rockwell "B" Scale
Soft iron (1)	90	56
Low-carbon steel	120	68
4–6 chrome ½Mo	130	72
Type 410	170	86
Type 304	160	83
Type 316	160	83
Type 347	160	83

NOTE:
(1) May be low-carbon steel, not to exceed maximum hardness of 90 Brinell—56 Rockwell "B."

It is recommended that ring-joint gaskets be of a lesser hardness than that of the mating flanges.

2.3.2 Hardness. Ring-joint gaskets of materials listed in Table 1 shall have a hardness equal to or less than that shown in Table 1.

2.4 Marking

The outer surface of each gasket shall carry the manufacturer's name or identification trademark and gasket number prefixed by the letters R, RX, or BX followed by the gasket material identification. Materials shall be identified as shown in Table 2. The gasket shall also be marked with an ASME B16.20 designation. The marking shall be applied so as not to harmfully distort the gasket or affect the integrity of the seal.

2.5 Dimensions and Tolerances

Dimensions and tolerances for ring-joint gaskets shall be as shown in Tables 3 through 8.

2.6 Surface Finish

Types R and RX gaskets shall have a finish not rougher than 63 μin. roughness. Type BX gaskets shall have a finish not rougher than 32 μin. roughness. Surface finishes shall pertain to the gasket-sealing surfaces.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:48:10 2005

TABLE 2 RING GASKET MARKINGS

Ring Gasket Material	Identification	Marking Example (1)
Soft iron (2)	D	R51D
Low-carbon steel	S	R51S
4–6 chrome ½Mo	F5 (3)	R51F5
Type 410	S 410	R51S410
Type 304	S 304	R51S304
Type 316	S 316	R51S316
Type 347	S 347	R51S347

NOTES:
(1) This number shall be preceded by the manufacturer's name or identification trademark.
(2) May be low-carbon steel, not to exceed maximum hardness of 90 Brinell—56 Rockwell "B."
(3) F5 identification designates ASTM Specification A 182-72 chemical composition requirements only.

2.7 Identification Number

Dimensional reference identification numbers are assigned to ring-joint gaskets and are shown in Tables 3 through 8.

3 SPIRAL-WOUND GASKETS

3.1 Size and Class

Spiral-wound gaskets, including centering ring and inner ring (paras. 3.2.4 and 3.2.5), are identified by flange size (NPS), pressure class, and the appropriate flange standard (ASME B16.5 or ASME B16.47).

3.2 Dimensions and Tolerances

3.2.1 General. Dimensions and tolerances for spiral-wound gaskets, centering rings, and inner rings shall be in accordance with Tables 9 through 11 and as specified in this section.

3.2.2 Construction. Spiral-wound gaskets shall be constructed as alternate plies (circular layers counted as revolutions) of preformed metal windings and plaint fillers that are spirally wound. For the finished gasket, the filler shall be essentially flush with, but not below, the metal winding on both contact faces of the gasket. The metal strip in the winding shall be 0.006 in. to 0.009 in. thick. The filler material thickness shall be determined by the manufacturer.

3.2.3 Metal Joining. The inner windings shall have a minimum of three plies of preformed metal strip without filler. The initial two plies shall be spot-welded circumferentially with a minimum of three welds spaced at a maximum distance of 3 in. The outer windings, which shall have a minimum of three plies of preformed metal without filler, shall be spot-welded circumferentially with a minimum of three welds, the last of which shall be the terminal weld.

The distance of the first weld from the terminal weld shall be no greater than 1.5 in. Up to four additional loose preformed metal windings beyond the terminal weld may be used to retain the gasket into the centering ring.

3.2.4 Centering Ring. All spiral-wound gaskets shall be furnished assembled into a centering ring. The centering ring thickness shall be from 0.117 in. to 0.131 in. and suitably grooved on the inside diameter so as to retain the gasket.

3.2.5 Inner Ring. Inner rings shall be furnished with all spiral-wound gaskets having PTFE (polytetrafluoroethylene) filler material. It is recommended that inner rings be specified by the user for flexible graphite and other filler materials (if appropriate for flanges and bore sizes used), particularly where experience has demonstrated inward buckling of the gaskets to be a problem. Inner rings shall be furnished in spiral-wound gaskets for flanges NPS 24 and larger in Class 900, NPS 12 and larger in Class 1500, and NPS 4 and larger in Class 2500. Gaskets with inner rings should be used only with socket welding, lapped, welding neck, and integral flanges.

The inner-ring thickness shall be from 0.117 in. to 0.131 in. Tables 12 through 14 show inner-ring inside diameters that may extend a maximum of 0.06 in. into the flange bore under the worst combination of flange bore, eccentric installation, and tolerance.

3.2.6 Gasket Compression. Spiral-wound gaskets NPS ½, NPS ¾, and NPS 1 in Classes 150, 300, and 600 shall be designed so that a uniform bolt stress of 25,000 psi, based on the nominal bolt root diameter, will compress the gasket to a thickness of 0.130 in. ±0.005 in. All other gasket sizes and classes shall be designed so that a uniform bolt stress of 30,000 psi will compress the gasket to a thickness of 0.130 in. ±0.005 in.

3.3 Materials

Metal windings and filler materials shall be in accordance with Table 19. The inner ring shall be of a material that has corrosion resistant characteristics equivalent to or better than that of the metal winding. The centering ring may be carbon steel that is painted, metal plated, or otherwise coated to inhibit atmospheric corrosion.

Copyright by the American Society Of Mechanical Engineers
Wed Feb 02 00:48:10 2005

3.4 Marking

3.4.1 General. The centering ring of each spiral-wound gasket shall be permanently marked. The lettering height shall be a minimum of 0.1 in. The following information shall be included with the centering ring markings:

(a) Manufacturer's name or trademark.

(b) Flange size (NPS).

(c) Pressure class.

(d) Winding metal abbreviation (Table 19), except that the abbreviation may be omitted when 304 stainless steel is used.

(e) Filler material abbreviation (Table 19).

(f) Centering and inner ring metal abbreviation (Table 19), except that the abbreviation may be omitted when carbon steel is used for the outer ring and 304 stainless steel is used for the inner ring.

(g) Flange identification. Gaskets intended for ASME B16.47 flanges shall be marked B16.47 A or B16.47 B, as applicable. Gaskets intended for ASME B16.5 flanges need not be so marked. Illustrative marking examples are shown in Table 20.

(h) ASME B16.20 designation.

3.4.2 Pressure Class. Gaskets suitable for more than one pressure class shall be marked with all applicable classes, as shown in Table 20.

3.4.3 Color Coding. Spiral-wound gaskets shall be marked with a color code that identifies the windings and filler materials. A continuous color around the outer edge of the centering ring shall identify the winding metal. The color identifying the filler material for NPS $1\frac{1}{2}$ and larger shall have four intermittent stripes spaced approximately 90 deg apart on the outer edge of the centering ring. Smaller size gaskets shall have a minimum of two stripes 180 deg apart. The colors shall conform to those listed in Table 19.

4 JACKETED GASKETS

4.1 Size and Pressure Class

Jacketed gaskets are identified by flange size (NPS), pressure class, and the appropriate flange standard (ASME B16.5 or ASME B16.47).

4.2 Design

4.2.1 General. Jacketed gaskets shall be made with a filler material enclosed in a metal jacket.

4.2.2 Jacket Thickness. The jacket metal thickness shall be a minimum of 0.015 in.

4.2.3 Filler Thickness. The filler thickness shall be a minimum of 0.06 in.

4.2.4 Miscellaneous. Other design details, including the density of the filler, shall be the gasket manufacturer's responsibility.

4.3 Dimensions and Tolerances

Gasket dimensions and tolerances shall be in accordance with Tables 21, 22, or 23.

4.4 Materials

Metal jacket and filler material shall be selected from Table 24. For jacketed gasket limitations related to ASME B16.5 applications, see Annex E of ASME B16.5.

4.5 Marking

4.5.1 Applied Marking. Jacketed gaskets shall be marked with waterproof ink or equivalent. Where gasket size does not permit such markings, a separate attached marking tag may be used. The lettering height shall be a minimum of 0.2 in. The following information shall be included with the markings:

(a) Manufacturer's name or trademark.

(b) Flange size (NPS).

(c) Pressure class.

(d) Jacketed material abbreviation (Table 24), except that the abbreviation may be omitted when soft carbon steel is used.

(e) Filler material abbreviation (Table 24).

(f) Flange identification. Gaskets intended for ASME B16.47 flanges shall be marked B16.47 A or B16.47 B, as applicable. Gaskets intended for ASME B16.5 flanges need not be so marked. Illustrative marking examples are shown in Table 25.

(g) ASME B16.20 designation.

4.5.2 Pressure Class. Gaskets suitable for more than one pressure class shall be marked with all applicable classes.

R-105	40.250	1.375	...	1.63	0.977	0.09

GENERAL NOTE: All dimensions are in inches.

TOLERANCES:

P = average pitch diameter of ring, ±0.007
A = width of ring, ±0.008
B, H = height of ring, +0.05, −0.02
Variation in height throughout the entire circumference of any given ring shall not exceed 0.02 within these tolerances.
C = width of flat on octagonal ring, ±0.008
R_1 = radius in ring, ±0.02
23 deg = angle, ±½ deg

RX-215	5.547	0.469	0.210	0.167 (2)	1.000	0.06 (3)	...

GENERAL NOTE: All dimensions are in inches.

NOTES:

(1) Rings RX-82 through RX-91 only require one pressure passage hole as illustrated. The center line of the hole shall be located at the midpoint of dimension *C*.

(2) Tolerance on these dimensions is +0, −0.015.

(3) Tolerance on these dimensions is +0.02, −0.

TOLERANCES:

OD = outside diameter of ring, +0.020, −0

A = width of ring, +0.008, −0
Variation in width throughout the entire circumference of any ring shall not exceed 0.004 within these tolerances.

C = width of flat, +0.006, −0

D = height of outside bevel, +0, −0.03

H = height of ring, +0.008, −0
Variation in height throughout the entire circumference of any ring shall not exceed 0.004 within these tolerances.

R_1 = radius of ring, ±0.02

23 deg = angle, $\pm\frac{1}{2}$ deg

E = hole size, ±0.02

NOTES TO TABLE 7 (CONT'D)

NOTE:
(1) One pressure passage hole is required per gasket as illustrated. The center line of the hole shall be located at the midpoint of dimension *C*.

TOLERANCES:
OD = (outside diameter of ring) +0, −0.005
H = (height of ring) +0.008, −0
Variation in height throughout the entire circumference of any ring shall not exceed 0.004 within these tolerances.
A = (width of ring) +0.008, −0
Variation in width throughout the entire circumference of any ring shall not exceed 0.004 within these tolerances.
ODT = (outside diameter of flat) ±0.002
C = (width of flat) +0.006, −0
D = (hole size) ±0.02
R = (radius of ring) see General Note (b)
23 deg = (angle) ±1/4 deg

GENERAL NOTES:
(a) For reference, see Table 9 illustration beginning on previous page.
(b) The gasket–thickness tolerance is ±0.005 in. measured across the metallic portion of the gasket not including the filler, which may protrude slightly beyond the metal.
(c) For limitations on the maximum flange bore for use with these spiral-wound gaskets, see Table 16.

NOTES:
(1) Inner rings are required for all PTFE filled gaskets and for Class 900 gaskets, NPS 24; Class 1500 gaskets, NPS 12 through NPS 24; and Class 2500 gaskets, NPS 4 through NPS 12 (see para. 3.2.5 and Table 12).
(2) The gasket outside diameter tolerance for NPS ½ through NPS 8 is ±0.03 in.; for NPS 10 through NPS 24, +0.06 in., −0.03 in.
(3) The gasket inside diameter tolerance for NPS ½ through NPS 8 is ±0.016 in.; for NPS 10 through NPS 24, ±0.03 in.
(4) The centering ring outside diameter tolerance is ±0.03 in.
(5) There are no Class 400 flanges in NPS ½ through NPS 3 (use Class 600), Class 900 flanges in NPS ½ through NPS 2½ (use Class 1500), or Class 2500 flanges NPS 14 and larger.

GENERAL NOTES:
(a) For reference, see Table 10 illustration beginning on previous page.
(b) The gasket-thickness tolerance is ±0.005 in. measured across the metallic portion of the gasket not including the filler, which may protrude slightly beyond the metal.
(c) For limitations on the maximum flange bore for use with these spiral-wound gaskets, see Table 17.
(d) ASME B16.47 Series A flanges NPS 12 through NPS 24 have the same raised face dimensions as ASME B16.5 flanges.

NOTES:
(1) Inner rings are required for all PTFE gaskets and Class 900 gaskets, NPS 26 through NPS 48 (see para. 3.2.5 and Table 13).
(2) The gasket inside diameter tolerance for NPS 26 through NPS 34 is ±0.03 in., and the tolerance for NPS 36 through NPS 60 is ±0.05 in.
(3) The gasket outside diameter tolerance for NPS 26 through NPS 60 is ±0.06 in.
(4) The centering ring outside diameter tolerance is ±0.03 in.
(5) There are no Class 900 flanges NPS 50 and larger.

GENERAL NOTES:
(a) For reference, see Table 11 illustration beginning on previous page.
(b) The gasket-thickness tolerance is ±0.005 in. measured across the metallic portion of the gasket not including the filler, which may protrude slightly beyond the metal.
(c) For limitations on the maximum flange bore for use with these spiral-wound gaskets, see Table 18.

NOTES:
(1) Inner rings are required for all PTFE gaskets and for Class 900 gaskets, NPS 26 through NPS 48 (see para. 3.2.5 and Table 14).
(2) The gasket inside diameter tolerance for NPS 26 through NPS 34 is ±0.03 in., and the tolerance for NPS 36 through NPS 60 is ±0.05 in.
(3) The gasket outside diameter tolerance for NPS 26 through NPS 60 is ±0.06 in.
(4) The centering ring outside diameter tolerance is ±0.03 in.
(5) There are no Class 900 flanges NPS 50 and larger.

8	8.50	8.50	8.10	8.10	7.75	7.75	7.75
10	10.56	10.56	10.05	10.05	9.69	9.69	9.69
12	12.50	12.50	12.10	12.10	11.50	11.50	11.50
14	13.75	13.75	13.50	13.50	12.63	12.63	...
16	15.75	15.75	15.35	15.35	14.75	14.50	...
18	17.69	17.69	17.25	17.25	16.75	16.75	...
20	19.69	19.69	19.25	19.25	19.00	18.75	...
24	23.75	23.75	23.25	23.25	23.25	22.75	...

GENERAL NOTES:

(a) The inner-ring thickness shall be 0.117 in. to 0.131 in.

(b) For sizes NPS 1¼ through NPS 3, the inside diameter tolerance is ±0.03 in.; for larger sizes the inside diameter tolerance is ±0.06 in. See Table 15 for minimum pipe wall thicknesses that are suitable for use with standard inner rings.

NOTES:

(1) There are no Class 400 flanges NPS ½ through NPS 3 (use Class 600), Class 900 flanges NPS ½ through NPS 2½ (use Class 1500), or Class 2500 flanges NPS 14 and larger.

(2) Inner rings are required for Class 900, NPS 24 gaskets; Class 1500, NPS 12 through NPS 24 gaskets; and Class 2500, NPS 4 through NPS 12 gaskets.

(3) The inner-ring inside diameters shown for NPS 1¼ through NPS 2½ in Class 1500 and 2500 will produce inner-ring widths of 0.12 in., a practical minimum for production purposes.

GENERAL NOTES:
(a) This table shows the maximum bore of flanges for which the spiral-wound gasket dimensions shown in Table 9 are recommended considering the tolerances involved, possible eccentric installation, and the possibility that the gasket may extend into the assembled flange bore.
(b) For maximum permissible flange bores for nonmandatory inner rings, see Table 15.
(c) Abbreviations: SO = slip on and threaded WN = welding neck SW = standard wall

NOTES:
(1) Inner rings are required for Class 900 gaskets, NPS 24; Class 1500 gaskets, NPS 12 through NPS 24; and Class 2500 gaskets, NPS 4 through NPS 12 (see para. 3.2.5). These inner rings may extend into the pipe bore a maximum of 0.06 in. under the worst combination of maximum bore, eccentric installation, and additive tolerances.
(2) In these sizes the gasket is suitable for a welding neck flange with a standard wall bore, if the gasket and the flanges are assembled concentrically. This also applies to a nozzle. It is the user's responsibility to determine if the gasket is satisfactory for a flange of any larger bore.
(3) Gaskets in these sizes are suitable for slip-on flanges only if the gaskets and flanges are assembled concentrically.
(4) A *nozzle* is a long welding neck; the bore equals the flange NPS.
(5) An NPS 24 gasket is suitable for nozzles.

TABLE 17 MAXIMUM BORE OF ASME B16.47 SERIES A FLANGES FOR USE WITH SPIRAL-WOUND GASKETS

Flange Size (NPS)	Pressure Class				
	150	300	400	600	900 (1)
26	(2)	(3)	(3)	(3)	(3)
28	(2)	(3)	(3)	(3)	(3)
30	(2)	(3)	(3)	(3)	(3)
32	(2)	(3)	(3)	(3)	(3)
34	(2)	(3)	(3)	(3)	(3)
36	(2)	(3)	(3)	(3)	(3)
38	(2)	(3)	(3)	(3)	(3)
40	(2)	(3)	(3)	(3)	(3)
42	(2)	(3)	(3)	(3)	(3)
44	(2)	(3)	(3)	(3)	(3)
46	(2)	(3)	(3)	(3)	(3)
48	(2)	(3)	(3)	(3)	(3)
50	(2)	(3)	(3)	(3)	(4)
52	(2)	(3)	(3)	(3)	(4)
56	(2)	(3)	(3)	(3)	(4)
58	(2)	(3)	(3)	(3)	(4)
60	(2)	(3)	(3)	(3)	(4)

GENERAL NOTE: This table shows the maximum bore of flanges for which the spiral-wound gasket dimensions shown in Table 10 are recommended, considering the tolerances involved, the possibility of eccentric installation, and the possibility that the gasket may extend into the assembled flange bore.

NOTES:

(1) Inner rings are required for Class 900 gaskets, NPS 26 through NPS 48 (see para. 3.2.5).

(2) Applies only to welding neck flanges with a bore not larger than the inside diameter of a 0.187-in. wall pipe. Larger bores must be checked individually.

(3) Applies only to welding neck flanges with a bore not larger than the inside diameter of a 0.25-in. wall pipe, except that NPS 38, Class 300, is not suitable for a bore larger than the inside diameter of a 0.30-in. wall pipe. Larger bores must be checked individually.

(4) There are no Class 900 flanges in NPS 50 through 60.

24	25.25	28.13	30.38	30.13	31.00	32.88	35.38	...

GENERAL NOTE: The gasket-thickness tolerance is +0.03 in., −0.000 in.

NOTES:

(1) For gaskets NPS ½ through NPS 24, the outside and inside diameter tolerances are +0.06 in., −0.000 in.

(2) There are no Class 400 flanges NPS ½ through NPS 3 (use Class 600).

(3) There are no Class 900 flanges NPS ½ through NPS 2½ (use Class 1500).

(4) There are no Class 2500 flanges NPS 14 and larger.

NONMANDATORY ANNEX A
QUALITY SYSTEM PROGRAM

The products manufactured in accordance with this Standard shall be produced under a quality system program following the principles of an appropriate standard from the ISO 9000 series.[1] A determination of the need for registration and/or certification of the product manufacturer's quality system program by an independent organization shall be the responsibility of the manufacturer. Detailed documentation demonstrating program compliance shall be available to the purchaser at the manufacturer's facility. A written, summarized description of the program used by the product manufacturer shall be available to the purchaser upon request. The product manufacturer is defined as the entity whose name or trademark appears on the product in accordance with the marking or identification requirements of this Standard.

---

[1] The series is also available from the American National Standards Institute (ANSI) and the American Society for Quality (ASQ) as American National Standards that are identified by a prefix "Q" replacing the prefix "ISO". Each standard of the series is listed in Annex I.

ASME Services

ASME is committed to developing and delivering technical information. At ASME's Information Central, we make every effort to answer your questions and expedite your orders. Our representatives are ready to assist you in the following areas:

ASME Press
Codes & Standards
Credit Card Orders
IMechE Publications
Meetings & Conferences
Member Dues Status
Member Services & Benefits
Other ASME Programs
Payment Inquiries
Professional Development
Short Courses
Publications
Public Information
Self-Study Courses
Shipping Information
Subscriptions/Journals/Magazines
Symposia Volumes
Technical Papers

How can you reach us? It's easier than ever!

There are four options for making inquiries* or placing orders. Simply mail, phone, fax, or E-mail us and an Information Central representative will handle your request.

Mail	*Call Toll Free*	*Fax-24 hours*	*E-Mail-24 hours*

AMERICAN NATIONAL STANDARDS FOR PIPING, PIPE FLANGES, FITTINGS, AND VALVES

Scheme for the Identification of Piping Systems A13.1-1996
Pipe Threads, General Purpose (Inch) ..... B1.20.1-1983(R1992)
Dryseal Pipe Threads (Inch) ..... B1.20.3-1976(R1991)
Cast Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250 ..... B16.1-1998
Malleable Iron Threaded Fittings: Classes 150 and 300 ..... B16.3-1998
Gray Iron Threaded Fittings: Classes 125 and 250 ..... B16.4-1998
Pipe Flanges and Flanged Fittings (NPS ½ Through NPS 24) B16.5-1996
Factory-Made Wrought Steel Buttwelding Fittings B16.9-1993
Face-to-Face and End-to-End Dimensions of Valves B16.10-1992
Forged Fittings, Socket-Welding and Threaded B16.11-1996
Cast Iron Threaded Drainage Fittings B16.12-1998
Ferrous Pipe Plugs, Bushings, and Locknuts with Pipe Threads B16.14-1991
Cast Bronze Threaded Fittings: Classes 125 and 250 ..... B16.15-1985(R1994)
Cast Copper Alloy Solder Joint Pressure Fittings ..... B16.18-1984(R1994)
Metallic Gaskets for Pipe Flanges: Ring-Joint, Spiral-Wound, and Jacketed B16.20-1998
Nonmetallic Flat Gaskets for Pipe Flanges B16.21-1992
Wrought Copper and Copper Alloy Solder Joint Pressure Fittings B16.22-1995
Cast Copper Alloy Solder Joint Drainage Fittings — DWV B16.23-1992
Cast Copper Alloy Pipe Flanges and Flanged Fittings: Classes 150, 300, 400, 600, 900, 1500, and 2500 ..... B16.24-1991(R1998)
Buttwelding Ends B16.25-1997
Cast Copper Alloy Fittings for Flared Copper Tubes B16.26-1988
Wrought Steel Buttwelding Short Radius Elbows and Returns B16.28-1994
Wrought Copper and Wrought Copper Alloy Solder Joint Drainage Fittings — DWV B16.29-1994
Manually Operated Metallic Gas Valves for Use in Gas Piping Systems up to 125 psig (Sizes ½ Through 2) B16.33-1990
Valves — Flanged, Threaded, and Welding End B16.34-1996
Orifice Flanges B16.36-1996
Large Metallic Valves for Gas Distribution (Manually Operated, NPS 2½ to 12, 125 psig Maximum) ..... B16.38-1985(R1994)
Malleable Iron Threaded Pipe Unions B16.39-1998
Manually Operated Thermoplastic Gas Shutoffs and Valves in Gas Distribution Systems ..... B16.40-1985(R1994)
Ductile Iron Pipe Flanges and Flanged Fittings, Classes 150 and 300 ..... B16.42-1998
Manually Operated Metallic Gas Valves for Use in House Piping Systems B16.44-1995
Cast Iron Fittings for Sovent® Drainage Systems B16.45-1998
Large Diameter Steel Flanges (NPS 26 Through NPS 60) B16.47-1996
Steel Line Blanks B16.48-1997
Power Piping B31.1-1995
Fuel Gas Piping (not an ANSI standard) B31.2-1968
Process Piping B31.3-1999
Pipeline Transportation Systems for Liquid Hydrocarbons and Other Liquids B31.4-1992
Refrigeration Piping B31.5-1992
Gas Transmission and Distribution Piping Systems B31.8-1995
Building Services Piping B31.9-1996
Slurry Transportation Piping Systems B31.11-1989
Manual for Determining the Remaining Strength of Corroded Pipelines B31G-1991
Welded and Seamless Wrought Steel Pipe B36.10M-1996
Stainless Steel Pipe ..... B36.19M-1985(R1994)
Self-Operated and Power-Operated Safety-Related Valves Functional Specification Standard ..... N278.1-1975(R1992)

ASME-B16.21

ADOPTION NOTICE

ASME-B16.21, "Gaskets, Flat, Nonmetallic, for Pipe Flanges," was adopted on October 3, 1994, for use by the Department of Defense (DoD). Proposed changes by DoD activities must be submitted to the DoD Adopting Activity: Commander, Defense Industrial Supply Center, Attn: DISC-E, Philadelphia, PA 19111-5096. DoD activities may obtain copies of this standard from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094. The private sector and other Government agencies may purchase copies from the American Society of Mechanical Engineers, 345 East 47th Street, New York, NY 10017.

Date of Issuance: September 30, 1992

The 1992 edition of this Standard is being issued with an automatic addenda subscription service. The use of an addenda allows revisions made in response to public review comments or committee actions to be published as necessary; revisions published in addenda will become effective 6 months after the Date of Issuance of the addenda. The next edition of this Standard is scheduled for publication in 1997.

ASME issues written replies to inquiries concerning interpretations of technical aspects of this Standard. The interpretations will be included with the above addenda service. Interpretations are not part of the addenda to the Standard.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Consensus Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment which provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable Letters Patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations issued in accordance with governing ASME procedures and policies which preclude the issuance of interpretations by individual volunteers.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

(This Foreword is not part of ASME B16.21-1992.)

Several years ago the Standards and Specifications Committee of the Mechanical Packing Association started work on a standard for nonmetallic or cut gaskets for bronze, iron, and steel pipe flanges. Up to that time the individual sizes of gaskets were made to many different sets of dimensions, based on different concepts of adaption and functional use on the part of consumers as well as manufacturers. In some cases dimensions were shown in American Standards.

Dimensions of gaskets being used were collected, and a basic design philosophy for sizing was formulated by the committee. This was the result of extensive field research experience and accepted standard user requirements. The procedure followed was to dimension the gasket for each type and size of flange so as to prevent the gasket from projecting into the line of flow. Dimensional tolerances of standard pipe flanges and fittings as to ID, OD, and bolting were all considered.

Suggested dimensional standards were tabulated and distributed for industry comment. After several revisions a final draft, dated September 15, 1948, was approved by the Mechanical Packing Association for submission as an American Standard.

Sectional Committee (B16) on the Standardization of Pipe Flanges and Fittings was organized in 1921 under the procedure of the American Standards Association, with the Heating, Piping, and Air Conditioning Contractors' National Association, Manufacturers' Standardization Society of the Valve and Fittings Industry, and The American Society of Mechanical Engineers as joint sponsors.

Sectional Committee B16 received the proposal on May 9, 1949, and assigned it to a joint group of Subcommittees 1 and 3. The Manufacturers' Standardization Society was also consulted as the proposal included gaskets for bronze flanges made to their Standard Practice SP-2. This joint group offered a revision of the original design concept for sizing which was acceptable to the Mechanical Packing Association's Committee (now the Fluid Sealing Association). The standard was approved as an American Standard on December 5, 1951, with the designation ASA B16.21-1951.

In 1961, the standard was reviewed by the members of Subcommittee No. 7 on Gaskets and proposals for revision and updating the standard were agreed upon. The American Standards Assocation granted approval of the revision on March 20, 1962 following sectional committee and sponsor approval.

In the mid-1960's work was begun on a revision. The revision became a complete rewrite and included gaskets for API Std 605, MSS SP-44 and SP-51 as well as complete metric equivalents for all dimensions. Following its approval by the B16 Standards Committee and Co-Secretariat organizations, this Standard was approved as an American National Standard by ANSI on May 2, 1978.

In 1982, American National Standards Committee B16 was reorganized as an ASME Committee operating under procedures accredited by ANSI.

In 1989, general revisions were begun to reflect the current size ranges covered by the corresponding flange standards. Gasket dimensions for tongue and groove, male and

female and Rating Classes above 900 were deleted because a survey indicated these nonmetallic gaskets were almost never used for these joints. Tolerances to the dimensions were added.

Following approval by the Standards Committee and ASME, approval as an American National Standard was given by ANSI on March 16, 1992, with the new designation ASME B16.21-1992.

All requests for interpretations or suggestions for revisions should be sent to the Administrative Secretary B16, The American Society of Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, N.Y. 10017.

ASME B16 COMMITTEE
Standardization of Valves, Flanges, Fittings, Gaskets, and Valve Actuators

(The following is the roster of the Committee at the time of approval of this Standard.)

OFFICERS

W. N. McLean, *Chairman*
R. A. Schmidt, *Vice Chairman*
J. Yarmush, *Secretary*

COMMITTEE PERSONNEL

W. L. Ballis, Columbia Gas Distribution Co., Columbus, Ohio
J. E. Batey, Union Carbide Corp., South Charleston, West Virginia
K. M. Bell, Underwriters Laboratories Inc., Northbrook, Illinois
M. L. Blair, US Coast Guard, Washington, D.C.
R. R. Brodin, Fisher Controls International Inc., Marshalltown, Iowa
W. G. Canham, Jr., Brentwood, Missouri
A. Cohen, Copper Development Association, Greenwich, Connecticut
W. C. Farrell, Jr., Stockham Valves and Fittings Inc., Birmingham, Alabama
D. R. Frikken, Monsanto Co., St. Louis, Missouri
M. W. Garland, Frick Co., Waynesboro, Pennsylvania
J. C. Inch, Mueller Brass Co., Hartsville, Tennessee
J. S. John, J Square Engineering Co., Houston, Texas
G. A. Jolly, Henry Vogt Machine Co., Louisville, Kentucky
W. G. Knecht, Anchor/Darling Valve Co., Williamsport, Pennsylvania
R. Koester, The William Powell Co., Cincinnati, Ohio
J. H. Longacre, Nibco Inc., Elkhart, Indiana
J. H. McCauley, Jr., McCauley Mechanical, Chicago, Illinois
W. N. McLean, *Chairman,* Newco Valves, Palos Park, Illinois
A. F. Rhodes, Arnco Technology Trust, Houston, Texas
R. A. Schmidt, *Vice Chairman,* Ladish Co., Russellville, Arkansas
W. M. Stephan, Flexitallic Inc., Pennsauken, New Jersey
T. F. Stroud, Ductile Iron Pipe Research Association, Birmingham, Alabama
R. E. White, Repairs Inc., South Bend, Indiana
D. A. Williams, Southern Company Services, Birmingham, Alabama
D. Wilson, Mobile Pipeline Co., Dallas, Texas

PERSONNEL OF SUBCOMMITTEE G — GASKETS FOR FLANGED JOINTS

W. M. Stephan, *Chairman,* Flexitallic Inc., Pennsauken, New Jersey
J. Yarmush, *Secretary,* ASME, New York, New York.
K. A. Benton, Furon Metallic Gasket Div., Houston, Texas
L. P. Burgess, Standco Industries, Houston, Texas
D. Coomber, Richard Klinger Inc., Sidney, Ohio
